STANDING COMMITTEE

ON

Agriculture and Colonization

Chairman: JAMES A. McBAIN, Esq.

PROCEEDINGS

No. 1-17

Respecting

PRICES OF FARM MACHINERY

THURSDAY, FEBRUARY 2, 1961

MONDAY, MARCH 20, 1961 — SEPTEMBER 26, 1961

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1961

STANDING COMMITTEE
ON
AGRICULTURE and COLONIZATION

Chairman: James A. McBain, Esq.,

Vice-Chairmen: Paul Lahaye, Esq., and C. S. Smallwood, Esq.,
and Messrs.

Argue,
Badanai,
Belzile,
Boulanger,
Brassard (*Lapointe*),
Brunsden,
Campbell (*Lambton-
Kent*),

ORDERS OF REFERENCE

House of Commons,
December 2, 1960.

Resolved,—That the following Members do compose the Standing Committee on Agriculture and Colonization:

No. 6

Agriculture and Colonization

Messrs.

Argue,	Hales,	Peters,
Badanai,	Hardie,	Phillips,
Belzile,	Henderson,	Racine,
Boulanger,	Hicks,	Rapp,
Brassard (<i>Lapointe</i>),	Horner (<i>Acadia</i>),	Regnier,
Brunsdén,	Howe,	Ricard,
Campbell (<i>Lambton-Kent</i>),	Kindt,	Rogers,
Clancy,	Knowles,	Rompère,
Clermont,	Korchinski,	Smallwood,
Cooper,	Lahaye,	Smith (<i>Lincoln</i>),
Danforth,	Leduc,	Southam,
Doucett,	Latour,	Stanton,
Drouin,	McBain,	Stefanson,
Dubois,	McIntosh,	Tardif,
Dupuis,	Michaud,	Thomas,
Fane,	Milligan,	Thompson,
Forbes,	Montgomery,	Tucker,
Forgie,	Muir (<i>Lisgar</i>),	Villeneuve,
Godin,	Nasserden,	Webb—60.
Gundlock,	Noble,	
	Pascoe,	

(Quorum 20)

Ordered,—That the said Committee be empowered to examine and inquire into all such matters and things as may be referred to it by the House; and to report from time to time its observations and opinions thereon, with power to send for persons, papers and records.

THURSDAY, January 19, 1961.

Ordered,—That the name of Mr. Slogan be substituted for that of Mr. Stanton on the Standing Committee on Agriculture and Colonization.

WEDNESDAY, February 8, 1961.

Ordered,—That the Standing Committee on Agriculture and Colonization be empowered to print, from day to day, such papers and evidence as may be ordered by it, and that Standing Order 66 be suspended in relation thereto;

that the quorum of the said Committee be reduced from 20 to 15 Members, and that Standing Order 65(1)(f) be suspended in relation thereto; and that the said Committee be granted leave to sit while the House is sitting.

TUESDAY, March 14, 1961.

Resolved,—That the Standing Committee on Agriculture and Colonization be empowered to continue its inquiry into the question of prices of farm machinery as recommended by the said committee in its Fourth Report presented to the House July 28, 1960, and that the committee's Minutes of Proceedings and Evidence with regard to this inquiry at the last session be referred to the said committee.

Attest.

Léon-J. Raymond,
Clerk of the House.

REPORT TO THE HOUSE

The Standing Committee on Agriculture and Colonization has the honour to present its

First Report

Your Committee recommends:

1. That it be empowered to print, from day to day, such papers and evidence as may be ordered by the Committee, and that Standing Order 66 be suspended in relation thereto.
2. That its quorum be reduced from 20 to 15 members and that Standing Order 65 (1) (f) be suspended in relation thereto.
3. That it be granted leave to sit while the House is sitting.

Respectfully submitted,

JAMES A. McBAIN,
Chairman.

MINUTES OF PROCEEDINGS

THURSDAY, February 2, 1961.

(1)

The Standing Committee on Agriculture and Colonization met at 9.30 a.m. this day for organization purposes.

Members present: (40) Messrs. Argue, Badanai, Brunsdon, Campbell (*Lambton-Kent*), Clermont, Cooper, Danforth, Doucett, Dubois, Fane, Forbes, Godin, Hales, Henderson, Hicks, Horner (*Acadia*), Howe, Knowles, Korchinski, McBain, McIntosh, Montgomery, Muir (*Lisgar*) Nasserden, Noble, Pascoe, Peters, Phillips, Racine, Rapp, Ricard, Rogers, Slogan, Smallwood, Southam, Stefanson, Thomas, Thompson, Tucker and Webb.

Mr. Danforth moved, seconded by Mr. Howe, that Mr. James A. McBain be elected Chairman of the Committee.

On motion of Mr. Noble, seconded by Mr. Rogers, nominations were closed.

Mr. McBain, duly elected Chairman, took the Chair and thanked the Committee for the honour conferred on him. He paid tribute to the late Chairman, Mr. Hayden Stanton, for services rendered.

On motion of Mr. Hales, seconded by Mr. Southam,

Agreed—That on behalf of the Committee, a letter of condolence be sent to Mrs. Hayden Stanton.

Mr. Ricard moved, seconded by Mr. Rogers,

Agreed—That Mr. Paul Lahaye be first Vice-Chairman of the Committee.

Moved by Mr. Henderson, seconded by Mr. Stefanson,

Agreed—That Mr. Clifford Smallwood be second Vice-Chairman of the Committee.

The Orders of Reference having been taken as read, Mr. Argue, seconded by Mr. Peters, moved a motion requesting the Committee to study the feed mills question again. The motion was ruled out of order on the grounds that the Committee could not take anything under study without an order of reference from the House.

Whereupon Mr. Argue, seconded by Mr. Peters, moved the following motion:

“That the Committee request the permission of the House to inquire into the question of feed mills buying wheat, oats and barley at distress prices.”

Following discussion as to whether the motion was in order, the Chairman ruled it in order.

Mr. Muir (*Lisgar*), seconded by Mr. Stefanson, moved in amendment thereto: “That the motion be not now put but that it be referred to the steering Committee.”

Mr. Nasserden, seconded by Mr. Pascoe, moved in amendment: “That the words ‘after July 31st’ be added to Mr. Argue’s motion”.

Mr. McIntosh appealed the Chairman’s ruling on the admissibility of Mr. Argue’s motion.

The Chairman’s ruling was not sustained on the following division:
YEAS, 12; NAYS, 15.

Moved by Mr. Henderson, seconded by Mr. Forbes,

Resolved—That permission be sought to print such papers and evidence as may be ordered by the Committee.

Moved by Mr. Tucker, seconded by Mr. Slogan,

Resolved—That a recommendation be made to the House to reduce the quorum from 20 to 15 members.

Moved by Mr. Southam, seconded by Mr. Slogan,

Resolved—That the Committee seek leave to sit while the House is sitting. *On division.*

Moved by Mr. McIntosh, seconded by Mr. Stefanson,

Agreed—That the subcommittee on Agenda and Procedure be comprised of the Chairman and six members to be named by him.

At 10.45 a.m., the Committee adjourned to the call of the Chair.

MONDAY, March 20, 1961.

(2)

The Standing Committee on Agriculture and Colonization met at 9.35 this day. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Brunsden, Clancy, Clermont, Dubois, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), Kindt, Knowles, Korchinski, McBain, Michaud, Milligan, Montgomery, Nasserden, Pascoe, Peters, Rapp, Regnier, Rogers, Smallwood, Southam, Stefanson, Thomas, Tucker, Webb —(29).

The Chairman announced that Messrs. Lahaye, Smallwood, Belanger, Forgie, McIntosh and Peters would act with himself as Members of the Subcommittee on Agenda and Procedure.

The Chairman instructed the Clerk to read the Minutes of the meeting of this Subcommittee. (*See this day's proceedings*).

Moved by Mr. Rogers, seconded by Mr. Stefanson,

Agreed—That the Committee print 750 copies in English and 250 copies in French of the Minutes of Proceedings and Evidence of the Committee.

The Chairman instructed the Clerk to read his Report to the Subcommittee on Agenda and Procedure regarding organizations who were asked if they wished to present briefs on farm machinery prices. (*See this day's proceedings*).

Moved by Mr. Clancy, seconded by Mr. Fane,

Agreed—That the organizations presenting briefs on farm machinery prices be instructed to send copies of their briefs at least one week before their appearance.

Moved by Mr. Boulanger, seconded by Mr. Regnier,

Agreed—That French interpreters be in attendance at all the meetings of the Committee.

A general discussion followed in regard to what information the Members of the Committee would like incorporated in the briefs to be presented by the organizations appearing before them on farm machinery prices.

At 11.10 the Committee adjourned until Friday, March 24th at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

MONDAY, March 20, 1961.

9.30 a.m.

The CHAIRMAN: Gentlemen, I see a quorum this morning. I am very pleased to have such a large turnout on a Monday morning after a heavy weekend, and on such a nice spring day. We hope that the weather will have some effect on the temperament of our meeting this morning.

First of all, to get our meeting under way, I think probably we should hear a report on our agenda and procedure. Accordingly, I now ask the Clerk of the committee to read that report at this time.

The CLERK OF THE COMMITTEE: I shall just read the things to which the committee agreed.

Agreed: that the standing committee on agriculture and colonization hold meetings on Monday, March 20th, and Friday, March 24th.

Agreed: that at the Monday meeting the members of the committee be asked to express their views on what information they expect from the organizations presenting briefs on farm machinery prices.

Agreed: that at the Friday meeting the economists from the Department of Agriculture who prepared the booklet "A summary of statistics relative to the enquiry into the price of farm machinery" be invited to attend and explain the booklet.

Agreed: that copies of the minutes of proceedings and evidence of the first two meetings be sent to all organizations which have signified their intention of presenting briefs on farm machinery prices.

Agreed: that a motion for printing 750 copies in English and 250 copies in French be placed before the committee.

The CHAIRMAN: Arising out of the minutes of the subcommittee, I shall be happy to entertain a motion for the printing of 750 copies in English and 250 copies in French of our minutes of proceedings and evidence.

Mr. ROGERS: I so move.

Mr. STEFANSON: I second the motion.

Mr. MONTGOMERY: This is not a caucus meeting. It is a regular meeting, but I do not see anybody here from the opposition. This is a standing committee.

Mr. CLANCY: Well, if they cannot get here, we cannot do anything about it.

The CHAIRMAN: We have a motion before us that we print 750 copies in English and 250 copies in French of our minutes of proceedings and evidence. All those in favour?

Motion agreed to.

Gentlemen, at the last meeting of this committee at the last session, most of you, I believe, were members of the standing committee at that time, and as I recall that last meeting, it was suggested that questionnaires be sent out by the members to various farmers in their own areas.

I know that many members took advantage of that opportunity and sent out questionnaires. You may wish to refer to the results of those questionnaires this morning, as well as to any other items which you think would be of value to the committee here.

Our thought was that the meeting this morning should be devoted to the individual members, who might wish to speak for a few minutes. And while I am on that matter, I hope you will confine your remarks to not more than five minutes. I say that because we have a 60-member committee, and if the 60 members speak only for five minutes, for example, it would mean a meeting of five hours. So I hope you will confine your remarks, and make them as brief as possible. I trust that in your remarks you will give us some indication of what you hope the committee may desire when other organizations, farm machinery companies, and so on, come before it.

It would then be the intention to have the clerk send out the proceedings of this committee to the various companies and organizations, so that they may have that material before them prior to their coming down to address us or present briefs to us. It might be helpful to them if they had the questions asked here this morning, so that when they come before you they would have the answers.

After the last meeting, at the last session, the clerk sent out a number of letters to various organizations. Therefore I shall now ask the clerk who prepared the letters to read his report into the record now so that you will know the particulars.

The COMMITTEE CLERK:

At the last meeting of the standing committee on agriculture and colonization in 1960, the clerk of the committee was instructed to write the following organizations asking them if they were interested in presenting a brief and sending representatives to appear before the committee, on farm machinery prices: Saskatchewan Farmers Union, Ontario Retail Farm Equipment Dealers Association, Interprovincial Farm Union Council, The North-West Line Elevators Association, Canadian Federation of Agriculture, Winnipeg Chamber of Commerce, Canadian Feed Manufacturers, Saskatchewan Wheat Pool, Alberta Wheat Pool, Allis-Chalmers-Rumley Ltd., Canadian Co-operative Implements Ltd., Local Custom Feed Mills, Canadian Labour Congress, Massey-Ferguson Ltd., International Harvester of Canada, John Deere Company, Cockshutt Farm Equipment Limited, United Grain Growers, Canadian Manufacturers Association, The Maritime Cooperative Services, L'Union Catholique des Cultivateurs, La Coopérative Fédérée de Québec, La Coopérative de Granby,

Of these the following are prepared to present a brief and send representatives to appear before the committee: Massey-Ferguson Ltd., Saskatchewan Farmers Union, Ontario Retail Farm Equipment Dealers, Interprovincial Farm Union Council, Canadian Federation of Agriculture, Saskatchewan Wheat Pool, Canadian Labour Congress, International Harvester Company, The Canadian Co-operative Implements Ltd., Cockshutt Farm Equipment Limited.

The following showed interest but were prepared to let their main bodies present their views: The Maritime Cooperative Services, L'Union Catholique des Cultivateurs, La Coopérative Fédérée de Québec, La Coopérative de Granby,

Canadian Manufacturers Association felt that the individual machinery companies should make their own presentations.

In addition, the Government of Saskatchewan wishes to present a brief and appear before the committee. And since this was prepared, the Alberta wheat pool signified their intention of coming.

Mr. BRUNSDEN: Mr. Chairman, we have a great deal of confidence in our steering committee. Might I suggest that we have their names read into the record at this time?

The CHAIRMAN: I shall now read into the record the names of the steering committee, so that we may have them clearly before us. The personnel of the steering committee are Messrs. Lahaye and Smallwood, the two vice-chairman, and Messrs. Boulanger, Forgie, McIntosh, and Peters, as well as the chairman.

Mr. BRUNSDEN: I think we would be employing our time more usefully if we referred these matters to the steering committee, because that is what it is for.

Mr. CLANCY: I move that if any company or organization wants to appear before this standing committee to present a brief, that it supply the members of our committee with copies of such briefs at least one week before the appearance so that we may have an opportunity to read the brief and obtain any necessary information. I suggest this course rather than taking up the time of the committee by having somebody stand and read the brief.

Mr. FANE: I second the motion.

The CHAIRMAN: You have all heard the motion? Is there any discussion?

Mr. CLANCY: I shall repeat: my motion is that if any group wishes to appear before this committee to present a brief, that every member of the standing committee be given that brief at least seven days before the appearance so that he may read it and get such information as he may need, and thereby save time.

The CHAIRMAN: It has been moved by Mr. Clancy and seconded by Mr. Fane. Is there any discussion?

Mr. HORNER (*Acadia*): Mr. Chairman, is it necessary that such briefs be filed as long as one week before the appearance? That seems to me to be a lot of time. If anybody wishes to present a brief, the chairman will have to inform him, and set a date; and then the person will have to whip in his brief very quickly.

Mr. MILLIGAN: I think the motion is a very good one. Probably a week is a little bit too long. It seems to me that the briefs we are to get from farm organizations should come first, because I think the farm organizations are only going to express our opinions. We want to know if they are in line with the thinking of the people who are engaged in agriculture. I think that the farmers themselves, who are using the machines, can offer a great deal more probably, than some of those organizations.

Now, whether briefs from those organizations are going to alter the thinking of most farm people, I think it is up to us to decide here. It would appear to me that if we do have these briefs, we should look them over first, so that when the farm machinery dealers, or the agents come here, or the companies, we would be in a better position to question those machine manufacturers a bit more intelligently.

The CHAIRMAN: Is there any further discussion?

Mr. KORCHINSKI: Mr. Chairman, suppose some organization did not present a brief at this time. Would it be able to appear before the committee later on?

The CHAIRMAN: I do not think there should be a hard and fast rule. You are asking these organizations, if possible, to have their briefs in the hands of the member of the committee, as has been suggested, a week before they appear, or probably as soon as possible. I would suggest we might perhaps put a minimum of three days on it; that might be more appropriate. I wonder if Mr. Clancy would amend his motion to the effect that the briefs should be presented at least three days before the appearance.

Mr. THOMAS: Mr. Chairman, I would like to support the motion that the period be at least a week. I do not think that is too long a period in which to have these briefs in our hand before they are heard. I would be glad to support the motion that if possible we have the briefs a week ahead of time.

The CHAIRMAN: I might say that these companies all have been notified. In January they were advised to have them ready. I think they have had ample time to prepare the briefs. Actually they were notified last August and then were re-notified.

Mr. PETERS: There is a great deal of merit in the motion, but I would not like to see it made compulsory. I do not think it should mean that they could not appear unless they had presented their briefs a week ahead of time. Some of them might have extensive briefs from which we would get a great deal; on the other hand, others may have very small, informal briefs. I am thinking of some of the farm organizations which would appear, and it would be mostly a matter of speaking to the farmers, as Mr. Milligan said. I would not like to see a ruling that if they do not send in their briefs ahead of time they cannot appear. This would not be in keeping with the normal procedure in other committees. Although I do think there is some good reason for supporting the motion, I would not like to see it have the effect of some organizations not having the opportunity to appear.

Mr. CLANCY: My opinion simply is this: if this committee is going to be of any value, it is hardly worth having people appear at all who have not given enough thought to put in a brief seven days ahead of time. We can always sit on coffee row and speak to them.

Mr. FANE: I agree 100 per cent.

Mr. THOMAS: Does this motion shut out any organization which does not have its brief in our hands seven days ahead of time?

The CHAIRMAN: Some organizations may not wish to prepare a brief at all. They may wish to appear merely to have a general discussion. Are we going to exclude them?

Mr. CLANCY: I did not suggest that anyone be excluded. Personally I do not feel that I would get much out of it if I sat and listened to somebody read a brief. I am a little slow, and I like to think it over.

Mr. ROGERS: There is nothing wrong with the motion, but we do not wish to exclude anyone.

Mr. CLANCY: There is nothing in the motion which would exclude anyone.

Mr. HORNER (*Acadia*): Would you read the motion again?

The CHAIRMAN: I will ask the clerk to read the motion.

The COMMITTEE CLERK: Moved by Mr. Clancy, seconded by Mr. Fane, that the organizations presenting briefs before this committee be asked to present them at least one week in advance.

The CHAIRMAN: Are we ready for the question?

Motion agreed to.

Mr. MILLIGAN: I would like to move that the briefs from the farm organizations be heard first, before the companies.

The CHAIRMAN: This morning it was suggested this matter be left to the steering committee and that the steering committee would decide the order in which the presentations would be made.

Mr. FORBES: Last year at some of our meetings we discussed the preliminaries. I have made a note of some suggestions which I would like to make at this time.

The purpose of this inquiry is to determine, if possible, why the costs of farm machinery have increased approximately 100 per cent during the last ten years, while farm income has decreased during the same period. The operating costs on an average sized Manitoba farm have gone up to \$15,238.00 annually, from \$4,800 about 15 years ago. According to a farm management survey conducted by the University of Manitoba, of every \$1.13 a farmer receives he needs \$1 to pay expenses, and therefore he only earns 13 cents. On an examination of this report we find that farm machinery is the largest item of expense.

Among the questions the committee should expect to have answered are the following: are the manufacturers' profits too high? What percentage of the cost of machinery goes to labour? What percentage of the cost of machinery goes to freight? What is the amount of commission paid to agents? Are there too many distributors? Why do costs continue to rise for equipment and parts—and I emphasize "parts". What is the mark-up on parts? Would standardization of equipment lower prices? What kind of an agreement do the machine companies have with their agents?

For the information of the committee I endeavoured to obtain some of this information. I do not want to divulge the source of my information, but I will read a few extracts. Among the things I asked was the following: "Some machine agents have indicated to me they have to pay for stocks of parts themselves and that the manufacturers will not give them credit for parts that become obsolete. Is it your opinion that there are unfair trade practices between the agents and the manufacturers?" The answer I got back is this:

Dealer purchase agreements with manufacturers do vary somewhat in respect to purchase of new machine units, and as a rule some sort of floor plan does exist to allow a dealer to carry sample models of machines. Repair parts, however, are usually on a 30-day basis and the dealer is required to invest quite a sizeable amount of money in parts.

It goes on to say that under certain circumstances a dealer can get extra discounts, and in some cases extended terms. Then there is this:

The problem of obsolete parts will have to be solved by more efficient means of stock control on the part of the dealer and the supplier.

There is another thing which concerns us regarding prices of farm machinery. I pick up the paper dated June 20, 1960, and see this:

Philadelphia—Allis-Chalmers Manufacturing Co. Tuesday pleaded guilty to federal charges of price-fixing and bid-rigging in the sale of heavy electrical equipment. Twelve other companies indicated with Allis-Chalmers pleaded innocent.

Then the article goes on and gives more details. Most of the members of this committee know that the electrical firms enter into this matter in respect of such pieces of equipment as starters and ignition systems. This involves such companies as Westinghouse and Delco. Some of the parts come in from the United States. Does the combine in the United States affect prices in Canada?

There is another article headed "Executives get Jail Terms in Electrical Anti-Trust Suit". The article goes on to state that there actually was a combine. Does that situation exist in Canada? I would expect the machinery companies to indicate to us that they have no part in this combine in establishing prices on machinery.

One is tempted to be suspicious of any prices of such companies as Massey-Harris, Cockshutt or Allis-Chalmers. You will find their prices are very closely related. I think this is one of the things on which the companies should give us some answers.

I have made a considerable study of the last machinery inquiry which was conducted in this house in 1937. It consisted merely of a lot of statistical figures and there was no conclusion as to what was causing the increase in the prices of machinery. I do not know whether or not the fact that there was an inquiry had anything to do with maintaining the prices at that level at that time.

I am hoping that this inquiry will bring out some definite conclusions as to why the cost of machinery is so high.

Mr. FANE: I would like to string along with everything Mr. Forbes has said. I think he has made a very good start in explaining our feelings in respect of this inquiry.

On the top of the notice which we received for this meeting it states that we are to give our views on what we expect from the organizations presenting briefs. In order to get anywhere in this matter I think we must conduct the inquiry from every angle. We have to find out the cost of the machinery at the very start and then determine why it is so high. We must also determine why it costs so much to get steel. Of course we all know that, but we do not have figures on it. We must know about freight rates, labour, and the importation of various parts which are not made in this country. We have to know about spare parts. We must also know about the cost of distribution. The cost of distribution is a factor which the farmer thinks goes a long way towards making the prices so high. Shall we suggest to these companies that they make one standard model and do not change it every year? Shall they all make a standard model and have the equipment more or less interchangeable? I know it will not help the machine companies too much, but we will not worry about that, so long as we help the farmer. The cost of repairs is something which seems to be entirely beyond reason. The distributor gets a very high commission on these things. Of course, if all the facts are known, perhaps he is entitled to it; perhaps he is not; he may get more than he should.

We must go through all these items. This must be gone through right from the start to the finish. Unless we do that we cannot find out what the score is and cannot come to any conclusion.

Thank you.

Mr. THOMAS: Mr. Chairman, I would like to back up the former speakers. I hope that this committee can make a real contribution not only to the farmers of Canada but also to the people in general. Like the cost of our other commodities, the cost of farm machinery should be divided under three heads, namely, the material content, the labour content and the capital cost. As a result of the efforts of this committee, I am hoping that these three costs—and, again I repeat—namely, the material cost, the labour cost and the capital cost, can be traced right through from their source to the finished product. I would start with the ore coming out of the mine and I would carry it through to the finished product, as far as the material cost is concerned. In relation to the labour cost, I would follow it in the same way, from the very source of the mine right through all the different phases to the finished product. As far as the capital cost is concerned, I think it would contain such things as commission, and wall of the other items of overhead—return on investment, depreciation and those other things which must come under the heading of capital cost.

To repeat, I would like to see those things carried from the source right through to the finished product.

The CHAIRMAN: You are next, Mr. Southam.

Mr. SOUTHAM: Mr. Chairman, last July our government put wheels in motion to establish this inquiry in connection with the price of farm machinery, and immediately there was a widespread interest among our farm population across Canada, and, I think, indirectly among other people affected by the

economic welfare of farmers. We have approximately 1,800,000 of them in Canada and, as Mr. Forbes, Mr. Fane and Mr. Thomas have outlined, we are all vitally interested in the fact that we do not want to see this inquiry become abortive, as the one in 1937 did.

I think we should explore every means in order to have a sensible inquiry, and that we should come up with some concrete conclusions to alleviate the present situation.

In speaking to this matter last year in this committee, I suggested that possibly other countries, like Great Britain, the Scandinavian countries, New Zealand, Australia and the United States, must be facing a similar problem in the industry and, as it is possible that they may have made some inquiries along the same lines as we are undertaking, I was wondering if any of this information which they have brought forward has been tabulated. If so, I think it would be advisable for our committee to secure that information and, by having access to it in our deliberations in this committee, it would prove very beneficial to us.

Those are the thoughts that I would like to interject into the discussion this morning.

The CHAIRMAN: Mr. Southam, it is possible that the economists who are going to be heard on Friday next will be in possession of some of that information.

Mr. SOUTHAM: But if they are not, I hope that we will be in a position to send a request for this information to the secretaries of agriculture in the United States and these other countries, if it is available to us. I feel they would have done a great deal of work which we now are undertaking, and it would be a great deal of assistance to us if any information they have was included in our study.

The CHAIRMAN: Have you a statement to make, Mr. Peters?

Mr. PETERS: Mr. Chairman, in looking at some of the developments that have resulted from previous investigations, we probably cannot be too hopeful of the outcome of this inquiry. After discussing these matters during our forthcoming meetings, and studying them at great length, I think we will come to somewhat the same conclusion that the price spreads committee came to, namely that the villain in the whole matter is the consumer himself. It is my opinion that if people would not buy high-priced machinery, it would not be so high. The conclusion they came to at that time was not quite as simple as that but, in effect, it boils down to just that.

I think one conclusion that members of this committee would like to arrive at is that certain standardization should take place. In this regard I am referring to such things as modifications which are made. One of the members mentioned last year that he had paid a great deal for a combine and, engineering-wise, it was not soundly constructed. It was not a good machine. There was an expensive modification on it, but it turned out that it was not a sound one.

We may find that we should make certain recommendations, among them, standardization. We probably will look at the results of other committees which have met in advance—and I am thinking of our defence expenditures committee—where we decided we were going to standardize our arms. However, many years have gone by and we have not been able to do so. Although defence expenditures is a matter over which the government has control, they have not such control in this case. In delving into the facts, I think we will come up with the conclusion that labour is going to be a very small part of the cost of farm equipment. I heard some of the members laughing when I made that remark. However, I will be very surprised if I am wrong in that regard.

Automation has taken place in that field in the same way as it has in others. It is true that wages have gone up. Another problem is that of transportation.

I think that some of the members have hit on a much better reason as to why there is a terrific price involved in the maintenance of farm machinery, and that is in connection with this parts business. We all know—at least in my part of the country—that if you want parts, you go to your local agent and he, in most cases, cannot carry sufficient parts to service all the equipment that he sells. As a result he has to send to a distribution centre, and either pay cash for his parts, or buy them on a short-term credit basis. By the time these parts are held in storage, the express charges and other things taken into consideration, the parts become much too expensive. It is my hope that we can do something in this field.

Mr. Chairman, it is my opinion that we are going to be faced with the same problem with which other committees have been faced. I am thinking particularly of the royal commission on price spreads, and I think we will find out that it boils down to the simple fact—and this is the fact the farmers are not willing to face, and won't face—that the farmer himself wants to buy new equipment, the same as his neighbour does, and thereby keep up with the Joneses. I do not think we are giving enough consideration to the demand for a design of basic farm machinery. It is my feeling that perhaps there are too many frills on farm equipment.

Another thing that I think this committee could do is to investigate this charge or statement which is being made generally by agriculturists, particularly agricultural representatives and those people who are in that particular field, in that field of endeavour where utilization of machinery is made either through co-operatives on a township basis, or even through smaller units, when the fact is that we probably could get away with much less machinery than is being used to produce the same type of production.

Mr. Chairman, I think those are the things that we could go into in a general way. I hope that we can come up with some solution to this price problem. However, I think we are going to meet the same difficulties which the royal commission on price spreads met.

The CHAIRMAN: Have you something to say, Mr. Horner?

Mr. HORNER (*Acadia*): Mr. Chairman, I have no intention of pre-judging the efforts and the conclusions to which this committee will come.

At this time I would like to agree with the remarks made by some of the other members as to what they would like to see the machinery companies present in their briefs.

There is one point which has been overlooked, and it is this. I would like to have the machine companies explain in detail the testing of their machines. We all have seen the pictures of Massey-Harris combines rocking and rolling over a rocky piece of road, and they are proclaimed to have been tested thoroughly. I might say that I have purchased a great deal of machines in my time. There is one piece of equipment in particular of which I can think, and I was so annoyed that I was on the verge of writing the president of the company about it. I think there are many machines put on the market which have not been tested thoroughly and, because of this, on a number of occasions farmers have to call out the local blacksmith or wheel out their own welder and make the repairs themselves. It is my hope that the machinery companies will deal with this point in detail.

Another point that I think has been overlooked is that machine companies in Canada have been charging all the market will bear. I have heard block men of the machine companies state that the same combine made in the United States sells for less money in Germany than it does in Canada. It is identically the same combine but, because the competition in Europe is of a different nature, they lower their price there and make it up on the

western farmer here. I do not like to suggest that this is going on, Mr. Chairman, but I hope that the machine companies, in coming before this committee, will deal with this point and endeavour to prove that they are not charging all the market will bear. Also, I would like information from them as to the price of their combine made in the United States and sold in Europe as compared with the price at which it is sold here in Canada.

The CHAIRMAN: Mr. Kindt is next.

Mr. KINDT: Mr. Chairman, I should like to make a few observations in connection with some of the things which I think this committee should examine, and thereby lay a foundation for later action to be taken.

For example, in the field of production—and after all, what we are dealing with here is production of farm machinery and related problems—as one other member has mentioned, there ought to be a searching investigation into the labour costs, the material costs, the capital costs and management costs. In other words, there are those four factors of production. I think that we should go into each one of those factors and break it down in order to show the build-up or the percentage contribution of each of those to the final cost. In other words, instead of having all this big talk about the price of labour and that sort of thing, which is based on bias, what we are endeavouring to turn up in our study is facts, and the proper relation of those facts, in order to show what the problem is with respect to the farmer who is so oppressed in western Canada because of the price of the farm machinery. I had hoped that the cost breakdown would be brought together by economists who have been working on it since last summer. As yet, I haven't had an opportunity to examine the material which they have brought together. However, it was my thought, when this matter was first discussed—and I made the original suggestion—that a study should be made of these labour, material, capital and management costs, and to have that statistical material properly coordinated, analyzed and, may I say, interpreted, before this committee met and the witnesses appeared before it.

In connection with the distribution side, which, in turn, has to do with marketing. May I say that marketing of farm machinery is a big problem. There are tremendous costs involved, due to competition between companies. It is my feeling that we should examine the spreads in the field of marketing, and that we should take into consideration trade-in values. In other words, we should take into consideration each step, namely transportation, retailing, financing and all those factors in the field of distribution and marketing. In all of those factors in the field of distribution and marketing we should make a thorough examination into the relative proportion of each factor in the complete cost, as well as the relative cost of each in relation to the final cost of the machine to the ultimate consumer.

There are two or three other points which I should like to make, one being that I wish to have some attention given by this committee to new inventions. Last fall, a gentleman from Ontario who was the inventor of the Bren gun, approached Mr. Hayden Stanton, and Mr. Stanton brought him over to my room where we sat down and talked for some time about an invention this man had worked on. In essence, it is a farm tractor, the wheels of which are driven by hydraulics and, instead of the conventional type of motor, this man used a little motor. He claimed that his tractor could be placed on the market at around \$1,500 to \$2,000 and, at the same time, it would have a drawbar power strength greater than the big diesels now in use. I do not know if this inventor has something worth while but it was Mr. Stanton's thought, and I hope it will be followed through by the committee so that this man may appear before the committee to explain his invention.

This gentleman, I should add, is not a fly-by-night. As I have said, he was the man who developed the Bren gun, and I understand he has a factory which employs some 60 people. Therefore, he is not a fly-by-night; he is not someone who has come along with something that could be passed off with a shrug of the shoulders. He is a man who has got something on the ball, and I believe he could contribute much to the work of this committee. This man, and others like him who may be able to point the way to existing machinery companies, could help us in our deliberations—and I say “point the way” because I feel that sometimes new inventions become submerged because certain people who have a throttlehold on the manufacture of farm machinery are inclined to keep them submerged and prevent them, so to speak, from coming to the surface. What I wish to emphasize is that people who may have new inventions should be given an opportunity of appearing before the committee and explaining their inventions.

I think one other important point is that when we bring these things together and analyze them, we should strive to clarify and correct the problem. For what reason are we making this survey? We are making it in order to help the farmers of western Canada—

Some Hon. MEMBERS: All of Canada.

Mr. KINDT: Pardon me, I stand corrected. We want to pinpoint where the problem is and clarify what action should be taken to solve it. If there has to be legislation, fine and dandy, and if it is necessary for a correction to be made by the machine companies themselves, we hope that by airing it before this committee they, having read the deliberations or having appeared before the committee and listened to our proceedings, will of themselves see the handwriting on the wall and make changes before legislation or other things are necessary. I would say, Mr. Chairman, a great deal of the good things which we hope will result from our deliberations will, in effect, be what the manufacturers themselves see are inevitable and I hope that, in the ultimate analysis, the farmer will get the benefit.

There is one final point I should like to make, and it is that in our statistics we include what is the net position of agricultural machinery with respect to the United States. In other words, we know that there is no tariff on farm machinery coming into Canada, and I understand that certain machines which are made in Canada are shipped to the United States and sold there. Conversely, we all know that a great many farm machines manufactured in the United States are imported into Canada and sold here. What I should like to ascertain is the net position in dollars with respect to the flow of those machines back and forth across the line. If I had those over-all figures, I would be able to relate them to the unfavourable trade balance which we have with the United States and see how much of that balance is attributable to the movement of farm machinery. If we are to attack this problem realistically we have got to know these things, we have got to dig into them, and I would have hoped that the economic committee working on these figures during the past year would have been able to delve into the records of the department of commerce, have that material analyzed and present it for the benefit of the committee.

I must say, Mr. Chairman, that what I have said has been just off-the-cuff. I have not made copious notes and, therefore, I agree with the member from Medicine Hat who has said that the guidance for this committee and the guidance for the machine companies who will be bringing in their briefs, should come from the steering committee and the material which it prepares, rather than from off-the-cuff statements that might be made at meetings of the committee. I also feel that anything we have said or accomplished this morning

should be supplemented by work and detailed digging on the part of the steering committee. I think the steering committee should consider the off-the-cuff remarks which the member for Dauphin made in his excellent speech, and I believe that is what the committee wants. We shall have to dig deeply in order to come up with the answers which the farmers from western Canada expect.

Mr. WEBB: Mr. Chairman, I do not remember that we had representatives from the actual dealers, the agents who sell this machinery, at previous meetings. If these men were brought here I think they would give us some very interesting and revealing facts. I do not believe that those of us who go around the country find many prosperous farm machinery dealers. Ontario is the only place I can speak of with authority, and there not long ago the machine companies were setting up dealers almost door to door. They insisted that each dealer should have big showrooms, carry thousands and thousands of dollars worth of stock, and always have so many machines on display. The result was that almost daily dealers were going out of business or going into bankruptcy and, when they went into bankruptcy, there was no way of getting back the money which was invested in their showrooms. The manufacturing companies had to add that to their liabilities and it increased the cost of farm machines which they produced in the following years. If my suggestion is adopted, I believe we shall find out it is not always the agent who is making money on farm machinery.

Mr. BOULANGER: Mr. Chairman, I should like to ask you if it would be possible to have an interpreter attend during the sittings of this committee?

The CHAIRMAN: I shall have to refer that to the clerk. He knows that sometimes there are difficulties involved in having interpreters present. I may now say that it is in the hands of the committee whether they wish to have interpreters present. If the committee decide on that we shall try and make the necessary arrangements.

Mr. HORNER (*Acadia*): I think we should have an interpreter at committee meetings. Many committees seem to arrange this.

Mr. REGNIER: I should like to support Mr. Boulanger. It is very difficult for some French-speaking members to attend and understand what is taking place. It is very difficult for them to take part in discussions unless they can speak in their own language.

The CHAIRMAN: All I can say to Mr. Regnier is that we shall see what we can arrange.

Mr. REGNIER: Perhaps members of the committee who can speak both languages could act as interpreters, in the absence of an official interpreter.

Mr. SOUTHAM: I should like to support what these gentlemen have said. I think this is a very widespread problem. There are a lot of cases where an interpreter would not be necessary but, in a full scale investigation like this, I think it is only fair that one should be in attendance.

Mr. REGNIER: I think the absence of many Quebec members can be explained by the fact that they cannot take their full part in discussions.

Mr. BOULANGER: I should like to thank very much those members who supported my idea. I have just a few words to say this morning. I shall try to do my best but must ask your indulgence.

The CHAIRMAN: Take your time, Mr. Boulanger. We shall bear with you.

Mr. BOULANGER: What I wish to say is that members of the opposition are glad to see the government making a study of the prices of farm machinery and we shall do our best to cooperate with the committee. We hope that the recommendations which will be made when the committee has finished its deliberations will prove of valuable interest to the farmers of the country,

and we also hope that the government will take whatever action is necessary, by legislation, to implement whatever recommendation is made to help farmers who are squeezed between the cost of the services and machines which they use and the prices which they obtain for their farm products.

The farmers, as a whole, are in a very bad situation, and I believe many things could be done to help them. It is premature to say that these things are but we hope it will be possible to make good recommendations when we have finished our study. I also hope during the course of our study members will keep in mind that, in addition to dealing with prices of machinery on the western prairies, as suggested by the member for Medicine Hat, we are also dealing with prices in eastern Canada. I am glad he corrected his statement and, as I have said, we shall do our utmost to cooperate with the committee.

Mr. REGNIER: I just want to touch on one point raised by Mr. Peters, who referred to delay in obtaining parts. This delay, I believe, plays a great part in the ultimate cost to the farmer. Not only does he have to make a trip to a city, and sometimes many trips, to get the part he requires, but there is the cost of the delay itself to be taken into consideration when a machine cannot be operated because a part is missing. I think the committee should study thoroughly this very frustrating and expensive matter of not being able to secure parts whenever they are required.

Mr. NASSERDEN: Mr. Chairman, one of the points we should face is the cost of the reconversion of plans to promote new models, and also to see some encouragement given to the interchangeable parts on the machines. Like some of the other members, I would like to see the effect of labour costs on the wholesale price of farm machinery established. I emphasize wholesale price, not retail price, because there is a difference between some of the companies, I believe. I would also like to have the companies establish the effect of freight costs and set them out in relation to wholesale machine costs to their dealers. I would also like to see the cost of the patent rights on component parts set out in comparison to wholesale machinery prices, and the costs of patent rights on machines and motors used in particular units.

Also I would have the companies set out the extent of the sales outside the recognized name or dealership organization of an individual company. Sometimes they sell a motor to another company to put in a tractor combine. We should be able to make the comparison in relation to the wholesale price of that machine.

Mr. PASCOE: Mr. Chairman, I think that most points regarding this inquiry have been brought out sufficiently and that there should be no need to repeat them, but I want to emphasize again the need for a full inquiry into this problem, and some very definite findings and recommendations. That is a definite obligation that we owe to our constituents after starting this inquiry, and I am sorry to hear some people express the opinion that we are not going to accomplish very much. I do not think we should start out with this attitude. There is certainly a great interest among the farmers. I will not take up too much time but, during the inquiry last session I, and other members, sent out two questionnaires to various farmers to indicate their thinking on this matter. I might read out some of the returns.

The second question was "please list what you consider to be the most important factors contributing to the increase of farm machinery prices." The answer was, from a farmer, first wages and freight rates, and, second, profit for the manufacturing companies, high cost of labour, and too many changes in designs.

These are all practical farmers, and I know them. Another one stated the factors to be excessive profit of the manufacturers, labour, high freight rates, and high duty on imports, while another stated them to be labour in

manufacturing, government tax, and price spread in comparison to what one bushel of wheat will purchase.

Now, Mr. Chairman, to indicate what farmers are thinking in regard to this, other members of the committee have referred to the fact that we should have individual dealers here. I think we should have individual practical farmers here to express their opinions. I think it should be brought out more clearly that this is a public inquiry and we should have as many people come here as possible. We should make an attempt to have meetings in big rooms and to have as many out here as possible. I notice there are not too many people from the press, and yet the press should be interested in this.

MR. KNOWLES: Mr. Chairman, as Mr. Pascoe has said, this subject is pretty well covered, but there are two points that I would like to back up because I think they were referred to the steering committee. The one was made by Mr. Mulligan. It is important that we hear the farm organizations, and I would like to have their point of view.

Another point that was raised was that if there had been inquiries carried on in the United States, Australia and other countries, the steering committee might find that out immediately; because if there is some valuable information for members, we would know the pitfalls and some of the things that we should avoid, and some of the things we should like to ask.

Those are the two points I would like to mention. I might say we, in eastern Canada, are interested also because many of my farmers are very diversified, and you will find that we have a full line of machinery for many purposes. People in fruit farming are probably in corn growing and in the haying business, and they have a full line of implements, including the combine. There is great duplication, and if any people need help, it is we in the east who need it just as much as the west. I know we should not be controversial, but I would like to stress that this is pretty important for all farmers in Canada.

MR. RAPP: Mr. Chairman, I am not going to repeat what has been said here regarding the importance of this meeting, but when I was home during the recess I was presented with a financial statement of the C.C.I.L. and I noticed with satisfaction that this cooperative company will appear and present a brief to this committee. My attention was directed to the fact that the C.C.I.L. has been in operation less than 10 years, and during this time they have done business to a value of approximately \$54 million. They were able to pay out dividends of somewhere around 11 per cent, or \$5,600,000, to their members. This 11 per cent was paid on top of what the company had actually paid in expenses. For instance, they have incurred losses of approximately 16 per cent in trade-ins. You are familiar with this trade-in business. On top of that they had allowed a discount to their members of approximately 13 per cent on bought machinery, when they paid cash for it. During this time they were still able to pay approximately 11 per cent on their purchases.

I would like to direct the attention of the committee to the fact that when this particular company appears as a witness, with a brief, we should not fail to ask questions because I think it is very interesting for us, when the Massey-Harris Company and this cooperative enterprise both appear here, to find out what is the actual difference between these two companies. One is able to allow its customers or members a big 13 per cent discount, after having incurred a loss of 16 per cent in their trade-ins, and still they were able to pay back such a high dividend.

That is all I wanted to say at the present time because I am sure all the rest of the members will wish to speak on other matters, and I concur with their views.

Mr. MILLIGAN: Mr. Chairman, I would like to endorse all that has been said and enlarge on what Mr. Webb said on dealer problems. The dealers are important members and it would be helpful to see some of these people. It might place them in an awkward position because of their situation, but we could hear them for the direction of the committee, sitting in camera. There are successful dealers in Ottawa who could give us general information on the problems they are faced with, when we are questioning some of the firms.

Mr. SMALLWOOD: I would like to mention that in western Canada we have a retail dealers association. We could contact those associations. There is one suggestion on bringing in practical farmers, but it seems to me, when I look around and see Mr. Knowles, Mr. Milligan, Mr. Horner, Mr. Rapp, Mr. Peters, Mr. Henderson and myself, that we are all practical farmers. This suggestion is more of an insult to this committee than anything else.

Mr. KINDT: By the way, I live on my farm also and I am a practical farmer. We raise more than 10,000 bushels of wheat every year. Now, in so far as being practical is concerned, I did not say that you were not practical, nor any other member of this committee when it comes to farming. But from a psychological point of view and its effect upon other farmers and their participation in the work of this committee, there should be representatives of good outstanding farmers brought in to give evidence to start the ball rolling in this committee. It would be straight from the horse's mouth, when we hear what the farmers think in this country about the price of machinery.

You cannot tell me that the press and those who write about this would not like to hear, first of all, not from members of parliament—because we are here to cross-examine,—but from people who are out there in the field, facing these costs of machinery problems. It is they we are working for. They are the bosses; we are the hired men, and we should bring them in here to tell us what their problems are and what their costs are with respect to machinery.

The point that the hon. member has brought up does not seem to be pertinent whatever. It is a fact that we are all farmers, myself included, but I do not feel that speaking here as a member of parliament is the same, in so far as the farmers of all of western Canada are concerned. We ought to bring in some of those people because, psychologically and with respect to good public relations, it is a thing that should be done.

Mr. HENDERSON: After that stirring speech, there is not much use in my saying this, but at home the tractors, to start with, are priced too high, and the boys who work them have to have a new one the next year. The patterns change and electric lighting is put on. Let me tell you about Firestone tires. I was in California and Nick Durman, who used to farm in the Peace River—I was standing outside one night when he came home, jumped out of the car and said "We have done it". I asked him "What have you done?" He said "We've struck". I said, "Why did you strike?" "We found out that Harvey Firestone made \$20 million last year, and we are going to get a piece of it." So I went home to bring this big Firestone tractor tire, and I guess they went out on strike. A farmer finds that when he has worked a tractor for a long time he gets tired of it and fed up with it. He does not think it is as good as that of the Jones, and he trades it in. All of us know that if one goes to any of the machine yards he finds that they are full of trade-ins. Those trade-ins all cost the farmer money. I know a couple of these machine guys who have made fortunes. There was one fellow I went to California with. He was in the Case business and made a fortune. Every farmer had a Case. He was one of the very fortunate people.

I am a farmer and have been farming for 50 years. We are big farmers. My boy is home now. He went to the southern states to see how they are growing cotton and different things like that. These young fellows get ideas into their

heads. He went down there and they showed him all over the place. When he came home he said, "This is the place for me, right in the Peace River country, the best farming place that God ever created."

Mr. CLERMONT: Being a new member here, I do not know the procedure, so I will ask a question and I will be told if I am wrong or right. I listened to the list of the manufacturers who are supposed to present briefs here and I did not notice that there is any for, say, dairy equipment or stable equipment. I have heard mention of combines, tractors and so on. For the eastern parts, and especially for Quebec, it is very important that the cost of stable equipment and dairy equipment should be considered. I do not know if the committee is empowered to look over that, but I think it is very important. Looking last week over the latest dominion statistics for Quebec, I see that it is one particular province that in 1960, according to the preliminary figures they have, will have about \$1 million less in income. I think it is the duty of this committee to look at the question of stable and dairy equipment.

Mr. HORNER (*Acadia*): I would like to say something about the bringing down of machine dealers. I think it would be a good idea. If we could get a representative of the machine dealers' association, either from one of the western provinces or from an eastern county, it would be helpful to the committee. Such a representative could explain the purchasing of parts, the amount that they have to keep on hand, whether the company reimburses the money, and so on. All this could be helpful.

With regard to the question of bringing in farmers, I think the main duty of the committee will be in cross-examining companies. The only real advantage of bringing in farmers would be to find out their views as to why the machine costs are so high. Practically every member who has spoken here has spoken on the question of machine costs and what he would like to see done in this regard. I think that practically every possible field is covered.

We should be proud, as a committee, that most of the members here are practical farmers and will certainly be capable of carrying on the cross-examination as to what the causes are for the costs of farm machinery. I see no real advantage in bringing in farmers to be interviewed by the committee. If this necessary, surely we can find a farmer already here and so spare the government the cost of bringing them into town.

The CHAIRMAN: Might I enlarge on that? As I look around over this committee, I see that practically every member attending the committee is actively engaged in farming. No doubt the other members who happen to be absent this morning are also engaged in farming. It is a pretty large committee and the number of practical farmers seems to be pretty well 100 per cent.

Mr. HENDERSON: Mr. Chairman, when you see a swather on a western farm, it has an engine on it. It used to be a swather with a pole, just like a binder. Now it has got to have an engine.

An hon. MEMBER: And self-propelled, too.

Mr. KINDT: I would like to see this committee kicked off as a committee to make an examination of the problems down at the grass roots. My thought in making my views known is to give that "grass roots" touch to the work of this committee. Some members seem to be confusing the fact that they are farmers and can talk for farmers. Sure, but we are cross-examining, and I think that if you had some good practical farmers brought in here, it would be valuable. Then this committee would not be something superficial or something up in the clouds, from which nothing would come.

We should start the work of this committee with a good examination and some talk and some public discussion and newspaper publicity. We should have actual bona fide farmers from four or five places across Canada. That would

create the feeling that this committee actually is coming to grips with the problem of the grass root farmers. If we look around we see that we have not got the proper perspective of public relations as to the way this committee should be discussing these problems.

Mr. SMALLWOOD: I never heard anything so ridiculous in my life. We have grass root farmers here. We may not be members of the wheat board, but we have grass root farmers, and they will be able to cross-examine those who come. I could pick them out on this committee.

Mr. MILLIGAN: I think we are going to spend a lot of time with farm organizations and farming groups. Surely they are the people who will formulate briefs and who will be expressing their opinions. I think it is the duty of members of parliament to ask questions when we meet these people. If we want any further information, members can get it from the farmers in their own areas. We can contact them and ask what we want to ask. It seems to me that we should not spend too long on the presentations from the farming organizations, because they will be of a general run, right through. If we spend too much time on the briefs, we may not get at the problem. It is really the farm machinery manufacturers we want to hear here.

The CHAIRMAN: Mr. Milligan, I hesitated to stop you in the earlier proceedings of this committee, when you submitted your resolution that farm organizations appear before the committee first. At this time we might go into that matter in a little more detail, as to who, in your opinion, should appear before this committee in the earlier stages.

Mr. FORBES: I wish to mention the point raised by Mr. Henderson, about farmers trying to keep up with the Joneses by buying new tractors. We know that the implement yards are full of used tractors. That is all true, but there is the cost of overhauling and repairing those tractors. Those costs are so high that it is more economical to trade the thing in than to try to fix it.

The CHAIRMAN: Mr. Milligan, would you care to elaborate any further on your suggestion?

Mr. MILLIGAN: In putting forward that motion, it seemed to me very important that we should hear from the farm organizations first. Their opinions would be of a general nature. From their briefs we might get some idea as to what those groups are thinking. That would help us in questioning the machinery dealers when they appear.

An hon. MEMBER: It seems to me that when we receive these briefs they are not going to be of much help. From my experience in being on farm organizations, I think that the information which the farm organizations will submit will be in general terms. I think we should hear them first.

Mr. RAPP: In the past, all of these committees were held along the same pattern as we have it here. Briefs were presented from those organizations with different views. As far as I am concerned personally, I created some interest when I suggested here one day that we should hear one side of the story one day and the other side of the story on another day. Those views were all of interest, and we were more or less broadening our own views on these things; so I am not exactly opposed to what Mr. Milligan said. I think the pattern which we had in the past here, so far as these organizations were concerned, under which they were invited here to present their views, was a good one. I think it was really educational and interesting in this way.

The CHAIRMAN: Members of the committee, I am just asking for suggestions at this time that might be helpful to your steering committee.

Mr. NASSERDEN: My thought is that the dealers association could have their officials present their views as an association. It might be good to have some individual dealers as well, if they are willing to come and appear. We could

have it on a voluntary basis. Some of them would not want to appear, regardless of whether they were invited or not. However, some of them might care to do so, because some of them feel that there are certain practices in the industry today that are not in their interests or in the interests of those who are using farm implements. Those people should have the opportunity to appear. That opportunity should be made known by way of advertising in the newspapers across the country, that this inquiry is open to them if they feel that they wish to come down. I do not think that it can be restricted to any particular time. It might be made known that they could come whenever it would be convenient for them. I know, from talking to dealers in my constituency, that they are not all satisfied with the agreements that they have with the companies. Most of them would hesitate to come out to an inquiry like this and say so, but there are a few of them who would take a chance on it.

Mr. HORNER (*Acadia*): Take a dealer who has just gone bankrupt—he would do it.

The CHAIRMAN: The retail farm dealers have indicated that they will appear before the committee. Their membership is pretty large in the province of Ontario. I am pretty sure there are other equipment dealers organizations that might wish to appear before us. I may say that the committee can summon anyone to appear. In the case of the Ontario organization, their president and vice-president, who are likely to be here before us, are equipment dealers themselves. They can be cross-examined on their own operations.

Mr. PASCOE: I want to see how much power this committee has. You say, Mr. Chairman, that this committee can summon witnesses. Can we ask for their records? Have we the power?

Mr. FORBES: Sure, read the terms of reference.

The CHAIRMAN: I just would not like to answer that question directly at the present time.

Mr. PASCOE: I think we should clarify that point at some time.

Mr. FORBES: I think that the terms of reference of the committee authorize the calling for papers and persons to give evidence.

The CHAIRMAN: Offhand, I would say that we had the power.

Mr. HENDERSON: That was in a broadcast I made this morning.

Mr. SOUTHAM: Mr. Chairman, this may be a little apart from the discussion. I was interested in a remark made by Mr. Clermont, the new member here, with respect to the dairy industry. We have heard a lot of reference to questions about combines, tractors and so on, but the dairy industry is a very important one to all of us. I just wonder if invitations have been sent to dairy equipment people such as Beatty Brothers and deLaval, who deal more or less exclusively in dairy implements. They are representative firms of long standing and I think we should send them an invitation to present a brief. It would be a very important matter for the dairy industry.

The CHAIRMAN: I will accept that if someone would suggest the names.

Mr. CLERMONT: The two names which were mentioned a moment ago are those of firms in eastern Canada.

Mr. SOUTHAM: They were deLaval and Beatty.

Mr. CLERMONT: I think Beatty is from Fergus and deLaval is from Peterborough.

The CHAIRMAN: There was mention of bringing in some dealer in stable equipment.

Mr. PASCOE: There is Beatty, and there must be others. This committee could make inquiries and see who could be invited to give evidence. There is Beatty and there is a firm named Jutras in Victoriaville, Quebec.

Mr. MILLIGAN: On reading over the names of the different people who are to present briefs here, it seems to me that there could be quite a duplication. We have the Canadian federation of agriculture presenting a brief. They represent the wheat growers in western Canada. Then there are the grain growing organizations, there are the different groups and there are the dairy farmers and all the federations within the province. It seems to me that these people should get together and put it all in one brief instead of coming individually. The farmers union could be included as well, because their thinking would be on the same line. Then they could bring in one brief and this would save a lot of time and would help very much in the problem with which we are dealing.

Mr. FORBES: That would be a good idea.

The CHAIRMAN: No doubt, these organizations will appear before us. If the committee does not get from the organizations the information that we desire, then we have power to call other organizations.

Mr. MILLIGAN: Yes, that would be so.

An hon. MEMBER: Or other manufacturers.

Mr. HORNER (*Acadia*): Perhaps the farmers union and the Canadian federation of agriculture would not like to submit a unitized brief. Each may prefer to submit its own brief. Perhaps we could hear those briefs on the same day and have both groups sitting before us and ask both of them questions on the same day. That would speed up the matter very much.

Mr. SMALLWOOD: Mr. Chairman, would you give some guidance on this matter? Will you include the farmers unions and the federation of agriculture?

Mr. MILLIGAN: I was thinking of the Canadian federation and the farmers unions. The Canadian federation covers a lot of the ground. The farmers unions would cover right across Canada and would be the voice of agriculture.

Mr. NASSERDEN: Mr. Chairman, there is one trouble that you would run into there. The federation and the farmers unions are on a national basis. Their brief will be so broad or so general that we will not get down to anything specific that would be of any value to us. I was not objecting to their coming here but I think I should make that general comment. It is not going to help us very much, actually, in preparing for the questions that we will want to ask anybody else who comes before us. And if you get the smaller farm organizations, they may come up with the same problem that has been regionally significant to them. You will be covering the country and the province, and thereby affecting the different phases of our industry across Canada.

Mr. MILLIGAN: The federation of agriculture will be composed of different representations and different groups across Canada, such as the three western wheat pools. The grain growers will be represented as well as representatives from each of the provinces. Therefore we would be in a position to question them, and they could offer suggestions, when they are here.

Mr. FORBES: Perhaps the clerk would be good enough to read the names of the organizations who have indicated a desire to come before the committee.

The CHAIRMAN: Very well. We will have it read again.

The CLERK OF THE COMMITTEE: The following are prepared to present a brief and send representatives to appear before the committee:

Massey-Ferguson Ltd., Saskatchewan Farmers Union, Ontario Retail Farm Equipment Dealers, Interprovincial Farm Union Council, Canadian Federation of Agriculture, Saskatchewan Wheat Pool, Canadian Labour Congress, International Harvester Company, The Canadian Co-operative Implements Ltd., Cockshutt Farm Equipment Limited, and the government of Saskatchewan.

The CHAIRMAN: These organizations may be bringing with them a lot of witnesses whom we will have an opportunity to cross-examine, or representatives of various branches of their organizations that are members. I am thinking of the federation of agriculture, which takes in quite a large membership, and I am thinking of various segments of agriculture which will no doubt come along with them.

Mr. KINDT: I am afraid that if we make just one brief do for all, like the federation of agriculture, we would be getting farther and farther away from the grass roots farmer. That is the point of difference between Mr. Smallwood and myself. If you are going to make it superficial and up in the clouds, you might just as well sweep it into the corner and forget about it entirely. I think we must get this thing down as close to the farmer as we possibly can. I think we should do everything that we possibly can with any means at our disposal.

Mr. HORNER (*Acadia*): Have all these groups been asked to come by the committee, or have they just presented their views?

The CHAIRMAN: They were contacted by letter. The clerk of the committee read the list of those who replied indicating a desire to come.

Mr. HORNER (*Acadia*): I noticed one implement company was not mentioned. I refer to John Deere Plow.

The CHAIRMAN: They declined to come.

Mr. HORNER (*Acadia*): Then I suggest on that particular basis we should ask them to come. If the company desires to have somebody here, they can have them here whether they want to come or not. I suggest that we have them, even though they do not wish to come.

Mr. MILLIGAN: You mentioned co-operatives of Ontario and the dairy farmers of Canada. There would be no limit to the number of organizations you could ask to come to present briefs. It is all right if these people want to come, but I think that if they want to bring in briefs, then others should have the opportunity to do so as well. Bu it will take a lot of time.

Mr. KINDT: There is a little difference. The people whose names have been read have indicated that they are willing to come. I do not know what the correspondence was between our former chairman and these various organizations. But if they have been asked, I think they should be encouraged to come and present their briefs.

The CHAIRMAN: This was done on a voluntary basis. First of all they were asked to come voluntarily. But we have the power to summon them if the committee so wishes. I would not suggest that we immediately start off in that vein. However, these are the ones who have indicated their desire to come.

Mr. KINDT: We do not want to shut them out.

The CHAIRMAN: No, definitely not.

Mr. SMALLWOOD: Nobody is trying to shut them out. We only want to get a joint presentation, if they are along the same idea. We want to get this thing going, otherwise it will last two or three years.

Mr. KNOWLES: As we proceed with it, if we find we need something else, we have the power to get it later at any time.

The CHAIRMAN: That is correct.

Mr. FORBES: If I understand it correctly, the John Deere Company are manufacturers solely in the United States. Allis-Chalmers-Rumley Ltd. are another, and so are Minneapolis-Moline. I think it is important that we have one of these companies appear, since they manufacture their goods in the United States and sell them in Canada.

Mr. KINDT: I do too.

The CHAIRMAN: You have a good point.

Mr. SOUTHAM: This follows my suggestion that dairy equipment be included.

The CHAIRMAN: Is there any further discussion this morning?

Mr. NASSERDEN: I move we adjourn.

The CHAIRMAN: It has been moved that we adjourn. We shall meet again on Friday morning at 9.30 in room 112-N, when we shall hear from the economics division.

HOUSE OF COMMONS

Fourth Session—Twenty-fourth Parliament
1960-61

STANDING COMMITTEE

ON

Agriculture and Colonization

Chairman: JAMES A. McBAIN, Esq.

Respecting

PRICES OF FARM MACHINERY

FRIDAY, MARCH 24, 1961

From the *Department of Agriculture*: Dr. M. E. Andal, Chief of Productions, Economics Division; Mr. Gordon Haase, Officer in Charge, Economics Division, Edmonton, Alberta; Dr. K. W. Hill, Associate Director (Agronomy) Research Branch.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY
OTTAWA, 1961

(Quorum 15)

Clyde Lyons,
Clerk of the Committee.

MINUTES OF PROCEEDINGS

FRIDAY, March 24, 1961.

(3)

The Standing Committee on Agriculture and Colonization met at 9.35 a.m. this day. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Campbell (*Lambton-Kent*), Clancy, Clermont, Danforth, Doucett, Drouin, Dubois, Fane, Forbes, Hicks, Horner (*Acadia*), Howe, McBain, Montgomery, Muir (*Lisgar*), Nasserden, Racine, Rapp, Ricard, Rompre, Smith (*Lincoln*), Southam, Tardif, Thomas, Villeneuve and Webb.—27

In attendance: From the Department of Agriculture: Dr. M. E. Andal, Chief of Productions, Economics Division; Mr. Gordon Haase, Officer in Charge, Economics Division, Edmonton, Alberta; and Dr. K. W. Hill, Associate Director Agronomy, Research Branch.

The Clerk read the report of the meeting of the subcommittee on Agenda and Procedure which was held Tuesday, March 21st; (*See this day's proceedings*).

The Chairman introduced the witnesses to the Committee.

Dr. M. E. Andal reviewed the background for the booklet entitled—"A summary of statistics relative to the enquiry into the Price of Farm Machinery." which was the subject matter of today's meeting.

Mr. Gordon Haase then explained the booklet in detail.

Mr. Danforth, seconded by Mr. Horner (*Acadia*) moved that the Dominion Bureau of Statistics be asked to submit a written statement on how the figures used by the Economists in the booklet were obtained.

The witnesses agreed to obtain this information for the Committee.

Agreed,—that the booklet—"A summary of statistics relative to the enquiry into the price of farm Machinery." be printed as an appendix to today's proceedings; (*See Appendix "A"*).

The Chairman thanked the witnesses for their appearance.

At 11.00 a.m. the Committee adjourned until Friday, April 14th at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

PROCEEDINGS

FRIDAY, March 24, 1961.

The CHAIRMAN: Gentlemen, I see a quorum on hand. Our first item this morning will be the report of the subcommittee on agenda and procedure. I will ask Mr. Lyons to read that report.

The CLERK OF THE COMMITTEE:

TUESDAY, March 21, 1961.

A tentative schedule for appearance of witnesses was discussed and the following schedule agreed to:

- April 14 Friday —Canadian Federation of Agriculture.
- “ 17 Monday—Government of Saskatchewan.
- “ 21 Friday —Interprovincial Farm Union Council.
- “ 24 Monday—Saskatchewan Farmers Union.
- “ 28 Friday —Canadian Labour Congress.
- May 1 Monday—Massey-Ferguson.
- “ 5 Friday —Cockshutt Farm Equipment.
- “ 8 Monday—Ontario Retail Farm Implements.
- “ 12 Friday—International Harvesters.
- “ 15 Monday—Canadian Cooperative Implements Ltd.

(A copy will be distributed to Members of the Committee).

Agreed.—That the appearances of the Alberta Wheat Pool and the Saskatchewan Wheat Pool be deferred.

The Clerk was instructed to write to the pools asking them what information they proposed to offer on farm machinery prices.

Discussion of the appearance of companies concerned with the manufacture of dairy and barn machinery followed.

The Clerk was instructed to write to the leading companies concerned with this type of machinery and ask them if they were prepared to present briefs and/or send representatives to appear before this Committee.

The CHAIRMAN: Is there any discussion on that report?

Mr. MUIR (*Lisgar*): I understand we are all getting copies of that list.

The CHAIRMAN: That is correct.

Mr. FORBES: So you are not going to give us an extended Easter holiday?

Mr. THOMAS: Will there be further hearings after this? Does the chairman and the steering committee feel that this represents the number of groups that will be called to testify?

The CHAIRMAN: Mr. Lyons has referred to five additional machinery companies that are in the manufacture, more or less, of dairy equipment and stable equipment. I might read out these to the committee. They are the Pedlar People Limited, Messrs. Beatty Brothers, deLaval Company, Messrs. Babson Brothers Company (Canada) Limited, and Jutras Limited of Victoriaville, Quebec. We are not sure until we receive replies from these companies whether they desire to appear here or not.

Mr. DANFORTH: What is the procedure of the committee, if it happens that we are unable to finish with a witness or a brief on any particular day? Will there be extra meetings, or what is the procedure if we are unable to conclude a single presentation at a single meeting?

The CHAIRMAN: We will have to arrange for additional meetings; if not that day, then we will have to try and arrange for the next day so as not to hold witnesses over for an extended period of time.

Mr. DANFORTH: It is anticipated that we will not have to finish a brief within the normal sitting of one meeting?

The CHAIRMAN: I believe Mr. Lyons has arranged for the various rooms on these days, for an all-day sitting if necessary. We may have to sit while the House of Commons is sitting, to finish up a brief.

Mr. BOULANGER: Would it be possible to have the meetings in the afternoon? Many members go home at weekends and it is difficult to be here on Monday morning. To be here at 9.30 on Monday one would have to leave home on Sunday night. There are quite a few members in that position.

The CHAIRMAN: No doubt Mr. Boulanger and members will be here on Monday in the afternoon, and possibly in the evening.

Mr. BOULANGER: This document says 9.30.

The CHAIRMAN: That is the start of the meeting on Monday. We hope that will be an inducement for members to be back on Monday. We will be starting at 9.30 a.m.

Mr. BOULANGER: We will be back, but it is a question of being in here at 9.30 a.m.

Mr. DROUIN: I agree with Boulanger. There is a train coming into the station not later than 10.30 a.m., and one could arrange to be here for 10.30 a.m.

The CHAIRMAN: I think we would find it difficult to secure rooms on other days of the week. That is why the committee has decided to start on Monday morning. We realize that some members come from the east and would have difficulty in being in here early in the morning. If it is possible we might make the morning proceedings brief so that they could take part in the same proceedings later on in the day. Is there any further discussion? If not, I understand that the committee takes that report as read.

Gentlemen, this morning we have with us Dr. M. E. Andal, chief of productions, economics division, Department of Agriculture; Mr. Gordon Haase, officer in charge, economics division, Department of Agriculture, Edmonton, Alberta; and Dr. K. W. Hill, associate director of Agronomy, research branch, Department of Agriculture. In addition we have Mr. Ralph A. Stutt and Mr. Varge Gilchrist who are just appearing as observers, and whom you may desire to have as witnesses.

You will recall that the committee instructed the economics branch to prepare a booklet—which I believe you all have in your hands, in both languages. We are very fortunate to have prepared the copies in the French language and they are available for you this morning.

Also, we have an interpreter on hand this morning; should you desire to ask questions in French you may do so.

At this time I will call on Dr. Andal who may wish to explain just how this little booklet was prepared. I will call on Mr. Haase later to review the booklet before you.

Dr. M. E. ANDAL (*Chief of Productions, Economics Division, Department of Agriculture*): Mr. Chairman, as you indicated, last year the committee asked that a booklet be prepared giving the background statistical information that would be helpful to the committee.

The economics division of the Department of Agriculture was asked to prepare this material and to cover four topics. One was to indicate the rise in farm machinery prices in relation to changes in prices of other machinery products. The second topic was to show costs of machinery operation, and to show the cost in relation to other farm costs. The third point was to give an indication of the value of machinery on farms, and this was done on a per acre basis since the acreage varies over the years. The final point to be covered was to give an indication of Canadian production of farm machinery, and the sales of that machinery both in Canada and other countries, and also to show the source of Canadian sales, that is, the sales of machinery in Canada which come from Canadian production, as well as the amount which comes from other countries.

These, then, are the points covered in the report which we have to present to you today. The committee indicated that this material should be available on a regional basis for different parts of the country, and that it should cover a period of about 15 years. That has been done in this report.

These statistics are taken from the dominion bureau of statistics and an acknowledgment is made of the assistance provided by the agricultural division, and by the prices division of that bureau, in the compilation of this report.

Mr. Gordon Haase, who is head of the economics division, in Alberta, prepared this report and he is now ready to present it to you.

The CHAIRMAN: Thank you very much, Dr. Andal. I believe Mr. Haase has done a tremendous amount of work in preparing this report. So I think we should hear from Mr. Haase. Possibly you would like to go over the report. We will probably entertain questions as we go along. This might brighten up the proceedings here this morning.

Mr. DANFORTH: Before Mr. Haase starts,—I cannot anticipate his report, of course,—would it be possible for him to indicate how the figures were obtained? I am very interested in knowing the manner in which the various figures were obtained, in order that we may have some idea of exactly how stable and authentic the report may be.

I am particularly interested to know whether the figures were given on a voluntary basis. You speak of machinery on farms. I would like to know whether questionnaires were sent out to a representative group of farmers to obtain these figures, and I would like to know whether or not the machinery companies were asked periodically to submit prices, wholesale or retail.

I think the committee would be very interested if you might possibly give us a general background of the method by which the figures were obtained for the basis of this report.

Just to say "dominion bureau of statistics" gives only a general picture. I wonder if something cannot be done to bring it a little more down to the factual level, so that we may ascertain how these figures were obtained.

Mr. Gordon HAASE (*Officer in Charge, Economics Division, Department of Agriculture, Edmonton, Alberta*): Mr. Chairman, this is a question of going beneath the official figures published by the dominion bureau of statistics and this is a thing which we did not do. The procedures which the bureau follow in the collection of these statistics, I presume, would be a matter which they might explain, but which, I am afraid, I am not prepared to do.

Mr. DANFORTH: I am completely satisfied with the answer, provided we know that that was the basis of the report. That was the point of my question; to know where and when these figures were obtained.

Mr. HAASE: Yes. These are official figures published by the dominion bureau of statistics, and the source of these statistics in the various tables is indicated to be that.

The CHAIRMAN: Before we go into the brief further, is it the wish of the committee that the whole report be made an appendix to our proceedings today? I think it would be advisable to have it as part of our proceedings. Is that agreeable to the committee, then?

Agreed.

(See Appendix A)

Will you please carry on Mr. Haase?

Mr. HAASE: Thank you. If I may presume to read, word for word at the beginning here, it is to explain somewhat more fully what is involved in the index numbers, particularly, that we have used in dealing with this information. It is customary to describe the general economic situation in terms of the index number. This is what we have done. So, if I might, I would like to read this first section into the record as a description of what will follow:

The data presented in this section show the general trend of price movements in Canada for the period 1939 to 1959. They consist of four sets of index numbers. These are: the general wholesale price index, the index of farm prices of agricultural products, the index of prices of commodities and services used by farmers and the farm machinery farm price index. The base period in each instance is 1935-1939=100.

The general wholesale price index is a combined index of eight major group indexes.¹ These chief component material groups are vegetable products; animal products; fibres, textiles and textile products; wood, wood products and paper; iron and its products; non-ferrous metals (including gold); non-metallic minerals; and chemicals and allied products.

The purpose of this index is to attempt to show the general level of all prices in the country. It is an average, weighted measure of the general level of all prices.

The index of farm prices of agricultural products shows price changes of field and animal products sold by farmers. This index is based on prices for about 50 farm products which contributed approximately 90 per cent of the total cash income received by farmers from the sale of farm products during the base period. The index of prices of commodities and services used by farmers is a composite index and consists of three parts, i.e. (1) equipment and materials (farm machinery; building materials; gasoline, oil and grease; feed; fertilizer; binder twine; seed, and hardware). (2) taxes and interest rates, and (3) farm wage rates. Retail prices are used for the equipment and materials index. One of the components of the index is the farm machinery and equipment group for which a sub-index is calculated. A selection of the machinery and equipment used on Canadian farms the relative importance of the various kinds and types used by farmers. The index is a "price" index and expresses current prices as a percentage of prices in 1935-39. It is a measure of the impact of price change on the cost of purchasing a fixed quantity and quality of machinery and equipment.

The general tendency of various prices which are shown by these statistics is of relevance to this inquiry. The general wholesale price index is a measure of the trend of all prices. This index, (Chart 1 and Table 1) shows an upward tendency of prices throughout the period under review, with a peak in 1951 from which prices declined until about 1954 and then resumed an upward movement.

While there is a tendency of all prices to move in a manner of the general price level, it is also a characteristic of the prices of certain goods to move both earlier and further than the average, and at the same time the prices of other goods can be seen to move more slowly and sometimes by smaller amounts than the general level of prices. Thus it may be seen from chart 1 that the index of the prices of a group of commodities and services which farmers use

in their business, i.e. the composite farm index (exclusive of farm living costs), rose in about the same manner as the general level of all prices until about 1951. Since that time, however, the composite farm index of farm costs has risen by a greater extent and now stands substantially above the average level of the index of wholesale prices. At the same time the index of the prices of farm products rose faster than both prices in general and farm costs until 1951 and has fallen relatively further since that time. When prices of farm products are compared with the prices of things that farmers buy, the relative purchasing power of farm products in terms of these requirements is obtained. When both these groups of prices move in the same direction and at the same rate the purchasing power of farm products is not affected to any degree. However, when farm product prices rise relative to the cost of things that farmers buy, the purchasing power of these farm products is accordingly increased. On the other hand, with the prices of farm products falling relative to the prices of commodities and services which farmers buy, their purchasing power correspondingly declines. Reference to Chart 1 and the data upon which it is based indicates that this situation has prevailed in Canada since about 1951.

Of immediate interest to this inquiry, chart 1 also shows that while farm machinery prices have risen throughout the period under review, they have risen by a smaller amount than the prices of some of the other commodities shown. Thus the prices of farm machinery increased more slowly than the general level of all prices over the period 1939-1957, but since 1957 this group of prices increase relatively more than the general price level. At the same time the index of the prices of the commodities and services which farmers use, i.e. the composite farm index and which includes the prices of farm machinery, rose by a greater amount than the prices of farm machinery alone. Since about 1952, however, the prices of farm machinery including the other items farmers use have tended to increase more rapidly than the composite farm cost index. Finally, throughout the period 1939-1951 the index of the prices of farm products rose considerably faster than the prices of the commodities and services which farmers use and the prices of farm machinery in particular. Throughout this 12-year period the purchasing power of farm products in terms of these other items including machinery was correspondingly increased. However as chart 1 shows the price of farm products declined drastically from 1951-1955, and their purchasing power declined accordingly since the index of farm costs, including machinery prices, continued to rise. Since 1955, the rise in the index of farm product prices has been less than the rise in the composite farm costs index and less than the index of farm machinery prices in particular. This resulted in a continued and further decline in purchasing power of farm products.

Mr. DANFORTH: I notice we have a full agenda and perhaps it is not possible to have more witnesses in front of the committee. I am wondering if it would be possible to have from the bureau of statistics, agricultural branch, a written submission as to the mechanics and the manner in which these basic figures were obtained. I think this would give us a basis for this report.

The CHAIRMAN: Would that be possible?

Mr. HAASE: I am sure it would.

Mr. DANFORTH: I am sure it would lend a lot of credence to this report if we had a submission as to the mechanics by which this was obtained. The whole report is based on these figures.

The CHAIRMAN: Perhaps we might have this available for our first meeting after the Easter recess.

Mr. BOULANGER (*Interpretation*): I see no real necessity for statisticians and economists appearing before this committee to tell this committee how these figures have been obtained.

Mr. NASSERDEN: I think it is very important that this be established right at the outset. This is a very important inquiry. A number of people will be quoting from it. We want to be very sure that everything that is quoted is based on something that is solid and factual.

Mr. TARDIF: Is it possible that this committee does not believe that what has been compiled here is factual.

Mr. DANFORTH: I am asking that the bureau of statistics submit to us a written report as to the mechanics by which these figures were prepared. I am not casting any aspersions, but I want to be sure in my own mind as to how these figures were obtained and that they do represent the picture that is portrayed.

Mr. TARDIF: If the persons who prepared these figures are efficient—and I am sure they are—they must have been prepared from the best source.

Mr. DANFORTH: If you were on a farm like some of us, you might have some doubt too.

Mr. HORNER (*Acadia*): I think Mr. Danforth's suggestion is a very good one. Very few people who will be reading this report will have any knowledge as to how the figures are obtained. Of course they realize they are dominion bureau of statistics figures, but I think the whole report will be founded upon these figures and they will act as a base for discussion. I think Mr. Danforth's suggestion that we obtain a statement as to how these figures are obtained is a very good one, because then it will be in the record as to where we start from. I wholeheartedly support the suggestion.

Mr. BOULANGER (*Interpretation*): I have no objection to a written submission, but I would object most strenuously to taking up the time of two or three meetings in explaining how these figures are obtained.

Mr. DANFORTH: A written submission is all we have asked for.

Mr. MUIR (*Lisgar*): I think it is important that we know the source. No one is questioning the ability of the people in the dominion bureau of statistics; but as a group which will be investigating these prices, I think it is only right we should know on what the prices are based. There is no point in our going ahead with this thing in ignorance of how this information is gathered. It would be senseless. A simple statement from the bureau of statistics is all we need.

Mr. FANE: I just want to support Mr. Danforth's request for this statement, because the farmers whom we represent will be asking us where the figures were obtained and how.

I would like to know whether the Dominion bureau of statistics obtained these figures from machinery companies; if not, I would like to know where they secured them. I must say that the farmers nowadays are not people who do not know what they are doing. They are well informed and able people. They are businessmen today. It is not the misfits who go onto the farms, stay there and make a success. These people are farming because they want to farm. As I say, they are businessmen who know what the score is. It is our duty to show them where we get our information and so on.

Mr. HORNER (*Acadia*): Mr. Chairman, I do not know whether it is your wish to allow questions to be asked in connection with the breakdown of this as we proceed. I have one question to ask in connection with Mr. Haase's last statement, in that in a sense the farm machinery prices have risen quite sharply in comparison with other commodities a farmer must purchase. Could Mr. Haase give his views as to whether or not this is just cause for this inquiry?

Mr. HAASE: I would not presume to put an opinion on the record in that regard.

Mr. MUIR (*Lisgar*): Mr. Chairman, I have a supplementary question on that.

The CHAIRMAN: Proceed.

Mr. MUIR (*Lisgar*): I note that in the early period of which you spoke, machinery prices had not kept advancing as quickly as the other commodities. Would you say that the later advance has brought the machinery prices over the level of the other commodity prices, or just up to them?

Mr. HAASE: I do not think one can say that one way or the other. The use of this index is based on starting them all together for the base period 1935 to 1939. The trend of these indices shows from that time forward, how the relationship has changed since then. We commenced here with the prices of machinery and all other prices in the period 1935 to 1939, and then traced the changes since that time. If one group has risen faster than the other, then the line appears higher on the chart. However, all the index shows now is the relationship today compared with what the relationship was in 1935 to 1939.

Mr. FORBES: May I ask if these figures are based on the Dominion of Canada, and are they a broad rather than a regional estimate?

Mr. HAASE: They are built up from regional data, and throughout the report the data is shown by provinces.

Mr. FORBES: If I may say so, those in western Canada are quite suspicious of that weighted average. My point is this: They are using the income of farmers in association with the index for the cost of machinery. Am I right in that? If I am correct in saying that, then that would differ very widely in various regions and your weighted average would not give a true picture in any particular region.

Mr. HORNER (*Acadia*): No, but they give a picture encompassing all of Canada.

Mr. DANFORTH: It would be impossible to get it on a regional basis?

Mr. FORBES: I am beginning to wonder if this is a course of action we should have followed in the first place.

The CHAIRMAN: If there are no further questions I would ask Mr. Haase to proceed. May I explain why I asked to have this put in as an appendix. These officials have been brought here to explain the brief and, in order to save time, I suggested that we make it an appendix, and then we could allow them to elaborate on any particular part of it.

Would you proceed with page 7—the farm income situation in Canada?

Mr. DANFORTH: Mr. Chairman, I have a general question to ask Mr. Haase, which is based on the work he has done. Mr. Haase, I know that you and your associates, in compiling this report, must have been involved in a tremendous amount of work. Within the terms of reference, is it the feeling of your associates that the terms of reference were broad enough that we have been able to obtain in this report the comparative picture for which we are asking?

Mr. HAASE: Yes. This is our understanding of both the terms of reference and this material.

Mr. DANFORTH: But my question is whether you feel the terms of reference are broad enough to give us this picture for which we are looking. This is a general question, and I am not trying to pin you down. However, we do wish to know. We are very determined, as a committee, to get this picture and I am just asking if you and your associates do feel that within the terms of reference it has been possible to design such a picture for us.

Mr. HAASE: Our understanding of the terms of reference was that we were to describe the general agricultural situation of our outline, in sufficient outline so that farm machinery prices might be fitted into the context.

Mr. DANFORTH: Then, thereby give us the complete picture.

Mr. HAASE: Yes. Then, dealing with the farm income situation in Canada, we say that a presentation of the general income situation on Canadian farms may be helpful for an understanding of the effects of the movements of the prices of particular cost items. The changes in the prices of farm products and in the prices of commodities and services which farmers use have been described. These changes are now translated into the over-all income situation of farm costs and net returns for the farms in Canada and each of the provinces. In the following charts the gross farm income for all the farms in Canada and for the farms in each province is shown for the years 1946-1959. The cash operating expenses and non-cash farm expenses, mainly depreciation, are subtracted from gross returns to obtain net farm income. Examination of Chart 2(a) suggests that since about 1948 gross farm income in Canada has tended to remain comparatively stable given the expected short term ups and downs of which the increases in 1951-1952 were larger than usual. At the same time farm expenses, both cash and non-cash, have tended to increase consistently throughout the period and this is depicted by a consistent widening of the space between gross and net farm income. The result has been that net farm income has tended to decline over the period 1948-1959, again with the expected short run ups and downs of which the increase in 1951 was larger than usual.

This pressure on net farm income is regarded as the result of the so-called cost-price squeeze in agriculture. The behavior of certain farm prices was examined in Chart 1 and the results of these price movements can be interpreted in terms of their final effects upon total farm income and expenses. This is due to the fact that the farm operator in the course of his business can and does adjust to price changes by reducing his expenditures on high cost items and substituting other items which are relatively cheaper. Furthermore, technological advances permit increases in efficiency. Thus, it can be noted that total farm expenses have not increased to the same extent as some of the prices of individual commodities that farmers buy. At the same time it should be noted that the increase in farm expenses, both cash and non-cash, has been the result of an increase to some extent in the prices of all things that farmers use, although the prices of these commodities have not all risen at the same rate. It should also be noted that this changing relationship of farm income and expense has had different effects in each province, reflecting the particular types of farming that are practised.

The following portion of our summary is mainly statistical. It shows charts, and the data on which the charts are based for Canada as a whole and then, for each province.

Mr. HORNER (*Acadia*): Could Mr. Haase explain one point? We all have some idea of net farm income and non-cash expenses, but what would be included in the term "cash expenses"?

Mr. HAASE: Mr. Chairman, these are statistics which have been secured from the dominion bureau of statistics and the cash expenses to which Mr. Horner refers are as follows: interest on indebtedness, seed and feed purchases, tractor expenses, truck expenses, automobile expenses, or rather that portion of automobile expenses which is due to farm business, engine and combine costs, machinery repairs, fertilizer for agricultural land, food and beef supplies, building repairs, electrical power and a miscellaneous item. Added to these are expenditures for hired labour.

Mr. FORBES: What do you classify as non-cash expenses?

Mr. HAASE: Mainly depreciation on machinery and farm buildings.

Mr. DANFORTH: In your brief you state that farm expenses, both cash and non-cash, have tended to increase consistently. With reference to non-cash expenses, covering depreciation on farm buildings and on machinery, do we

anticipate the increase there is due to the farmers buying more expensive machinery and putting up more expensive buildings?

Mr. HAASE: Not directly. All it implies is that there is more investment in machinery and buildings on farms.

Mr. MONTGOMERY: Is there any distinction made between the residences and barns? When you speak of farm buildings, are you referring to all buildings? I believe our difficulty is due to the fact that we do not know how the dominion bureau of statistics drew up these figures. When I return to my constituency these figures will not tell the farmer very much. He will say: "how did they get these figures. They do not apply here". That is the trouble.

Mr. HORNER (*Acadia*): In a generalizing statement, Mr. Haase, would you say that cash expenses vary according to the intensification of farming carried out in the various provinces?

Mr. HAASE: Oh, yes.

The CHAIRMAN: If there are no further questions, I shall ask Mr. Haase to continue.

Mr. HAASE: Having examined the general situation of farm prices and farm income in Canada, it is now possible to look more specifically at the effect of rising farm machinery prices upon farm economy. Cash farm expenses include the current costs of operating farm machinery, and non-cash farm expenses include depreciation on farm equipment. These farm machinery expenses are shown in charts 3 (a) and 3 (b). The tendency of these costs has been to rise over the period 1946 to 1959 in each province of Canada. Cash and non-cash farm machinery costs are shown on a per acre basis and I might say, Mr. Chairman, the reason for showing these costs on a per acre basis is that the alternative is to show them on a per farm basis and, as the size of farms in this country has been increasing over the past period of years, there is an element of increased machinery costs and total costs per farm. That is associated with the increased farm size and has nothing to do in itself with the prices of these items, and that is why it is reduced to a per acre basis for these calculations.

Mr. BOULANGER (*Interpretation*): I should like to put a question for the purposes of elucidation. What are we to understand by the word "acre"? Does it mean an acre that can be cultivated or does it mean pasture land, wood lots and things like that?

Mr. HAASE: The acreage figures used in this table are total acreages of crops, plus summer fallow, and do not include improved pasture.

Mr. VILLENEUVE: Tillable soil?

Mr. HAASE: With the improved pasture left out.

Mr. HORNER (*Acadia*): Improved pasture would include brome-grass and so on?

Mr. HAASE: Yes, that is left out of these calculations.

Machinery efficiency over the period under review has been increasing at the same time that prices have been rising. If the efficiency of a machine in terms of number of acres it will handle rises at the same rate as the price of the machine, then the farmer's machinery costs per acre operated would not be greatly affected. It is only when the price of machinery rises faster than its efficiency in farm use that a real machinery cost increase is realized. However, machinery is used with other farm resources such as land and labor, and the increased use of machinery has to some extent replaced labor. Thus, some increase in machinery cost per acre can occur without a corresponding rise in the total costs per acre. It is recognized that not all of the machinery and equipment is used for crop production and that the proportion of these to the total varies considerably between provinces. Costs of such equipment are not related particularly to acreages and this would affect the cost per acre com-

parisons between provinces. However, since much of the machinery and equipment is used for crop production it was considered useful to show the costs on a per acre basis.

Two significant aspects of machinery costs in Canada are evident in chart 3. In the first place the rise in machinery costs per acre in Canada has been significant over the period, but at the same time, in relation to the rise in prices of other commodities and services used by farmers, it has been moderate. In the second place there are wide differences between provinces in the extent to which this cost increase has taken place. Thus, although in the prairie provinces the costs have more than doubled, they have now risen as much as elsewhere. In the central provinces the increase has been more substantial while in Nova Scotia and British Columbia the increase has been extreme. To some extent these differences represent a situation where a considerable amount of mechanization had taken place in the prairie provinces before 1946 and consequently the increase in machinery costs has not been as great since that time. It also, however, reflects changes in farm organization that have taken place in certain regions which have had the effect of counteracting the effects of increased costs on individual farms. Thus, in the prairie areas particularly, increases in sizes of farms tended to reduce per acre costs. This is particularly true in the case of machinery use which is generally more efficient on larger units. The greatly increased expenditures per farm for machinery are a result of increased farm size as well as of increased per acre costs.

Differences in costs per acre between regions reflects differences in the types of farming that are practised in these areas. In the prairie areas, for example, an extensive type of agriculture is generally practised, and costs and returns per acre are lower than in many other regions where agriculture is more intensively practised. There are differences, too, in the proportion of total costs represented by machinery costs. The relative impact of increased machinery costs on incomes of farmers between regions is therefore not necessarily directly related to the level of per acre costs or to the size of the increase since 1946.

On that point I made some additional calculations to show the relative importance of machinery costs in comparison with total farm costs in different regions. In general, the situation would be this: for the recent period, 1955 to 1959, in the prairie provinces, machinery costs comprise from 50 to 55 per cent of total farm expenses. In the central provinces and British Columbia, Nova Scotia and New Brunswick, machinery costs represent only between 20 and 25 per cent, and in Prince Edward Island the situation is similar but a little higher, between 25 and 30 per cent. This is the relative importance of machinery costs in relation to total costs.

MR. RAPP: You said 55 per cent for the prairie provinces? Is that the average?

MR. HAASE: That is the average for all the farms for the four-year period for the three prairie provinces.

MR. DANFORTH: May I ask a question for clarification? Am I to understand the significance of the 29 and 30 per cent? In your calculations here, if the efficiency of machinery has increased correspondingly with the increase in price, then we feel there is no increase in the cost of machinery.

MR. HAASE: There would be no increase in the cost of machinery, but when you look at this on a per acre basis, and you see a rise in cost per acre, then this is evidence that the price has risen faster than efficiency. If your efficiency were to double and the number of acres were to double, then if the price of machinery doubled, the per acre basis would be the same.

MR. DANFORTH: I can understand that when you have continued larger acreage; but what I question is what happens to the farmer when he is only

able to have a limited acreage but must, because of the type of machinery, buy machines with increased efficiency?

Mr. HAASE: He falls outside the class I was talking about; he is not able to take full advantage of the efficiency of machines.

Mr. DANFORTH: Perhaps it does represent a marked increase in the cost of machinery, but that is outside the scope of the farmer in this report.

Mr. HAASE: It is outside the generalization I made at that particular point.

Mr. HORNER (*Acadia*): Would it not affect the cost of machinery per acre and the efficiency, if the efficiency is kept up with the cost? Would you not have to take into consideration what that acreage is producing in relation to the fluctuation of intensified production, particularly on the graph on page 32, that the cost of machinery in Manitoba, particularly, has sharply risen in comparison to the prairie provinces? It seems to me that this could come about because of the greater intensification in that province of farming methods and production. In making a full analysis of its efficiency, would you not have to take into consideration what that acre is producing?

Mr. HAASE: I do not presume to analyze efficiency. What I was doing was harkening back to this per acre calculation.

Mr. HORNER (*Acadia*): My question follows up the statement you made to Mr. Danforth, that the cost would remain the same if the acreage increased with the cost of the machinery. While this may be true as to efficiency—you used the word "efficiency" there—it would have to depend on what that acreage would be producing.

Mr. HAASE: It presumes that the comparison is within one kind of farming.

The CHAIRMAN: These gentlemen appearing before us this morning will be available to appear again. They are standing by at any time. I imagine they will be here quite frequently, perhaps not as witnesses all the time, but just sitting in on the proceedings.

Mr. MUIR (*Lisgar*): I think it is a good idea to have the report attached.

The reporters are taking this down. Is there any reason why we should attach this thing, with printing costs so high and so on?

The CHAIRMAN: It is brought in here to get these charts down. That is why I suggest we attach it to these proceedings, to make the charts available.

Mr. THOMAS: In regard to depreciation, and the computing of amounts of depreciation on farm machinery, could you give us the list of the rate of depreciation applied to each class of machinery?

Mr. HAASE: No, I cannot. This would be a matter of going beneath the official statistics of the bureau, which I think it would not be appropriate for me to do.

Mr. THOMAS: Have you any idea how it is arrived at?

Mr. HAASE: A general idea. I would say that the basis of depreciation would be the same over the period, so that if you did see an increase in the allowance for depreciation this would not reflect changes in calculations. This would be a real rise over the period.

Mr. THOMAS: I know that for income tax purposes a certain schedule of depreciation is set up by the income tax authorities.

Mr. HAASE: Yes.

Mr. THOMAS: It would be reasonable to suppose, then, that possibly the D.B.S. uses the same rate of depreciation.

Mr. HAASE: No, I would not think so. The depreciation allowance in the Income Tax Act is a matter of law; the depreciation in the calculation of farm costs is a matter of economics.

Mr. THOMAS: Do you think it is very important that we should have the rates that are used in these calculations?

Mr. HAASE: It can be obtained, I am sure.

Mr. NASSERDEN: I think it would be a very good suggestion. Why do you think improvement in grassland should not be included in the cultivated acreages for the purpose of that report?

Mr. HAASE: I have no reason for leaving it out except that the calculation was facilitated by so doing. There was an unbroken series of the other acreages and this is what I used.

Mr. NASSERDEN: Does it cast an inaccurate position in so far as machinery costs are concerned on many farms in Canada?

Mr. HAASE: Yes. I believe that in some cases the figures for improved pasture are not available. If not, it was not possible to construct the full series over the full period.

Mr. NASSERDEN: I think that particularly down here in Ontario, in parts of Quebec and in parts of the maritimes, like Prince Edward Island, you would not have much of a report if you did not have them, as far as machinery costs are concerned.

Mr. BOULANGER (*Interpretation*): In so far as operating costs of machinery are concerned, are the operating costs of pleasure cars, trucks and so on included?

Mr. HAASE: No.

Mr. TARDIF: There are some farmers in Canada who use planes for supervising their land and so on. Was that taken into consideration in obtaining the calculation of the average that was reached?

Mr. HAASE: That I do not know.

Mr. NASSERDEN: About this matter of grassland being included in cultivated acreage: I think it is important because in recent years there has been quite a turn to silage equipment of a mechanical nature, and to a highly mechanized type of equipment for grassland farming.

So unless you have the acreage seeded to crops that they harvest with this machinery, you are going to have a very inaccurate calculation.

Mr. HAASE: I would say that while the acreages have been left out, the costs of operating machinery are included, so to that extent the total cost of the farming operation of these provinces is relevant. This recognizes, of course, that the per acre calculation, as it has been maintained throughout the whole comparison, may not be as revealing in the case of one province as it is in the case of another region under a different type of farming.

Mr. NASSERDEN: That is exactly the point I am getting at, because any comparison between one province and another is not accurate.

Mr. HAASE: I would say this: that this is an example of an instance in which comparisons between provinces may not be fully drawn from this date.

Mr. HORNER (*Acadia*): My first question stems out of the question asked by Mr. Nasserden. That is why I wanted to make it clear as to the progress of cultivation, because in the crop books of western Canada cultivated tame hays are considered cultivated grass, while in these graphs they are not.

Mr. HAASE: I think we could have considered them as cultivated acreage. It is a statistical problem. But I am not able to get an estimate of the tame hays, and to know whether or not they have been included in the series.

The alternative would be to have field crops and summerfallow in some of the years, and only in certain years could the tame hays be put in. But it would destroy the continuity of the comparison.

Mr. HORNER (*Acadia*): The point I want to make is this: in this case is it agreed that perhaps hay crops have been on the increase on the prairies to some

extent in recent years? I am thinking of my own province, Alberta, particularly, which is considered now as a mixed farming province. We have a lot of live-stock to raise, and we have cultivated pastures as well, particularly in the irrigated areas.

Would not your grass here tend to rise over the past few years, because to a certain extent this is cultivated grass? But under this term there may be a somewhat smaller grass acreage increase?

Mr. HAASE: Yes. To the extent that there is a rising trend in a cultivated grass crop, that is so. But that has been left out of the comparison. Your conclusion would seem to me to be correct.

Mr. HORNER (*Acadia*): I have one other question. It deals with a statement you made on page 30, referring to the extent of mechanization in the prairie provinces in comparison with other provinces. It is at about the middle of page 30, and it reads as follows:

To some extent these differences represent a situation where a considerable amount of mechanization had taken place in the prairie provinces before 1946 and consequently the increase in machinery costs has not been as great since that time.

While I realize this is true, I still think there has been a considerable changeover in farm machinery in the prairie provinces since 1946. This may not make as big a difference, possibly, as you suggest.

Mr. HAASE: Yes. I did not suggest it has made a great difference. I mentioned the point. But I think you anticipate the next section, Mr. Chairman, which is on the matter of overall investment in farm machinery.

Mr. DUBOIS (*Interpretation*): Is machinery used in dairy production included in the graph we have here?

Mr. HAASE: Yes.

Mr. DROUIN (*After speaking in French, not interpreted, continued in English*): In the north part of my riding farming is difficult as there is a great deal of rock. They have to buy small bulldozers. The bulldozer blade is taxable at eleven per cent. The plow is clear of tax, but the wheel to control the plow is taxed.

(*Interpretation*): Do you not feel that all such machinery used in agriculture should be tax exempt so as to reduce the cost?

Mr. HAASE: Well, I would have no feelings on the matter; but I would say certainly if it were all tax exempt that would reduce the cost.

Mr. BOULANGER (*Interpretation*): In so far as acreage is concerned I wonder whether it would be a good idea to request the department of agriculture to break down these figures of acreage per province as to cultivated land, pasture land and uncultivated land, so that we would have this for purposes of comparison.

Mr. HAASE: I think that information might be obtained within a fairly short time.

Mr. BOULANGER (*Interpretation*): We could have it, for instance, for 1956 and would be able to determine whether the number of cultivated acres in Saskatchewan, for example, has increased.

The CHAIRMAN: Possibly Mr. Haase might include that information along with the other information for our next meeting after the Easter recess.

Mr. FANE: I would like to ask Mr. Haase if the acreage was obtained from the permit books in western Canada or from bureau of statistics information.

Mr. HAASE: It is bureau of statistics data which we have in this regard

Mr. FANE: Does the bureau of statistics obtain its information from that contained in the permit book.

Mr. HAASE: I do not know.

Mr. NASSERDEN: Would you please find that out. I also would like to ascertain whether they included the acreage seeded to grass. I ask this question because I see that they enter it in the book as cultivated acreage in western Canada.

The CHAIRMAN: We will obtain that information for you.

Would you proceed with page 44 Mr. Haase.

Mr. HAASE: Speaking of the investment in farm machinery and implements in Canada, we say that the total value of machinery on farms is examined in this section to show the amount of investment or overhead that it represents on the farms of Canada. This machinery investment is again shown on a per acre basis since the crop and summerfallow acreages have also increased over the period under review. In terms of machinery overhead on Canadian farms, two significant aspects may be observed from Chart 4. In the first place for the country as a whole the machinery overhead per acre has tended to remain fairly constant since 1951. At the same time there are again wide regional differences in the amount of machinery overhead required in different parts of the country. Thus, in the prairie provinces machinery overhead actually has declined over recent years. This again reflects changes in farm organization and machinery use which are taking place in this area. The central provinces and the maritimes on the other hand, show consistent and significant increases in machinery investment per acre over the whole period under review, while the increases in British Columbia particularly before 1954 have been extreme. This also indicates that mechanization developed at different times in the various regions. Fluctuations in incomes also have an effect on the timing and extent of machinery purchases.

The CHAIRMAN: Are there any questions on this page?

Mr. MUIR (*Lisgar*): Mr. Chairman, as we have only fifteen minutes remaining, perhaps we should allow Mr. Haase to finish the brief. I note that there is only a short paragraph left.

The CHAIRMAN: If the committee is agreeable, we will allow Mr. Haase to finish it. After he has completed the brief, we then will devote the remainder of our time to questions.

Mr. Haase, would you continue at page 56, which refers to sales of farm implements and equipment, and repair parts in Canada.

Mr. HAASE: Mr. Chairman, on the subject of sales of farm implements and equipment and repair parts in Canada, chart 5 and supporting tables shows the total implement and equipment sales including repair parts for Canada and each province for the period 1946-1959. These data indicate that total expenditures on machinery and repairs for Canada, as a whole, tends to move within a fairly narrow range. These expenditures increased a moderate amount during the period of 1946 to 1952, declined abruptly until 1954 and have increased slightly since that date.

The same regional differences have occurred with respect to machinery sales as was shown in the cases of per acre total machinery investment and machinery operating costs. Sales in the prairie provinces have been comparatively low with the central and maritime provinces in an intermediate position, and the sales of machinery per crop and summerfallow acre in British Columbia being shown at a significantly higher amount.

Mr. Chairman, again this comparison rests, for calculation, on the per acreage basis because, while the sales per acre in the prairie provinces have been low, between one-half and two-thirds of total machinery sales have been in the prairie provinces in recent periods.

Sales of implements and repair parts tend to vary from year to year. This variation has long been recognized to be associated with variations in the net farm income of the respective year. While the change in sales over the period is not large, changes from year to year are, however, occasionally highly significant as a proportion of total sales.

Mr. DANFORTH: May I ask a question? Since the sales of farm implements and repairs are lumped together, is there anywhere in your summary a breakdown between the sale of new implements and the cost of repairs?

Mr. HAASE: Yes, Mr. Chairman. On page 58 and the following pages farm equipment sales and repair parts are shown separately, and the total is carried into the chart for purposes of comparison.

Mr. HORNER (*Acadia*): I have a question stemming out of something Mr. Haase said with regard to the percentage sold in western Canada. Does transportation play a large part in the costs of machinery, and could he prepare a breakdown of the amount of machinery sales in each province? I think this would be useful in determining the actual costs as between machinery and its transportation.

Mr. HAASE: Yes, the tables show machinery sales and repairs per province, but they are not broken down into the components of the cost.

Mr. HORNER (*Acadia*): I am thinking of this from the transportation angle and the weight of tractors. Does this show the percentage of tractors sold in every area?

Mr. FORBES: In other words, does it take freight rates into account?

Mr. HORNER (*Acadia*): Is this information obtainable?

Mr. HAASE: I could see.

Mr. HORNER (*Acadia*): If you would, I think it would be useful in pursuing our work in the days ahead.

Mr. THOMAS: When you speak of sales of farm implements would that only be new implements, or would it also include used implements? For example, a farmer may take in his old tractor and trade it in for a new one and the dealer will sell off the old tractor.

Mr. HAASE: I believe this is sales of new equipment.

Mr. THOMAS: Would you make sure of that?

Mr. HAASE: Yes.

The CHAIRMAN: If there are no further questions we shall proceed to page 66 of the summary.

Mr. HAASE: In this section there is a preliminary outline of the farm machinery industry in Canada and of the nature of the Canadian market for machinery. Chart 6 indicates that since 1948 a substantial proportion of Canadian produced farm machinery has been exported. I might add that in the last year of the comparison, 1958, about 75 per cent of the machinery produced in Canada was exported and about 25 per cent of the machinery produced in this country was sold on the domestic market. At the same time, as indicated by chart 7, a large proportion of machinery sales in Canada consists of imported machines. It has been recognized that there is the tendency of some manufacturing companies to specialize in the production of certain of their lines of machines in Canada and of certain other lines in other countries.

Now, the important point shown by chart 7 and table 7 is that in 1958, for example, fifteen per cent of the total machinery sold in Canada was produced in Canada and 85 per cent of the machinery sold in this country was imported. The question was raised at an early meeting about the net position with regard to the United States in connection with our trade in farm machinery, and I have some figures for three or four recent years.

In 1958 imports of farm machinery from the United States were in the order of \$190 million. Exports of Canadian products to the United States were in the order of \$90 million, taking into account all re-exports, covering machinery which was imported into Canada and then exported again, the net position with regard to the United States in machinery, in the year 1958, was a surplus of some \$98 million of imports over exports. In 1957, on the same basis, the net import from the United States was in the order of \$133 million and, in 1956, the net import was in the order of \$196 million.

Mr. DANFORTH: By net import do you mean total imports from the States?

Mr. HAASE: No, it is the surplus of imports over exports.

Mr. DANFORTH: Is there a Canadian deficit to that extent?

Mr. HAASE: Yes.

Mr. BOULANGER (*Interpretation*): Up to this time we have been dealing with these figures which have been provided by the dominion bureau of statistics. I, for one, do not see the usefulness of dealing, at any great length, with these. These are, of course, interesting, but the function of the committee is to look into the prices of agricultural machinery. That is our job, and I think we should deal from now on with the price of agricultural machinery.

Mr. HORNER (*Acadia*): I have a question on a point that Mr. Haase made, that 15 per cent of machinery sold in Canada is produced in Canada and 85 per cent sold in Canada is imported. Stemming out of the inquiry that we must look into the cost of these machines, I wonder if Mr. Haase could prepare a statement on this point, in view of the fact that transportation and labour and the cost of raw materials all bear a factor in the cost of machinery. Could Mr. Haase prepare a statement as to what makes up this 15 per cent of Canada's purchases of agricultural machinery; in other words, what machines are produced in Canada, and if possible where? We might then look fully into the whole problem of transportation and all the other components that go into it.

Mr. HAASE: That might be done, Mr. Chairman; the picture of the portion of Canadian production that is exported is fairly readily available. The major export of farm machines is the combine. In 1959 the total farm machinery exports from Canada were in the order of 110 million, of which something like 47 million was combines.

Mr. HORNER (*Acadia*): My question deals more with what is left behind, what we are making in Canada and buying in Canada. I do not know whether the dominion bureau of statistics could obtain this information. I would like to know what these combines are sold for, where they are exported overseas.

Mr. DANFORTH: I have a question arising out of the statement by Mr. Haase. Could we have more information on the statement you made, sir, concerning machinery that is imported into Canada and re-exported? I am interested in that particular phase of it.

Mr. HAASE: I might say that this is a relatively small amount. In 1958 it was in the order of 1,300,000, in 1957 in the order of 1,700,000 and in 1956 in the order of 1,200,000.

Mr. NASSERDEN: I have a few observations that I would like to make. First of all, I can see you have done a great deal of work on this report, but I do feel that, without the cultivated areas in grass in all parts of Canada, this report is rather meaningless in so far as trying to establish a basis for machinery cost per acre in different types of agriculture in concerned. It is true, perhaps, that you could only estimate those figures. I believe also that the acreage now used is also estimated in certain parts of Canada, if that is a fact, because if they have not got the figure for one type of cultivation, they probably have not got the figures for other types of cultivation. From the

standpoint that this report will be quoted and may be a source of information in the future for determining the cost of machinery to different types of activity, I think it should include the cultivated acreages in grassland right across the country.

Mr. HAASE: I would be glad to get the best estimates of this item available, Mr. Chairman, and besides that whether or not you wish to have some new calculations made up on the basis of these other figures.

Mr. FORBES: Before you leave, do I understand the services of Mr. Haase and the other economists here will be available to the committee throughout this hearing?

The CHAIRMAN: That is the understanding.

At our next meeting we expect to have the brief here ahead of time. These companies and organizations will send us their briefs a week ahead of the meeting. If you bring those briefs with you at the next meeting, gentlemen, it would be helpful, as they might be limited.

Also, there is one other clarification arising out of the proceedings of the last meeting regarding the John Deere Company. It was stated at that time, and the records show, that they had refused to come. I will ask Mr. Lyons to explain.

The CLERK OF THE COMMITTEE: I wrote a letter to the vice president and general manager of John Deere, Welland works, and he in turn, wrote to the vice president and general sales manager at their head office at Winnipeg. He had not replied so, during the past week I wrote to Mr. Trimble. They had not declined to come.

The CHAIRMAN: Before adjourning I wish to thank Dr. Andal and Mr. Haase for being here and preparing their statistical information. We will make wide use of it in the proceedings after the Easter recess.

APPENDIX "A"

A SUMMARY OF STATISTICS
RELATIVE TO THE ENQUIRY INTO THE
PRICE OF FARM MACHINERY

Prepared for

THE STANDING COMMITTEE
OF THE HOUSE OF COMMONS

GENERAL PRICE MOVEMENTS IN CANADA

The data presented in this section show the general trend of price movements in Canada for the period 1939 to 1959. They consist of four sets of index numbers. These are: the general wholesale price index, the index of farm prices of agricultural products, the index of prices of commodities and services used by farmers and the farm machinery farm price index. The base period in each instance is 1935-1939 = 100.

The general wholesale price index is a combined index of eight major group indexes.¹ These chief component material groups are vegetable products; animal products; fibres, textiles and textile products; wood, wood products and paper; iron and its products; non-ferrous metals (including gold); non-metallic minerals; and chemicals and allied products. The index of farm prices of agricultural products shows price changes of field and animal products sold by farmers. This index is based on prices for about 50 farm products which contributed approximately 90 per cent of the total cash income received by farmers from the sale of farm products during the base period. The index of prices of commodities and services used by farmers is a composite index and consists of three parts, i.e. (1) equipment and materials (farm machinery; building materials; gasoline, oil and grease; feed; fertilizer, binder twine; seed; and hardware), (2) taxes and interest rates, and (3) farm wage rates. Retail prices are used for the equipment and materials index. One of the components of the index is the farm machinery and equipment group for which a sub-index is calculated. A selection of the machinery and equipment used on Canadian farms is contained in this sub-group index and the items are weighted to represent the relative importance of the various kinds and types used by farmers. The index is a "price" index and expresses current prices as a percentage of prices in 1935-39. It is a measure of the impact of price change on the cost of purchasing a fixed quantity and quality of machinery and equipment.

The general tendency of various prices which are shown by these statistics is of relevance to this inquiry. The general wholesale price index is a measure of the trend of all prices. This index, (Chart 1 and Table 1) shows an upward tendency of prices throughout the period under review, with a peak in 1951 from which prices declined until about 1954 and then resumed an upward movement.

While there is a tendency of all prices to move in a manner of the general price level, it is also a characteristic of the prices of certain goods to move both earlier and further than the average, and at the same time the prices of other goods can be seen to move more slowly and sometimes by smaller amounts than the general level of prices. Thus it may be seen from Chart 1 that the index of the prices of a group of commodities and services which farmers use in their business, i.e. the composite farm index (exclusive of farm living costs), rose in about the same manner as the general level of all prices until about 1951. Since that time, however, the composite farm index of farm costs has risen by a greater extent and now stands substantially above the average level of the index of wholesale prices. At the same time the index of the prices of farm products rose faster than both prices in general and farm costs until 1951 and has fallen relatively further since that time. When prices of farm products are compared with the prices of things that farmers buy, the relative purchasing power of farm products in terms of these requirements is obtained, given a particular level of productivity. When both these groups of prices move in the same direction and at the same rate the purchasing power of farm products is not affected to any degree. However, when farm product prices rise relative to the cost of things that farmers buy, the purchasing power of these farm

¹ For a detailed account of the construction of the wholesale price index see Dominion Bureau of Statistics Reference Paper No. 24—"Wholesale Price Indexes. 1913-1950 (1935-39 = 100).

products is accordingly increased. On the other hand, with the prices of farm products falling relative to the prices of commodities and services which farmers buy, their purchasing power correspondingly declines. Reference to Chart 1 indicates that this situation has prevailed in Canada since about 1951.

Of immediate interest to this inquiry, Chart 1 also shows that while farm machinery prices have risen throughout the period under review, they have risen by a smaller amount than the prices of some of the other commodities shown. Thus the prices of farm machinery increased more slowly than the general level of all prices over the period 1939-1957, but since 1957 this group of prices increased relatively more than the general price level. At the same time the index of the prices of the commodities and services which farmers use, i.e. the composite farm index and which includes the prices of farm machinery, rose by a greater amount than the prices of farm machinery alone. Since about 1952, however, the prices of farm machinery have tended to increase more rapidly than the composite farm cost index. Finally, throughout the period 1939-1951 the index of the prices of farm products rose considerably faster than the prices of the commodities and services which farmers use and the prices of farm machinery in particular. Throughout this 12-year period the purchasing power of farm products in terms of these other items including machinery was correspondingly increased. However as Chart 1 shows the price of farm products declined drastically from 1951-1955, and their purchasing power declined accordingly since the index of farm costs, including machinery prices, continued to rise. Since 1955, the rise in the index of farm product prices has been less than the rise in the composite farm costs index and less than the index of farm machinery prices in particular. This resulted in a continued and further decline in purchasing power.

^c Western grain prices used in the construction of the index prior to August 1, 1959 are final prices. Since August 1, 1959 only initial prices are available for wheat, oats and barley.

THE FARM INCOME SITUATION IN CANADA

A presentation of the general income situation on Canadian farms may be helpful for an understanding of the effects of the movements of the prices of particular cost items. The changes in the prices of farm products and in the prices of commodities and services which farmers use have been described. These changes are now translated into the over-all income situation of farm costs and net returns for the farms in Canada and each of the provinces. In the following charts the gross farm income for all the farms in Canada and for the farms in each province is shown for the years 1946-1959. The cash operating expenses and non-cash farm expenses, mainly depreciation, are subtracted from gross returns to obtain net farm income. Examination of Chart 2(a) suggests that since about 1948 gross farm income in Canada has tended to remain comparatively stable given the expected short term ups and downs of which the increases in 1951-1952 were larger than usual. At the same time farm expenses, both cash and non-cash, have tended to increase consistently throughout the period and this is depicted by a consistent widening of the space between gross and net farm income. The result has been that net farm income has tended to decline over the period 1948-1959, again with the expected short run ups and downs of which the increase in 1951 was larger than usual.

This pressure on net farm income is regarded as the result of the so-called cost-price squeeze in agriculture. The behavior of certain farm prices was examined in Chart 1 and the results of these price movements can be interpreted in terms of their final effects upon total farm income and expenses. This is due to the fact that the farm operator in the course of his business can and does adjust to price changes by reducing his expenditures on high cost items and substituting other items which are relatively cheaper, also, technological advances permit increases in efficiency. Thus, it can be noted that total farm expenses have not increased to the same extent as some of the prices of individual commodities that farmers buy. At the same time it should be noted that the increase in farm expenses, both cash and non-cash, has been the result of an increase to some extent, in the prices of all things that farmers use, although the prices of these commodities have not all risen at the same rate. It should also be noted that this changing relationship of farm income and expense has had different effects in each province reflecting the particular types of farming that are practised.

FARM COSTS AND FARM MACHINERY PRICES IN CANADA

Having examined the general situation of farm prices and farm income in Canada, it is now possible to look more specifically at the effect of rising farm machinery prices upon the farm economy. Cash farm expenses include the current costs of operating farm machinery, and the non-cash farm expenses include depreciation on farm equipment. These farm machinery expenses are shown in Charts 3(a) and 3(b). The tendency of these costs has been to rise over the period 1946-1959 in each province of Canada. Cash and non-cash farm machinery costs are shown on a per acre basis. Machinery efficiency over the period under review has been increasing at the same time that prices have been rising. If the efficiency of a machine in terms of number of acres it will handle rises at the same rate as the price of the machine, then the farmer's machinery costs per acre operated would not be greatly affected. It is only when the price of machinery rises faster than its efficiency in farm use that a real machinery cost increase is realized. However, machinery is used with other farm resources such as land and labor, and the increased use of machinery has to some extent replaced labor. Thus, some increase in machinery cost per acre can occur without a corresponding rise in the total costs per acre. It is recognized that not all of the machinery and equipment is used for crop production and that the proportion of these to the total varies considerably between provinces. Costs of such equipment are not related particularly to acreages and this would affect the cost per acre comparisons between provinces. However, since much of the machinery and equipment is used for crop production it was considered useful to show the costs on a per acre basis.

Two significant aspects of machinery costs in Canada are evident in Chart 3. In the first place the rise in machinery costs per acre in Canada has been significant over the period, but at the same time, in relation to the rise in prices of other commodities and services used by farmers, it has been moderate. In the second place there are wide differences between provinces in the extent to which this cost increase has taken place. Thus, although in the prairie provinces the costs have more than doubled, they have not risen as much as elsewhere. In the central provinces the increase has been more substantial while in Nova Scotia and British Columbia the increase has been extreme. To some extent these differences represent a situation where a considerable amount of mechanization had taken place in the Prairie Provinces before 1946 and consequently the increase in machinery costs has not been as great since that time. It also, however, reflects changes in farm organization that have taken place in certain regions which have had the effect of counteracting the effects of increased costs on individual farms. Thus, in the prairie areas particularly, increases in sizes of farms tended to reduce per acre costs. This is particularly true in the case of machinery use which is generally more efficient on larger units. The greatly increased expenditures per farm for machinery are a result of increased farm size as well as of increased per acre costs.

Differences in costs per acre between regions reflects differences in the types of farming that are practised in these areas. In the prairie areas, for example, an extensive type of agriculture is generally practised, and costs and returns per acre are lower than in many other regions where agriculture is more intensively practised. There are differences, too, in the proportion of total costs represented by machinery costs. The relative impact of increased machinery costs on incomes of farmers between regions is therefore not necessarily directly related to the level of per acre costs or to the size of the increase since 1946.

THE INVESTMENT IN FARM MACHINERY AND IMPLEMENTS IN CANADA

The total value of machinery on farms is examined in this section to show the amount of investment or overhead that it represents on the farms of Canada. This machinery investment is shown on a per acre basis since the crop and summerfallow acreages have also increased over the period under review. In terms of machinery overhead on Canadian farms, two significant aspects may be observed from Chart 4. In the first place for the country as a whole the machinery overhead per acre has tended to remain fairly constant since 1951. At the same time there are again wide regional differences in the amount of machinery overhead required in different parts of the country. Thus, in the prairie provinces machinery overhead actually has declined over recent years. This again reflects changes in farm organization and machinery use which are taking place in this area. The central provinces and the maritimes on the other hand, show consistent and significant increases in machinery investment per acre over the whole period under review, while the increases in British Columbia particularly before 1954 have been extreme. This also indicates that mechanization developed at different times in the various regions. Fluctuations in incomes also have an effect on the timing and extent of machinery purchases.

SALES OF FARM IMPLEMENTS AND EQUIPMENT AND REPAIR PARTS IN CANADA

Chart 5 and supporting tables shows the total implement and equipment sales including repair parts for Canada and each province for the period 1946-1959. These data indicate that total expenditures on machinery and repairs for Canada, as a whole, tends to move within a fairly narrow range. These expenditures increased a moderate amount during the period of 1946 to 1952, declined abruptly until 1954 and have increased slightly since that date.

The same regional differences have occurred with respect to machinery sales as was shown in the cases of per acre total machinery investment and machinery operating costs. Sales in the prairie provinces have been comparatively low with the central and maritime provinces in an intermediate position, and the sales of machinery per crop and summerfallow acre in British Columbia being shown at a significantly higher amount.

Sales of implements and repair parts tend to vary from year to year. This variation has long been recognized to be associated with variations in the net farm income of the respective year. While the change in sales over the period is not large, changes from year to year are, however, occasionally highly significant as a proportion of total sales.

THE PRODUCTION, DOMESTIC SALES, IMPORTS AND EXPORTS IN THE FARM MACHINERY INDUSTRY IN CANADA

Charts 6 and 7 give a preliminary outline of the structure of farm machinery industry in Canada and of the nature of the Canadian market for machinery. Chart 6 indicates that since about 1948 a substantial proportion of Canadian produced farm machinery has been exported. At the same time, as indicated by Chart 7, a large proportion of machinery sales in Canada consists of imported machines. It has been recognized that there is the tendency of some manufacturing companies to specialize in the production of certain of their lines of machines in Canada and of certain other lines in other countries.

Chart 6.—Value of Machinery Production in Canada, Exports plus Domestic Sales per Crop and Summerfallow Acre, 1946–1958

MINUTES OF PROCEEDINGS

FRIDAY, April 14, 1961.

(4)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Argue, Badanai, Belzile, Boulanger, Campbell (*Lambton-Kent*), Clermont, Cooper, Danforth, Doucett, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), Knowles, McBain, Milligan, Montgomery, Muir (*Lisgar*), Nasserden, Pascoe, Phillips, Rapp, Regnier, Ricard, Rompre, Southam, Stefanson, Thomas, Tucker and Webb—(31).

In attendance: From The Canadian Federation of Agriculture: Dr. H. H. Hannam, President; Dr. W. C. Hopper, Economist and Mr. David Kirk, Secretary.

Dr. Hannam presented a brief on behalf of the Canadian Federation of Agriculture regarding farm machinery prices.

The Committee questioned Dr. Hannam, Dr. Hopper and Mr. Kirk on the Federation's brief.

Moved by Mr. Southam, seconded by Mr. Fane,

Agreed—that a copy of a questionnaire on *Profit or Loss with Machinery* sent out by the National Farm Radio Forum be made an appendix to this day's proceedings. (*See Appendix "A" to this day's minutes of proceedings.*)

At 11.00 a.m. this Committee adjourned until 2.30 p.m.

AFTERNOON SITTING

(5)

The Committee reconvened at 2.40 p.m. Mr. McBain, the Chairman, presided.

Members present: Messrs. Argue, Boulanger, Brunsdén, Campbell (*Lambton-Kent*), Clermont, Cooper, Danforth, Doucett, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), Knowles, McBain, Montgomery, Muir (*Lisgar*), Nasserden, Pascoe, Peters, Rapp, Rogers, Rompre, Southam, Stefanson, Thomas and Tucker—(27).

In attendance: Same as at morning sitting.

The Clerk of the Committee read a telegram from the Alberta Wheat Pool.

Dr. Hannam read a supplementary statement regarding the Federation's brief.

Questioning of the officials of the Canadian Federation of Agriculture was continued.

The Committee thanked the officers of the Canadian Federation of Agriculture for their appearance.

At 4.15 p.m. the Committee adjourned until Friday, April 21st at 9.30 a.m.

Clyde Lyons,

Clerk of the Committee.

APPENDIX "A"

NATIONAL FARM RADIO FORUM

National Summary

Editor-Manager—Rodger Schwass

Topic—Profit or Loss with Machinery

Date—March 6, 1961

No. of reports—284

Total attendance—3237

Average group size—11.6

Opinion of Broadcast: *Good 155 Fair 71 Poor 2 No comment—35*

1. Do you think more standardization of machinery is needed?

Yes	252 forums
No	6 "

What parts do you want standardized?

Mower sections and guards	81 forums
Power take-off shafts	71 "
Nuts and bolts	70 "
Ploughshares	68 "
Three-point hitches	53 "
Implement wheels & tires	46 "
Chains for equipment	31 "
Ball and roller bearings	24 "
Fewer models and sizes	18 "
Oil filters	14 "
Hydraulic fittings	4 "

2. What recommendations do you have for the House of Commons Committee on Agriculture and Colonization, which we could pass along?

- (a) There should be government control of markup and profits.
- (b) A major test centre should be set up to prepare reports on all new farm machines entering the market.
- (c) High repair parts costs should be investigated.
- (d) The possibility of excessive profits in the farm machinery industry should be investigated.
- (e) Farm equipment companies (particularly relating to safety) should be forced by law to standardize.
- (f) Warranties should be checked for accuracy and authenticity, and dealers should be licensed.

3. What other opinions do you have about the cost of farm machinery?

- (a) Farm machinery prices are out of line with farm product prices.
- (b) Dealer and manufacturer markup is too high.
- (c) A multiplicity of models, styles, and power ranges increases cost without increasing true value to the farmer.
- (d) Repair costs are far too high.
- (e) Impractical "extras" should be left off tractors. Farmers themselves should boycott such fad items as power steering.
- (f) Machinery quality is not as high as in times past.

Comments

"It should be a law that new developments in machinery be tested and faced with a government standard before being placed on the market. Federal legislation should be passed similar to that of Saskatchewan stating that agencies, in order to keep their license, must fully back warranties on equipment."

Musquodobit-Brookvale, N.S.

"Stop buying large high priced equipment with all the extras to force companies to produce smaller and less expensive models, the same as the automobile companies."

Lobo Centre, Ontario

"Some machinery costs too much and isn't always suitable. We would like to see more economy tractors and other machinery and never mind the fancy lights or seats. The large pieces of machinery like combines are too expensive for most farmers so it's better for one to get one of them and do custom work for the others."

High and Low Forest, P.Q.

"Costs of machinery are too high, Government should intervene to cut profits. Co-operatives should be encouraged to go into the manufacture of farm implements."

Forums Ruraux Acadiens, N.B.

March 28, 1961

EVIDENCE

FRIDAY, April 14, 1961.

The CHAIRMAN: Gentlemen, I believe we have a quorum this morning. I am pleased to welcome again Dr. H. H. Hannam, who is at present the President of the Canadian Federation of Agriculture; Dr. W. C. Hopper, economist; and Mr. David Kirk, secretary of the Canadian Federation of Agriculture.

Before we proceed further, probably I should mention the fact that each member of the committee has already received the revised schedule of appearances of witnesses, the brief submitted by the Alberta Wheat Pool—they will not be making a personal appearance—the brief of the Canadian Congress of Labour; and a booklet entitled "Our Future is Linked Together" prepared by the Farm Equipment Institute of North America. This was sent to us by the chairman of the Canadian information committee of the institute, Mr. H. L. Hickey.

I also hope each member of the committee has brought his copy of the brief of the Canadian Federation of Agriculture with him, as our supply is limited.

I might mention that we hope these briefs will be presented a week in advance as requested, and I must remind all members of the committee to bring the briefs with them as I have no doubt the supply is limited.

At this time I would like to call on Dr. Hannam to present the brief from the Canadian Federation of Agriculture.

Dr. HANNAM (*President, Canadian Federation of Agriculture*): Mr. Chairman and gentlemen, we are happy to have this opportunity to present a brief to you. I hope you will not feel too badly about the appearance or size of the brief. We have suggested that I should read to you only the double-spaced sections. All of the sections in single spacing are an elaboration of the general text. It is there for your information and in many cases it will give you an idea why we have made certain statements and why we have presented certain views and recommendations. In that way I hope you will not feel it is too long.

What we have tried to do in this brief is to bring to you the collective views of the farmers across Canada. We have done a very substantial amount of work on this brief by having sent out a questionnaire to all of our principal bodies, having them pass them on to their local committees and individuals. Then we have provincially and nationally tabulated the results.

This, then, is a composite of farm opinions in respect to the farm implement business.

Mr. Chairman and Members:

It is not surprising that the cost of farm machinery, repairs and parts, and the need for exploration of every possibility for the reduction of such cost, has been a continuing concern of farmers, their organizations, and of governments over the years.

Farmers in all income brackets recognize that if they are to be efficient in the production of agricultural commodities of all kinds they will have to depend to a major extent on the adoption of modern, labour-saving machinery. The result is that machinery costs represent a steadily larger part of the farmer's total costs. As well, his costs measured as a proportion of his gross revenue continue to climb steadily.

With this pressure to increasing mechanization has gone a steady rise, in the post-war period, in prices of farm machinery, and farm machinery repairs and parts.

Finally, we find that, in the face of this pressure to invest in machinery, and the rising cost of such machinery, prices received for farm products have not risen correspondingly. The farmer is in a cost-price squeeze and it is both inevitable, and proper, that the possibilities of reducing farm machinery costs should come in for the closest examination.

In constant dollars the national net income from farming in 1959 was 35 per cent below what it was in 1949. During the same decade the number of farm operators in Canada declined by 210,000 or about 33 per cent. In spite of this striking reduction the net income per operator in constant dollars in 1959 was 5 per cent lower than it was in 1949. If the cost of commodities and services required by farmers had fallen to some extent as their incomes their situation would not be so difficult but this is not the case. These essential goods and services including farm living costs have actually risen during the decade by about 30 per cent.

Yet in spite of this cost-price squeeze Canada's 450,000 farm operators purchased in one year (1959), new farm machinery and equipment with a wholesale value of \$212 million and repairs to the value of \$39 million, which when added together and put on a retail price level would be in the neighbourhood of \$315 million, or about \$700.00 per operator.

In these calculations cash discounts to farmer buyers, and trade-ins, were not taken into account. This great expenditure and substantial scale of investment took place in spite of relatively low farm incomes, compared with the incomes of those of other occupations with comparable capital investments. This makes it clear how considerable is the pressure of developing technology on the farmer and how vital to the survival of these producers of food for the people in Canada are these implements of production and their maintenance in a working condition.

The problem in perspective

Almost every answer we received from farmers to a questionnaire, which was circulated widely by our member organizations across Canada, stated that it is the low level of their incomes that has been the principal factor determining the extent to which they have been able to purchase new machinery. The emphasis here on the income, rather than on the cost side of the cost-price dilemma, is we think significant and illustrates a point which we want to make clear at the outset.

In our view the basic difficulties of agriculture arise out of the technological forces making for rapidly rising productivity in agriculture, together with the failure of the demand for farm products to increase correspondingly. The result is a chronic tendency to overproduce and a downward pressure on farm prices and on numbers of farmers.

We think that farmers recognize this fact, and would not want us to run any risk of leaving an impression that we think the problems of agriculture are essentially caused by exploitative increases in costs, though these can be damaging when they occur. To leave such an impression would not serve the best interests of farm policy needs in Canada.

It is in the improvement of conditions of marketing and pricing of farm products, in expansion of markets, in the creation of economic opportunity for rural people, and in progressive credit and resource use policies that the greatest hopes for improvement in the farmer's condition lie.

We do not make this point to underrate the importance of this inquiry, but rather to keep its significance in proper perspective. An inquiry such as

this is of real importance to the farmer. More, because it deals with the efficiency and productivity of one part of our manufacturing and distribution system, it is a matter of importance to Canada as a whole—as is any inquiry into ways and means of augmenting our national wealth and productivity.

Having made this point, we propose in the balance of this presentation to confine our attention quite strictly to the question before us—that of farm machinery prices and costs.

General conclusion

We should perhaps begin by stating, in very general terms, the basic conclusions at which we have arrived in regard to this question. These conclusions are two in number:

1. The greatest possibilities for reducing the cost to the farmer of the machinery and repairs that he buys lie in the improvement of the distributive system, rather than on the manufacturing side. In this distributive system, of course, the farm machinery manufacturers are deeply involved. This view is borne out by the experience in the business of Canadian Co-operative Implements Limited. Also, added point and emphasis is given to it by reflecting that in the farm machinery industry we enjoy reciprocal free trade arrangements with the United States, and have duty-free entry from all countries. We export a large proportion of Canadian production to the U.S. and from it we import some 80 per cent of all the farm machinery purchases made by Canadian farmers. If farm machinery prices are excessively high, even before the addition of the distributive margin, we are faced with a North American, not merely a Canadian, problem.

2. In relation to the manufacturing sector, the greatest possibility of substantial gains lies in increased measures of standardization, in the making of fewer model changes, and similar technical progress which would be, in turn, reflected in lower costs to the farmer. Here again, it is necessary to bear in mind that we buy and manufacture farm machinery in a North American market, and the need for international cooperation in this area definitely arises.

The recommendations we will be making at the conclusion of this submission reflect these broad conclusions.

The extent of farm investment in machinery

The large and increasing investment in farm machinery required for modern farming is well known and need not detain us here, especially since the committee is being provided with the statistical data by the Canada Department of Agriculture and the dominion bureau of statistics. The 1960 Canada year book states that the average investment per farm in machinery has, in constant dollars, and over the last 20 years, increased by 213%. This single figure, indicating a tripling of the physical capital in machinery employed by the farmer, tells the story. Expressed in current dollars, the increase would of course be very much greater.

Some specific examples of capital investment in machinery, changes in this capital over the years, and the proportion that machinery investment bears to total farm investment are given below, and are obtained from farm management studies by the economics division of the Canada Department of Agriculture and the Ontario department of agriculture:

Then follows a number of examples, which refer to different provinces.

In the Creston area of British Columbia the average cost of machinery per cultivated acre ranged from \$11 on grain farms to \$33 on fruit farms

and the average on all farms was \$17. These farms included those specializing in dairying, grain, small fruits and livestock. The study was made in 1955.

A study made on 100 dairy farms in eastern Ontario in 1957 provided an interesting comparison of the increase in the investment in machinery between 1948 and 1957 (in current dollars). For farms selling milk for fluid consumption the increase was from \$4,200 to \$6,600. For farms supplying milk for processing the increase was from \$2,900 to \$3,600.

In 1958, on representative Ontario farms, the proportion of the total farm capital invested in machinery was 19 per cent for dairy specialty farms, 15 per cent for beef steer farms and 21 per cent for cash crop farms.

Another study shows that in 1919 Ontario dairy farmers had on the average machinery and equipment to the value of \$980 or 6 per cent of the total farm capital. In 1958, the same study shows the investment in machinery and equipment on the average was \$7,393 or 18 per cent of the total farm capital.

In 1959 the farmers submitting farm account books to the Ontario agricultural college for analysis had an average machinery expense per farm for that one year of from \$1,837 for beef and processed milk farms, to \$3,903 for cash crop farms. For most of the other types of farms the annual expense was well over \$3,000 per farm or more than \$16 per crop acre.

The report of a Saskatchewan study in 1956 shows that the average investment per crop acre was about \$19 for small farms (235 to 320 acres), \$17.50 for medium sized farms (530 to 640 acres), and \$14.60 for large farms (950 to 1465 acres).

In 1959 the farm business summary prepared from the operations of 42 farm management clubs in Saskatchewan, with a total of 455 members, showed that machinery and equipment represented about 17 per cent of the total farm capital.

On farms on the grey wooded soils of Alberta in 1955 more than one-third of the total annual farm costs were on the average attributable to the costs of machinery and equipment.

In West Central Manitoba on 19 half section grain and livestock farms with a total average capital investment of about \$20,000 in 1956, the value of machinery and equipment was \$4372 or about 22 per cent.

On 21 three-quarter section grain farms in the Red River Valley the average investment in machinery and equipment was about 20 per cent of the total farm capital.

A survey made by us of farmers' views from all areas of Canada have yielded many useful facts, suggestions and recommendations on the subject matter of this enquiry. The sections which follow are in considerable part based on an analysis, in condensed form, of the answers to the questions which we put to farmers through the agency of the member bodies of the Canadian Federation of Agriculture. A listing of the questions asked is attached in Appendix A.

Appendix A is the last page of the brief, and it gives you the substance of the questionnaire.

Prices of farm machinery and parts

Farmers are unanimous in their belief that prices of farm machinery equipment, repairs and service are excessive. This belief is in part a direct belief that farm machinery costs are higher than they need be and should be. But as already noted it is in part an expression of the inadequacy of farm income to meet heavy demands for operation, repair and investment.

It is also quite clear from replies received to our questionnaire that the sorest point among farmers is not so much the cost of new machines as the cost of parts and service. In this area it is very clear that farm feelings about repair and replacement costs vary from dismay to outrage. In this connection it should be noted that delays and difficulties in obtaining parts are a very real item of cost to the farmer, not reflected in actual prices. Often this aspect of the problem, because of unsatisfactory experiences, looms very large in the farmer's mind.

There is no doubt, in our opinion, that sales, service and distributive costs for farm machinery and machinery repairs and parts, are higher by a good deal than they should be. The farmer is in the position of having to buy at retail, and sell at wholesale—a difficult one at best. It is therefore of the utmost importance that distribution and sales costs be kept to a minimum. We recognize that there are real problems and difficulties here arising from the wide geographic dispersal of farm business units, but we also think improvement is possible. We would like to quote the following statement by Mr. J. T. Kyle, diector of the Saskatchewan agricultural machinery administration:

One of the very fundamental problems in our opinion is the "horse and buggy" distribution system presently used to distribute farm machinery. In our opinion, a new policy of dealer appointments on the part of farm machinery manufacturers offers significant possibilities for economies in farm machinery costs.

The farm population in Saskatchewan has decreased from over 125,000 farms to well under 100,000 farms. No equivalent reduction has been made with regard to the distribution organization of major farm machinery manufacturers. This is indicated specifically by the fact that there were 1,850 licensed farm implement dealers in the province of Saskatchewan in 1959, a number not significantly different than it was ten years ago. It is a rather interesting observation to relate the relationship of farm implement dealers to the present farm population. Assuming the present population to be even 100,000, which in fact is much more than the actual resident population of farm people, this would indicate that there are about 54 potential farm customers on an average to each farm implement dealer in the province. From a purely economic fact alone, this would seem to indicate that there exists a rather extensive distribution system, and perhaps something in excess of what is economical. The cost of servicing high numbers of farm implement dealers adds significantly to the cost of modern day farm machinery. With these thoughts in mind therefore it would seem reasonable to assume that some of the overhead costs of merchandising farm machinery could be reduced with a reassessment of future policy on the part of machinery manufacturers as they go about their dealer appointment problem.

Coupled with this thought, is the fact that a much higher adequacy of repair stocking could be obtained, since it would then be economical for farm implement dealers to carry significant repair stocks rather than simply duplicating the small fast moving stock that their competitive dealer six miles away is also carrying. An increase in the financial health of the farm implement dealers will give beneficial results to farm users through better stocks of repair parts and more adequate service on a local level.

We are sure much the same statements could be made as related to any part of Canada. We would emphasize that the thinking of the machinery administration in connection with the rationalization of the distributive structure is, as we understand it, that the improvement should be gradual and evolutionary, not sharp and disruptive to the distributive structure.

In the last annual report of Canadian Co-operative Implements Limited it is reported that their sales increased 32 per cent over the previous year, and the increase in savings amounted to \$582,750 and represented about 13 per cent of sales to members. If these savings are calculated on new machinery sales alone, as is often done, the savings amount to 15½ per cent of sales. We do not propose to discuss the experience of C.C.I.L. to any extent, because you will be hearing from them directly in the course of your hearings. We think, however, that figures such as these, and even more the record of C.C.I.L.'s past experience, indicates that rationalization of distribution could mean very large savings to the farmer.

Between 1947 and 1960 the index of farm machinery prices rose from 126.3 to 254.2—a more than 100 per cent increase in 13 years. This index is the one used in calculating the overall index of prices of commodities and services used by farmers. This is a very substantial increase and gives point and urgency to the need for taking all possible action which might reduce the farmer's machinery costs.

The record on costs of parts gives, in our opinion, special cause for concern. Over a period of much less than 13 years, item after item of farm machinery parts have shown increases that do seem out of line with general changes in price levels. We have no doubt that the answer to this problem of high costs of repair and replacement parts lies primarily in better organization of repair and distribution facilities, and in reduction of model changes and standardization of parts. The situation will not be improved, we are certain, simply by objecting to the level of these prices.

We quote below a statement from one of the officials of our organization which illustrates this point:

Having had frequent access to a branch farm machinery warehouse I have seen in the post-war years a terrific amount of new machinery and parts go into scrap. In this period a lot of work was done to develop hydraulic implements. Evidently this company acquired patents from another company with which they became associated and the results of years of research and manufacture were thrown away. I am sure for all of this obsolescence, etc., it is the farmer who pays eventually. A similar condition seems to exist in the wholesale parts department. About the last week of October of this year I have seen tons and tons of both machinery and parts sold to scrap dealers. At one time it almost looked to me as if they disposed of the parts which had been misplaced rather than try to recatalogue them. Only recently an employee of a local dealer told me of seeing a principal part go into the scrap truck and he told shortly after that this part was out of stock and would have to be ordered from the factory. Of course all scrap is cut with a torch so no farmer could make use of it.

We have received from our members many examples of the increases which have taken place in the prices of individual machines and repair parts in recent years.

Below are given some examples we received from Western Canada:

- (1) A 3-plow tractor cost \$1400 in 1943. A comparable model today costs \$4000.00.
- (2) A combine bought in 1953 was \$5500.00. Today a combine which is practically the same costs \$8000.00.
- (3) In 1951 SP combine cost \$5500. A 1960 model is \$7700.
- (4) A swather cost \$600 in 1950 and now costs \$1000.

- (5) A tractor with a horsepower of 30 to 38 in 1939 was priced at \$1750. A comparable horsepower tractor today cost about \$4000. There have been of course improvements in tractor design and productive capacity so the actual increase in price is not as great as it appears.

Some farm machinery has not changed appreciably in design in the past ten years and even here price increases clearly show that technical advances in design cannot begin to account for the price increases which have occurred, a contention which we sometimes hear. Here are some examples which fall into this category:

You will notice that the longest period given is eleven years. However, all the rest are for a shorter period than eleven years.

Type of machine	List prices in years indicated		
	Years	Prices	Increase
		\$	
12 ft. swather.....	1950	545	65
	1960	899	
15 ft. swather.....	1950	625	60
	1960	999	
16 ft. swather.....	1953	816	26
	1960	1,030	
8 ft. oneway disk.....	1949	450	67
	1960	725	
Model WD tractor.....	1953	2,245	19
	1959	2,675	
Side-delivery rake.....	1952	265	48
	1960	363	
Hammer mill.....	1953	263	31
	1960	345	
Cultivator (tool carrier).....	1953	293	30
	1960	380	

The recommendation by several of our members was that changes in the models of machinery are too frequent. Several believe that there should be three to five years between each new model. This, it is claimed, would help to prevent price increases because new models represent significant costs in terms of tooling. Moreover dealers would be able to maintain larger stocks of repairs and parts.

A report from Quebec states that one manufacturer of tractors made 12 models in one year. The next year all but three were changed or dropped.

The following table illustrates changes in prices of parts with no changes in design, taken from Saskatchewan experience:

Type of machine	Part	Listed prices in years indicated		
		Years	Prices	Increase
			\$	%
Combine.....	sprocket.....	1952	4.38	75
		1960	7.69	
	roller.....	1952	15.25	62
		1960	24.78	
Combine.....	guard.....	1952	1.20	54
		1960	1.85	
	pick-up sprocket.....	1950	1.09	23
		1960	1.34	
Power Mower.....	knife head.....	1950	4.10	91
		1960	7.85	
Swather (16 ft).....	knife.....	1950	14.95	144
		1960	36.52	

Other examples received direct from farmers are:

	Years	Prices	Increase
		\$	%
Pulley for combine.....	1951	4.50	311
	1960	18.50	
Canvas for combine.....	1946	5.00	160
	1960	13.00	
Set of plowshares (3).....	1947	14.00	100
	1960	28.00	
Combine distributor cap.....	1957	4.50	155
	1960	11.50	
Combine cylinder chain.....	1954	18.00	66
	1960	30.00	
Mower knife.....	1957	8.50	65
	1960	14.00	
Tractor tire (rear).....	1957	60.00	42
	1960	85.00	

From a Quebec source we received the following comment which was similar to replies from other areas of Canada. "There is a practice of making certain units which are part of an assembly and if one of these units wears out or breaks the farmer has to buy the whole assembly". This remark calls for serious consideration by farm machinery manufacturers.

Here are comments from Manitoba. Weak spots of new machines are not corrected fast enough. Warranty runs out and new parts have to be purchased for the weak spots. A slip clutch for a 1954 combine cracked the hub. This had to be welded constantly. A new one was bought in 1959 at a cost of \$20. It lasted one fall. Two years ago it was necessary for the farmer to wait two weeks for a beater shaft for a combine. Last fall he had to wait six days for a power take-off. A kit was brought out by a tractor company but a bearing could not be bought separately. It was necessary to buy a complete cluster and throw away the old gears. The cost was \$150. It was necessary to buy a new hydraulic pump because the seals for the old ones were not available. The new pump cost \$150.

Competition among dealers

From our questionnaire it is clear that farm people value the existence of a degree of competition in farm machinery sales in their area, and believe it definitely improves their bargaining position. In some districts price competition, starting from listed prices, is quite intense and price cutting frequently occurs. In other areas it is not nearly so keen, while in many other localities it is reported that there is little or no competition in price. In most areas, however, it is the allowances for trade-ins on used machinery which constitutes the principal feature of the competition between farm machinery dealers. In general farm machinery dealers are reported as giving discounts for cash when they do not have to take a used machine as part of the payment for a new one.

It should be emphasized, however, that it should not be necessary, in this age of motorized transportation, to have excessive numbers of dealers, in order to provide healthy competition in the farm machinery business.

In relation to this subject the following statement appears in the 1960 report of the Canadian Co-operative Implements Limited: "It will no doubt be a surprise to many to know that, in the years from 1952 to 1959, we paid member customers approximately \$2,600,000 more for their trades than we were able to sell them for. And it will be a further surprise to know that a total of more than \$750,000 was allowed to customers by way of discounts for cash."

There is one aspect of this matter which deserves mention and that is, where prices have been cut severely, or unrealistic allowances have been made for trade-ins, the margin of profit of the dealer may be so reduced that he is unable to stock adequate repair part inventories, and therefore he cannot properly service the machines which he has sold, and is unable to honour normal and legitimate warranty claims. One example which we received of the allowance for a used machine which illustrates the extremes to which dealers will go to sell a new machine is—one dealer offered \$35 for an old hay rake while another dealer offered \$250 for the same rake.

Quality of machinery and parts

From the replies to our questionnaires no general insistence that the quality of farm machinery and parts is inadequate, or is deteriorating, was found. There were some definite complaints, however, and no doubt real problems exist in this regard. The answer is, we would think, to develop across Canada adequate programs of pre-testing and research. We will be making some definite recommendations on this point.

A number of replies that we received to our questionnaire insisted that there has been a deterioration in the quality of farm machinery. There have been complaints about the poor quality of steel and of certain engineering features. One reply was to the effect that research is necessary to find new materials or alloys to withstand corrosion in fertilizer machinery and attachments. Another farmer stated that when new machinery is obtained it is frequently not ready for operation and many changes and adjustments are necessary before it can be used. Cultivator teeth break too frequently and bailers have weak and sensitive time mechanisms. Plows have weak beams and frogs which are soon out of alignment. Rakes break and bend or fail completely in heavy crops. Chisel plows fail to work at constant depths. Field sprayers with 50 gallon tanks have no quick means of refilling the tanks from a pond or creek.

On many Quebec farms we have been told there is no possibility of using combines to harvest grains and farmers have been informed by dealers that they cannot get reaper-binders as these machines are no longer manufactured. The farmers making this remark suggested that this point should be investigated.

Adequacy of supplies of parts and service

Loss of time in obtaining parts and inadequacy of supplies of repair parts were mentioned by many of the farmers in the various provinces as problems of serious proportions.

There is little doubt that the availability of repair parts to farmers is inadequate at certain times of the year. During the harvest season shortages are apparent both at the vendor and the distributor or branch level, and even at the factory level in some cases. Experience in this regard is of course not uniform—for example there were some farmers in Ontario who replied to our questionnaire stating that the servicing of parts was adequate or reasonably adequate. There is no doubt, however, that a serious problem does exist in this matter of availability of repair parts.

When new models are placed on the market the manufacturers seem to be reluctant to stock adequate repairs for new models of machines even on a branch level until experience indicates what is required. By the time this information is available to the repair parts managers on the branch level there usually exists an extreme shortage in terms of parts for the dealer and the farmer. Long delays are the result of this inadequate planning. The rapid change of models being offered for sale has resulted in a very high rate of obsolescence for repair parts and also means an ever increasing inventory of repair part needs. Different methods are being tried to determine repair stock requirements and to handle repair orders once they are received. This indicates that manufacturers are making attempts to correct the problem, but are a very long way from a solution.

Some observations from Manitoba are worth recording. One farmer has reported that he had to wait all summer for a mower knife. Another farmer needed a sprocket for a 1959 combine. He could not get it from the local dealer and he had to pay for six long distance telephone calls in order to obtain one from another dealer. The same farmer broke a small piece on the knotter of a bailer. The dealer phoned three possible sources for the part required but none were available. He finally obtained a piece from Winnipeg after another long distance call. In another case a farmer was tied up for two weeks because he could not obtain a small pin for a oneway disc. In still another instance a farmer had to wait a week in the middle of harvest for a feeder chain for a combine.

Many similar types of complaints were received from Alberta. Here are examples. A farmer ordered parts for a new seed drill through the local dealer late in January but it was not until the end of March that he was able to obtain parts, that is, some of the parts. The rest were not obtained until the first of June. Another farmer in Alberta stated that on two occasions he had to wait a complete season for repair parts for two machines.

From Quebec province we received the following comments and examples. Within the last two years two companies which manufacture farm implements have closed their warehouses in Ottawa and Montreal, with assurance to farmers that they would continue to give excellent service, that in fact there would be improved service from their warehouses in Toronto and Hamilton. However, the opposite has been the case. Shipments to dealers are made every two weeks, and if anything

is needed in a greater hurry, it involves additional costs of wiring, express and such charges. On top of this, many of these parts for even recent models of machines are out of stock in these warehouses.

A six-year-old tractor was damaged in a farm accident on June 28th, 1960. Parts were ordered for it immediately, but it was out of operation for over three weeks until one key part came. The rest were not available, and the tractor was put back into operation through welding processes. The final shipment of parts arrived late in November. The three week lay-over was in the middle of haying.

A four-year-old tractor was purchased in the first instance without a power-take-off attachment, which was optional. Now the owner wishes to buy one, and is told that they do not make these parts any more.

An eight-year-old manure spreader, with a standard apron chain, which has never changed for some years, was in need of a new chain. It was eight weeks before delivery of the parts.

In recent years, there has been a steady turnover of agents and agencies, and in each case this has resulted in a complete disruption of parts service. Some of the old dealers have passed on, and their families have not been able to renew their service contracts on the old basis. The new contracts have not been as protective to the farmer.

One of the replies to our questionnaire from Prince Edward Island was to the effect that farm machinery manufacturers need to have a change in their practices of supplying parts to their dealers, or need to establish a complete supply center on Prince Edward Island from which parts could be drawn as very often there is too much delay in getting parts from the nearest point in New Brunswick. The farmers of Prince Edward Island have a great deal of money invested in machinery, and parts as well as expert service should be available without delays.

A few farmers reported that repairs for older machines, which they must use because their incomes are not sufficient to buy new ones, are not available in depots and warehouses. There were also complaints that parts for new machines, which frequently have some weaknesses, were not available at local depots when they were required.

Standardization of Machines and Parts

Most of the farmers in all the provinces replying to our questionnaire expressed the opinion that there should be greater standardization of machinery parts. Standardization has been recommended for many years as a significant means of reducing the costs of modern farm machinery. Standardization of the design of machine component parts within any one manufacturer's line of machinery should, especially, yield good results in terms of lowering the cost of production. It appears that no real concerted over-all management effort has been undertaken to standardize component parts within a complete line of machinery. It should be possible, for example, for design engineers to standardize on the use of a much lower number of different bearings for their line of equipment than has heretofore been the case, without loss, or without significant loss, of efficiency. Small declines in efficiency would probably be much more than offset by reduced repair inventory requirements right through from the manufacturing end of the dealers' stocks, to say nothing of the possibility of economies from larger bulk buying.

Standardization of component parts for tractor motors has been undertaken to a limited extent by one manufacturer but this could be developed to a much greater extent. General Motors has provided an example by manufacturing their diesel power plant in a horsepower range from a minimum of 90 horsepower up to 500 horsepower and on a standardized design basis. The

pistons used in the small two cylinder diesel power plant are the identical pistons used in the quad-six cylinder 500 horsepower units. Likewise connecting rods, wrist pins, valves, etc.

Costs could be reduced if all pistons were identical regardless of the number of pistons or the size of the power plant. The same reasoning would apply to connecting rods, connecting rod bearings, wrist pins, rings, valves, valve springs, main bearings, etc. Standardization of items such as ledger plates, knife sections and guards between swathers and combine cutter bars could be established. Reel arms and reel bats could also be standardized between swathers and combines. Among the other parts for which farmers in various parts of Canada recommended standardization are cultivator shovels, belts, batteries, oil filters, plow shares, bolts with standard thread, links for drive chains, rake teeth, pulleys, tubes, tires, wheels, discs for seeders, electrical equipment such as starters and generators, axles, gear shifts, and hydraulic fittings. The manufacture of power take-offs of uniform character which has already occurred was favourably commented upon by several farmers. A Prince Edward Island farmer made the comment that he traded in his 1951 tractor last year and was able to use all of the mounted implements on the new 1959 model. A neighbour who traded in his tractor for one of a different make had to buy all new mounted attachments.

A few farmers stated that they feared that if parts were standardized it might hinder competition and stop further improvements in designs.

The American Society of Agricultural Engineers has carried on a program of standardization for the manufacture of component parts of farm machinery. These standards are not binding on any manufacturer but are being widely used by American and Canadian companies wherever they are applicable. That is, Canadian engineers are also part of this American Society of Engineers. Those standards relate to such things as power-take-off speed and adapters, belt pulley speed and adapters, three-point linkage, cultivator sweep and shovel mountings, hydraulic remote control rams, etc.

Credit Facilities

There was fairly general agreement that credit facilities are adequate for the purchase of farm machines. Many farmers remarked that they were glad to be able to obtain federal farm improvement loans on which interest was at a lower rate than if they used the credit facilities of the farm machinery companies. A few stated that the interest rate on these Farm Improvement Loans should be lower and more in line with the prices they were receiving from the sales of their farm products. Others who used farm machinery company credits stated that these charges were much too high.

Distances to repair depots

Farmers in Canada in general have to travel from 5 to 30 miles for repair parts—seldom more than 30. With improved highways these distances are not considered a serious problem for most farmers provided the repair depots have the parts in stock which the farmer wants. There were a number of farmers who recommended fewer but more adequate repair depots.

Rationalization of dealer and repair depot system

The increased costs of new machinery has been a real concern to farmers in every province of Canada. A remodeling of distribution of farm machinery by major manufacturers offers possibilities for significant economies in farm machinery cost. In many areas dealer organization has not been changed very much in recent years. Modern means of transportation have improved considerably and farmer buying habits indicate that ever increasing numbers are going to larger trading centers to purchase goods required. At the same time farm population has decreased substantially, but equivalent reduction has not been made in the distribution organization of farm machinery manufacturers. The costs of servicing large numbers of farm implement dealers adds significantly to the costs of modern day farm machinery. Many farm implement dealers have found themselves in financial difficulties. It would seem reasonable therefore to think that some of the overhead costs of merchandizing farm machinery could be reduced with a realignment of the dealer distribution pattern.

Progress is being made in the improvement of farm implement dealers' operations in Saskatchewan by the licensing program of the agricultural machinery administration. The adequacy of dealers in respect to the supply of repair parts and service to farm customers is given serious consideration before licences are granted. When an application is received for a new licence to merchandize farm machinery the applicant is required to meet a minimum set of standards in relation to repair parts and service facilities commensurate with the type of equipment the new dealer intends to sell. The administration is attempting to work with manufacturers of implements to establish a much higher level of dealer adequacy than has heretofore been acceptable to most manufacturers. This should in time bring more order into the distribution of farm machinery in Saskatchewan. The principal manufacturers appear to be leaning quite definitely towards the appointment only of establishments capable of providing first class service to farm customers as well as possessing good possibilities of long time operation in this most competitive field. The fact that manufacturers are required to register with the agricultural machinery administration their intent in making new dealer appointments has contributed to the adequacy of farm implement dealers as this requirement encourages co-operation between the administration and the machinery companies.

Machinery testing stations

There was widespread belief that governmental or other institutional type stations should be established to test all farm machinery in every province before it is offered to the public. In addition to the testing of the machines and of the efficiency of their operation, the administrators of the station should be given authority to require that dealers have adequate stocks of repair parts and services available for the farm machinery they sell to the farmers in the provinces which these stations serve. Several farmers referred in a most commendatory manner to the Saskatchewan agricultural machinery administration which is now in active operation. Testing of farm machinery in Saskatchewan has had a significant effect in the improvement of the types of machines offered to farmers in that province. These tests have been of value to farm implement manufacturers and have resulted in substantial savings to farmers by helping them in their selection of machines best suited to the work they wish to have done.

Farmer self-help

There are three or four areas of opportunity for improved conditions through farmer self-help by their individual or collective efforts. In each of these there is little doubt that education and promotion programs can make a real contribution, especially if these are combined with programs of government research, improved legislation and industry cooperation.

First is the vexing question of cooperative or partnership arrangements in the ownership and operation of farm machinery, and, closely related to this, the best use of the possibilities of placing reliance on custom work. The difficulties in the way of joint use of machinery by farmers are undoubtedly great, and the reasons why more farmers do not enter into such arrangements carry a great deal of weight. Nevertheless, this is an area in which we are convinced that real progress is possible and necessary. This is not something that parliament can legislate, but it might very well be something to which through its research programs and in other ways parliament could give attention in the interests of the promotion of joint use.

There is at present relatively little cooperation among farmers in the purchase and use of farm machinery and equipment except among family relatives. A few farmers who are not members of the same family do buy some of the higher priced implements collectively. Many farmers believe that their costs of operation could be reduced by more cooperative purchasing of machinery. A few replies from farmers in Ontario said that cooperative purchasing and use was increasing. The reasons given for lack of machinery partnerships were that due to weather conditions the machines owned cooperatively are frequently needed by each of the farmers at the same time. It was also stated that some farmers take good care of machinery while others do not and that often neighbouring farmers have rough and stoney land which causes breakages in the implements. There is a considerable amount of custom work in some areas. Often too, farmers rent more specialized machinery to their neighbours.

A study made by the Canada Department of Agriculture showed that in south central Manitoba in 1955 about 85 per cent of the farmers owned combines and 25 per cent of these combines were owned in partnership. About 87 per cent of the farmers owned swathers of which about 19 per cent were owned in partnership. A survey in the Waskade soils area in the same year showed that about 89 per cent of the farmers owned combines and 15 per cent of these were owned in partnership. About 87 per cent of the farmers owned swathers, 12 per cent being owned in partnership. In 1955 about 10 per cent of the crop acreage in these areas were swathed and combined by custom operators.

The second self-help area is in the cooperative manufacturing and supply of farm machinery. Throughout our questionnaire replies there were many farmers who referred to the operation of Canadian Co-operative Implements Limited and recommended that many more farmers should give their full support to this organization, and that it should have a wider coverage and become more involved in manufacturing. C.C.I.L. is not the only example of cooperative activity in the farm machinery field in Canada, although it is

probably the major one. Co-operative Federée de Quebec is also extensively in the business of selling farm machinery, to mention what is probably the other major operation.

The objective of C.C.I.L. in the beginning, was to sharply reduce costs of purchasing farm machinery by slashing unnecessary selling costs. We believe that this is still a valid objective, and given sufficient producer support could be accomplished. But the task has not proved an easy one. We expect that you will be hearing representations from C.C.I.L. and the Co-operative Union of Canada, and we will content ourselves in this submission to registering as strongly as we can our belief that in cooperative self-help there remains a major area for farmer gains as far as farm machinery costs are concerned.

The third area, that of individual self-help, was mentioned in a number of connections by producers replying to our questionnaire. In particular the following suggestions were made by farmers to us:

1. That pre-season check-up and repair of farm machinery by farmers would considerably ease the danger of getting caught in peak-season breakdown and repair problems.

2. That there is room for more education and information for farmers concerning the care, operation and maintenance of their machinery. The need for increased opportunities for instruction in the use of the more complicated forms of machinery was mentioned in this connection.

RECOMMENDATIONS

The farm machinery question has been a subject of many inquiries in the past, but there has been little agreement on what action should be taken to lower costs and correct difficulties experienced by farmers. However, we believe there are some things which can be done to make a contribution in this direction. Doing them will involve the cooperation of governments, of machinery companies and of farmers themselves.

The recommendations which follow will, we hope, make some contribution to this enquiry.

I—Price maintenance and monopolistic control

A 1957 memorandum prepared for a special conference by Canadian Co-operative Implements Limited stated: "The year 1953 marked the end of a period, a period of about half a century of iron-clad agreement on prices between the machine companies culminating in eight years of phenomenal sales and profits for the companies and big savings for C.C.I.L.". This statement is interesting on two counts: The first being that it indicates that over a long period the degree of actual price competition in the sale of farm machinery was very limited. The second being that after 1953 a change took place in this situation in face of a severe drop in farm machinery sales, particularly in Western Canada. There is no doubt that over a long period of years farmers have felt that inadequate price competition existed in the field. Perhaps there is little or no problem in this respect today. However, in order to find out and get the picture clear,

We recommend:

That the matter is of sufficient importance that competitive conditions in the industry might well be investigated under the Combines Act. Section 42 of the act provides for the carrying out of enquiries "concerning the existence or effect of conditions or practices having relation to any commodity which may be the subject of trade or commerce and which conditions or practices are related to monopolistic situations or restraint of trade."

II—Costs of distribution, sale and repair of farm machinery

It is the belief of the Canadian Federation of Agriculture that costs of distribution, sale and repair of farm machinery are unduly high. We do not necessarily claim that excessive profits are made by dealers in farm machinery and parts. This may be so in some cases, but we are more inclined to think that the trouble lies in the excessive costs involved under present conditions.

We recommend:

That in the interests of constructive thinking and action in this field the government of Canada should order an expert inquiry into the whole business of the distribution of machinery and parts from factory to farmer, and into repair business. The purpose should be to determine the exact nature of the distributive costs involved in the farm machinery business, and the savings that might be realized, without loss of efficiency and necessary service, by its more rational organization. We would emphasize that what we are requesting here is an expert enquiry, somewhat along the lines of technical management and cost studies. We think this could be done and that it would be of very great benefit and usefulness.

III—Standardization

The Canadian Federation of Agriculture attaches very great importance to the need for taking all possible steps to achieve: (1) greater standardization of farm machinery parts, and (2) a correction of what our people believe is an altogether excessive tendency to put new models on the market at frequent intervals, and to have too many different models in lines of farm machinery. In discussing this question we recognize that we are talking about a North American, and not just a Canadian, situation. It may very well be that in implementing our recommendations in this connection it would be necessary to undertake a substantial degree of international consultation.

We recommend:

(a) That this committee explore ways and means and make recommendations for a thorough study to be made (perhaps by the standards branch of Trade and Commerce, or by the national research council) into the extent to which component parts of machinery and equipment used by farmers could be made uniform so that they would be interchangeable between different models, different machines and different manufacturers. This study should also examine the degree to which there could usefully be standardization of parts within lines of machinery. Finally, it should examine the degree to which there may be a needless degree of proliferation of models, and explore the economic implications of this.

(b) That such a study having been made (or prior to its being made) that a formal advisory committee of farmer representatives, farm machinery manufacturers and representatives of government be established to give continuing attention to the problem of standardization and simplification in farm machinery parts and manufacture generally.

IV—Testing and research service

The establishment of testing stations or organizations, of which the Saskatchewan agricultural machinery administration is an example, would be of great value to farmers in every province. One station might be set up to service the Atlantic provinces, one for each of Ontario and Quebec, another in the prairie provinces besides the one now in operation in Saskatchewan, and one in British Columbia. These stations would provide detailed performance testing and inspection of machinery and repair parts for farmers. They could also help farmers to become more efficient by giving them advice on the types of machinery and equipment best suited to the soils and topography of their farms, the kinds of crops they grow and other characteristics of their farming operations. Administrators of these test stations could also keep a watchful eye on the adequacy of the stocks of repair parts available and of the services required by the farmers in the areas they serve. These testing stations could be financed and operated by provincial governments and to avoid duplication in their testing operations there would need to be continuous consultation and co-operation between the administrators of the various stations in the different regions of Canada.

There are also certain areas of research and testing in farm machinery that need not be directly related to the farming conditions in particular areas. In such cases universities and agricultural colleges may be the best place to get the work done. We understand such work could be usefully expanded.

We recommend:

That the Federal government assist substantially in financing a Federal-Provincial program of farm machinery testing across Canada, and an adequate research program into farm machinery requirements. To avoid duplication of work this whole program should be carried out on a co-ordinated basis, and the greatest possible care should be given to ensuring that (i) pretesting of farm machinery is carried on to ensure that machinery is not put on the market until reasonable assurance that it is adequate for the job is obtained, and (ii) results of test on farm machinery sold, and evaluation of them in terms farmers can use and understand, be given wide distribution and publicity.

V—Farm machinery administrations

We recommend:

An extension not only of testing and information programs for farmers, but of farm machinery administrations in each province which can work with machinery companies (and co-operate between themselves) to develop improved patterns of dealerships, and repair and parts services. Strict legal requirements regarding the availability of parts, and a system of licensing of dealers in the interests of long-term improvement in the distribution structure, should be established as part of the work of a Farm Machinery Administration in each province.

VI—Grade standards for rubber tires

We recommend:

The establishment of grade standards for rubber tires. This recommendation has importance extending beyond the farm machinery field. It is of particular relevance to automobiles and trucks, since here there are important considerations not only of equality, but of public safety involved.

This brief is respectfully submitted by the Canadian Federation of Agriculture.

APPENDIX "A"

*Questions Asked In Canadian Federation of Agriculture Questionnaire
On Farm Machinery Prices, Repairs and Services*

1. What are the problems and difficulties being experienced by farmers in your area on supply and price of agricultural machinery, implements and equipment? Comments might include:

- (A) Price competition between dealers representing different manufacturers.
- (B) Changes in prices of machinery parts and services over a period of years.
- (C) How satisfactory is the quality and suitability of farm machinery available to producers?
- (D) How do the prices being received for farm products affect the purchase of modern farm machinery?
- (E) To what extent are producers cooperating in the purchase and use of farm machinery equipment?
- (F) How adequate are credit facilities, and what problems arise?
- (G) Other aspects of this question.

2. What problems and difficulties are being experienced by producers in respect to the obtaining of parts and the servicing of repairs to farm machinery and equipment? Comments might include:

- (A) Is the service of parts and repairs adequate?
- (B) Are prices of parts and repairs reasonable?
- (C) How far on the average must farmers go to obtain parts and repairs?
- (D) Other aspects of this question.

3. Standardization of farm machinery and parts has been widely recommended. In what respects do you think this is desirable and possible? What problems do you encounter?

4. What solutions can you offer to the problems of producers with respect to farm machinery prices and equipment, the supply and servicing of parts and repairs and the efforts of farmers to purchase more efficient farm machinery and equipment?

(NOTE: If in your area there are separate producers such as grain, dairy products, beef, hogs, poultry, fruits, vegetables, canning crops, tobacco, etc., as well as general farmers, or those producing a number of different products, it would be useful in analyzing the results of this survey if you would classify your answers by the different types of farm enterprises. Experiences from individual producers would be useful.)

In the discussion of this brief I would appreciate it if we could have Dr. Hopper and Mr. Kirk join in the discussion.

The CHAIRMAN: Thank you very much, Dr. Hannam. I was just wondering if Dr. Hopper or Mr. Kirk had any statements they wished to make before we throw the meeting open for discussion?

Mr. THOMAS: Is it the intention to include this complete brief in the report of the proceedings for this morning?

The CHAIRMAN: Yes, Mr. Thomas.

Mr. THOMAS: If so, I suggest it be included in its entirety, that is, not only the text you have read but also the explanatory statement you made in the course of the reading.

The CHAIRMAN: It will be included in the proceedings.

Mr. DANFORTH: In the presentation of this brief—perhaps I am wrong—I have come to the conclusion that one very great area has been avoided by the federation of agriculture. I would like to know about this.

It is my impression that in this brief the federation has strayed away from anything dealing with the manufacturers themselves. There has been no suggestion on the part of the brief that any inquiry or research be taken into the matter of, perhaps, excessive profit on the part of the manufacturers of farm machinery. There has been no assertion that the companies be asked to undertake a greater part in the testing of their machines.

I submit that there has been no suggestion that the companies should combine to set up their own testing situation for farmers. In no way, does it seem to me, has the federation put any onus on the manufacturers of machinery, where initial costs are increased.

I wondered if it was stipulated that they should stay out of this field, or if they did it for some definite reason. It seems to me that this is the very organization which should be asking that something be done to determine why the initial cost of machinery and repairs should be increased to such an extent.

The CHAIRMAN: Perhaps Dr. Hopper would care to reply?

Dr. W. C. HOPPER (*Economist, Canadian Federation of Agriculture*): You must remember, sir, that 82 per cent of the machinery used by our farmers represents imports, and that of the production in Canada 76 per cent is exported. That is one of the reasons we mention that this is a North American problem, and should result in consultation between our governments, that is, between the United States and Canada.

Mr. DANFORTH: I submit there is nothing contrary in your brief. You do not even ask that we investigate this field. That is what concerns me.

Mr. DAVID KIRK (*Secretary, Canadian Federation of Agriculture*): There are two or three points here. In the first place we have a recommendation that under the combines legislation a very careful inquiry be made into the situation.

Mr. DANFORTH: That is concerned with price fixing.

Mr. KIRK: That is right, into the circumstances of price fixing; but that is relative to the manufacturers. The manufacturers are also the ones who determine the form of the distribution, as it were. You are quite right. We feel that as a practical matter it is within the field of distribution costs that we are most likely in fact to make real improvement, and in standardization. We are asking for co-operation, in three or four respects, of the companies there.

In the testing field we are inclined to think that what you need is a public testing program, that is, one that is publicly carried on in the interests of farmers.

Now, on the question of why we did not deal more extensively with the possibility of excessive profits on the part of farm machinery companies, let me say this—

Mr. DANFORTH: And would you include a generalization as to why you did not include the excessive profits of the companies themselves as well as of the distributors? Could you tie the two in together?

Mr. KIRK: I think that we have no evidence. Perhaps this is just due to lack of adequate research on our part. Perhaps the committee would be able to determine this situation from the manufacturers. But we have no evidence before us that would be adequate, in our opinion, to make a confident statement as to excessive profits earned by the farm machinery company. Consequently, we did not make such a statement.

We certainly could agree with you that this is a very proper matter for inquiry, and we hope that the committee will satisfy itself on the position in this regard. But we did not have this evidence, and that is the principal reason.

We were not able to establish statistically that farm machinery prices have increased very greatly having regard to the increase in comparable things, or having regard to the increase in the price structure. There are many price indices that have gone up less than those for farm equipment—those for fertilizers, for petroleum and for textiles. In the fields that are more directly comparable in price indices in the iron and steel products field, we are not satisfied completely that we could present evidence to this committee that farm machinery has a unique position in the price field, in the sense of having achieved a much greater level of price increases than in other fields.

Mr. ARGUE: Surely that is not the point. You are throwing in the towel in regard to looking at manufacturers' profits, if you say that they are no worse than the rest of the gang in the field. That is not what we are looking at. The members of the committee feel—and that is the reason for the committee—that farm machinery prices are excessive, and that there is reason to look at them.

Mr. DANFORTH: Can we conclude that it is the premise of the Canadian Federation of Agriculture that as we see them the drastic increases to farmers follow on two main lines—the cost of distribution and the lack of standardization? Is that the basic reasoning behind the brief of the Canadian Federation of Agriculture?

Dr. HANNAM: We do not feel that we have the kind of technical staff that could go in and enable us to make a charge against the cost of manufacturing machines. The only body that we did have a right to go to and get information from was the Canadian Co-operative Implements in Winnipeg, which we did. I do not want to say what their presentation will be. The result of our discussion with them bears out the presentation we have made here in the brief. We just have not made any charges against the farm implement companies because we were not in a position to substantiate them. On the other hand we did not make any statement to clear them of all blame.

Mr. DANFORTH: Perhaps to facilitate your position, could I get it another way? In the questionnaire sent out to farmers, were they in any way asked to give an opinion or to express any principle at all that they felt the companies were making excessive profits, or that distributors were making excessive profits? Did you, in your questionnaire, ask for an expression of opinion of farmers in this particular field?

Dr. HOPPER: On page 6 there is a statement on prices of farm machinery:

Farmers are unanimous in their belief that prices of farm machinery equipment, repairs and service are excessive.

This was one of the answers we got. They said they believed they are excessive.

Mr. ARGUE: But you are not sure?

Dr. HOPPER: We do not have the research facilities to go out and determine to what extent.

Dr. HANNAM: We did not ask them did they believe the cost of manufacture alone was excessive.

Dr. HOPPER: We did not ask them.

Mr. DANFORTH: I am trying to find out why the federation quitted. I appreciate that the federation cannot go into an inquiry such as this. We feel that that is where we come in, that it is our job to do that. I am surprised that

the federation did not ask that we do this. That is my concern, why the federation did not ask about what would be a vital part in the price of farm implements. That is why I asked if there was any definite reason why this was not done.

Mr. KIRK: The reason is not at all that we did not want such a thing examined. The examination of such a question involves the whole structure of our industrial system. It involves, for example, the price of steel in a very important way and all the questions arising in connection with a rise in steel prices—and many people think that these have been excessive. We felt, perhaps wrongly, that we would not go into this area, that we would concentrate on those areas, we thought, within the terms of reference of our authority from our member bodies, we could make recommendations with regard to economic policy. We decided to restrict ourselves to recommendations where we could concretely suggest things that would be of real monetary value. If this committee can tackle this other thing, there is nothing our people would like better; and perhaps, as you say, we should have made this suggestion to the committee.

Mr. DANFORTH: Is it your feeling this morning, for the record, that the federation feels this field should be gone into?

Dr. HANNAM: Oh yes. We just felt we were not qualified to go into it, but we certainly would be very happy if the committee here would decide they should do so. We asked for an expert inquiry into competitive costs from the standpoint of price competition. That could apply to the manufacturer. We would be very happy to have that apply to manufacturing as well.

Mr. NASSERDEN: Do you not cover it on page 24 when you say:

A 1957 memorandum prepared for a special conference by Canadian Co-operative Implements Limited stated: "The year 1953 marked the end of a period of about half a century of iron-clad agreement on prices between the machine companies culminating in eight years of phenomenal sales and profits for the companies and big savings for C.C.I.L.". This statement is interesting on two counts: The first being that it indicates that over a long period the degree of actual price competition in the sale of farm machinery was very limited. The second being that after 1953 a change took place in this situation in face of a severe drop in farm machinery sales, particularly in Western Canada. There is no doubt that over a long period of years farmers have felt that inadequate price competition existed in the field. Perhaps there is little or no problem in this respect today.

Mr. FORBES: Were price controls effective up to 1953?

Dr. HANNAM: Wartime controls were not in effect up to that time.

Mr. FORBES: In what year were they discontinued?

Dr. HANNAM: About 1947, I think.

Mr. MUIR (*Lisgar*): In the discussion with C.C.I.L., prior to presenting this brief, did you get any relative costs of replacement parts compared to what the cost of parts in the new machines would be? In the brief you mention that the cost of parts particularly is excessive.

Dr. HANNAM: Yes.

Mr. MUIR (*Lisgar*): Then do you have any relative figure to show that the replacement part is costing more than the machine company places on the original part?

Dr. HANNAM: In the answers to the questionnaire there is a lot of evidence which is given in the single-spaced paragraphs, to this effect.

Mr. MILLIGAN: I, like Mr. Danforth, was a bit concerned. I did not feel we could use most of this brief as a basis for questions. Had you gone into the price of steel in 1953 in comparison with 1960? Would it be possible to make a comparison on the increase?

Dr. HANNAM: We did not make that analysis although we did get the distinct impression from the C.C.I.L. that the price of steel was a major factor in the cost of farm machinery, that is, the rising price of steel. This, I think, was made clear to us by the manager or president of C.C.I.L.

Mr. ARGUE: It has already been said that one of the important points in the brief was the opinion that the distribution costs could be reduced. I am wondering if you could tell us the percentage of the retail price that distribution costs now constitute. What is the dealer's mark-up? How much does the dealer get? Right through this brief there seems to be an opinion that the dealers are getting too much—or conversely that you could have fewer dealers and then you could make savings in that field. If this is the place where the big savings are to be made, what is the cost to him, what are the dealers' mark-ups?

Mr. KIRK: We have no data on that, unfortunately. You will recollect that in the brief we took the wholesale prices in an attempt to estimate at the farm level what the total expenditure on machinery and parts was. We increased the wholesale prices to get at the retail figure and the figure we used was 25 per cent which we considered to be the minimum margin from the wholesaler to the farm—the retail margin.

Mr. ARGUE: That is the retail dealers' margin?

Mr. KIRK: Yes.

Mr. ARGUE: My guess is that that would be a little high. In the 1930's the dealer's mark-up was 15 per cent. Probably it has been increased since then. I would doubt very much that the margin at which a dealer operates is 25 per cent—it is more likely to be between 15 and 20 per cent. I wonder if you have any information on the profits that dealers make; never mind the mark-up. I think the farmers realize that the dealers pay more than the trade-ins are worth. Very often I think the dealer is in as bad a position as the farmer. I think there is a tremendous amount of pressure put on the dealer by the manufacturer to buy spare parts, to buy combines, tractors and so on. He is loaded down by the company, and under tremendous pressure. He appears to have a big margin, but, I suggest to you and I would like your information on this, that the dealer is making a very significant profit. If he is making a living, he is doing very well in most instances. I would like your comments on that. What I think you have done is to single out the little guy. You made a frontal attack on him, and you have the wrong person altogether. I could not agree more with Mr. Danforth.

Dr. HANNAM: I do not know where the sentence is now, but we said we were not accusing dealers of making excessive profits. We said that they might, in some cases.

Mr. ARGUE: If you wiped out 50 per cent of the dealers overnight and started out tomorrow with half the dealers, how would you make a saving? How would this help the farmer?

Mr. NASSERDEN: That is a question we should ask the machine companies.

Mr. ARGUE: Since the main contention of this brief is that distribution costs are too high, you have too many dealers, I wish to know, if you wiped out half of them tomorrow, what your saving would be? My guess is you would not save anything.

Mr. FORBES: I would say that you would save 50 per cent of the dealer's mark-up, because he would make the profit on the volume of his turnover.

Mr. ARGUE: That is the manufacturer's concession because of turnover.

Mr. FORBES: You are concerned with the dealer.

Mr. ARGUE: I am concerned about the percentage of profit. If you have twice the volume, you will have twice the profit.

You talk in here also about the dealers being five miles apart. I do not see this at all. Certainly there are some dealers who live five miles from some other dealers, but my impression is—and you have the statistics—that the companies are gradually cutting down their dealerships. There may be an increase in companies but I can think, in my own locality, of a great many small towns where there are no dealers, where a few years ago there were dealers. I would say you have a situation where in a given company there is something like 25 miles between dealerships, rather than five miles although, because of the multiplicity of companies, you may have five miles between some dealers of different companies.

Dr. HANNAM: Mr. Chairman and Mr. Argue, we gave you figures, and they were from your own government in Saskatchewan, saying that the number of dealers is the same as ten years ago.

Mr. ARGUE: And more companies.

Dr. HANNAM: This is the only figure we have.

Mr. ARGUE: My impression is that the number is down, but I am subject to correction. This is no statistic, it is no research, it is just my knowledge that as the small towns get smaller, and the dealers fold up, very often they are not replaced.

The CHAIRMAN: Can I ask you a question, Dr. Hannam? On page 7 there is a statement by Mr. J. T. Kyle. He mentioned that in 1959 the dealership was 1,850. Have you the figures available for ten years ago?

Dr. HANNAM: He said here himself: "a number not significantly different than it was ten years ago".

The CHAIRMAN: Have you the exact figures?

Dr. HANNAM: No, he did not give us the figures.

Mr. MILLIGAN: As far as dealers are concerned, you have a figure for Ontario. I doubt if we have dealers within 25 miles with a particular make of machine. Any place I know runs at least 25 to 30 miles.

Mr. HORNER (*Acadia*): My question deals with page 11. Dr. Hannam stated the increases in prices of various machines—and I think that this is pretty good, to have these machines listed and the exact prices of such and such a machine, and the increases—but the problem we are confronted with is why the increase, why this 65 per cent increase on a 12-foot swather from 1950 to 1960? Why is there a 311 per cent increase on pulleys for a combine from 1951 to 1960? They have stated that these increases could be reduced by a greater speeding up of dealer handlings, more efficiency in dealer handlings, greater testing, greater standardization and larger stocks of repair parts kept at branch offices. I wonder why, however, the percentages that dealers are making, or that the dealers are taking, in order to cover their costs, have increased, say, on a 12-foot swather, to 65 per cent? Where is the 65 per cent increase? What percentage of that increase do you attribute to dealer handlings or testing or standardization or repairs in branch offices? This is something that we, as a committee, should try to locate.

Dr. HANNAM: I would agree, but I do not see how we could do that. You would have to have special technically efficient men to go into that type of thing, would you not?

Mr. HORNER (*Acadia*): You suggested to the committee that the estimated dealer percentage is 25 per cent. Do you consider that this percentage has been on an increase since 1950?

Dr. HANNAM: We said we believe there was more competition in price, that is, the men selling machines to farmers were competing in price, and one man was lowering his price in order to meet competition with the other one, or giving more on trade-ins.

Mr. HORNER (*Acadia*): This is true, but would this greater competition not have a tendency to lower the margin that the dealer would take home, and therefore, in taking this 12-foot swather, the percentage of this 65 per cent increase going to the dealer would be relatively small. The major part of the increase is somewhere else.

Dr. HANNAM: We really did not say that the dealer was getting 65 per cent.

Mr. HORNER (*Acadia*): I am trying to find out what part of that 65 per cent you thought the dealer was getting?

Dr. HANNAM: We do not know.

Mr. HORNER (*Acadia*): I have another particular point that I think the brief could have perhaps dealt with, or the questionnaire to the farmers could have included, and that is, as a practical farmer, I have bought machines, have taken them for repairs and found that there was a choice. I could buy three different cutting knives to fit three different mowers. Why the company want three different knives to save the mower is beyond me. One cutting bar was made in England and the other in Detroit, and so they sell them. It was a heyday for the dealer. He had to stock both cutting bars. I think the companies themselves should bring about greater standardization. This is not mentioned to any extent. You mentioned standardization on an over-all basis, but no standardization to any great extent within a machine.

Dr. HANNAM: Yes, we did say that there was room for standardization within lines of machinery, that is, within the one company. We certainly intended that it should be there.

Mr. HORNER (*Acadia*): I may have interpreted it otherwise.

Mr. MILLIGAN: Are these list prices or retail prices on these machines?

Dr. HOPPER: I presume they are retail prices.

Mr. PHILLIPS: I would like to direct a question to Dr. Hannam. At page 25 of the brief you say:

We would emphasize that what we are requesting here is an expert inquiry, somewhat along the lines of technical management and cost studies.

I am wondering what type of expert you had in mind to investigate the experts which are maintained by the companies.

Dr. HANNAM: Do you not think this is an answer to the question Mr. Danforth asked; that is, why did we not ask that this be investigated. Certainly major companies are going to operate in such a way that they will get the maximum profit if they can, if things can be done to provide farm machinery to dealers and farmers at a low cost without sacrificing efficiency or quality in the product, it should be done. I think often there are benefits which can be obtained by some public supervision of these things.

Mr. PHILLIPS: Then I take it your recommendation does not refer to complete organization or anything of that nature, but rather to costs.

Mr. KIRK: That is right. The reason we mentioned management and cost studies was to indicate the nature of the information we want. In this case we were not speaking of the company; we were speaking of the distributive system. I think that probably the companies do not maintain a full costing procedure including the costs of the business conducted by independent dealers. That would come into the study.

Mr. MONTGOMERY: My question is supplementary to Mr. Horner's questions. On page 11 the increases mentioned there are shown in percentages. I take it that this would start right back at the mine. There is the labour, the cost and the machinery used. It goes right on down to the farmer and includes freight rates and capital costs. In order to find out what percentage the dealer, the railways, and labour get, we would have to go into this in very great detail. Is that right?

Mr. KIRK: That is why we did not feel we could make positive statements in respect of that.

Mr. MONTGOMERY: I understand that. It seems to me that in order to find out where the cause of the increase is somebody has to go into this in very great detail.

Mr. KIRK: Yes.

Mr. CLERMONT: No doubt your questionnaires have been sent out throughout Canada. There would be some sent to the province of Quebec.

Mr. KIRK: Yes.

Mr. CLERMONT: I note that you have made no comparison between 1951-52 dairy product prices and today's prices. Have you any idea how many of these questionnaires were sent to the Canadian farmers? Would the number be 2,000 or 25,000?

Dr. HOPPER: In some cases the replies came in in a condensed form. Some of the organizations condensed the replies and sent them in. That was true in the province of Quebec.

Mr. CLERMONT: Would that apply in the case of L'Union Catholique?

Dr. HOPPER: Yes.

Mr. CLERMONT: Did they make any suggestions in respect of the prices for dairy equipment?

Dr. HOPPER: Not particularly; they did not specify this.

Mr. MUIR (*Lisgar*): Further to my previous question, I note from the questionnaires to farmers that the farmers thought repair parts were excessively high. In your discussions with the C.C.I.L. were you given any reason why a replacement part should cost 50 per cent more than the original part on the machine? Did they indicate that from their experience they believed it was necessary that the mark-up on the replacement parts should be excessively high?

Dr. HANNAM: I cannot recall that, but we would not have thought of including it in our brief in any event, because they know much more about it and are planning to make a presentation to you.

Mr. SOUTHAM: Mr. Chairman, we are basing this inquiry into the price of farm machinery on a widespread demand on the part of the public for pertinent facts. The interest in Canada is indicated by a summary which I have received from the national farm radio forum which made a radio inquiry across Canada. This forum has summed up its information in a summary under date of March 6, 1961. Their topic is "profit or loss with machinery". They have condensed 284 reports from groups with a total attendance of 3,237. In this summary they asked a number of pertinent questions and obtained intelligent comments from these people right across Canada. I wonder

if I might have the permission of the committee to incorporate this into our minutes of proceedings and evidence so that it may be used when we are studying the other briefs.

Agreed.

(See Appendix.)

Dr. HANNAM: We greatly appreciate that. It is something we might have done ourselves.

Mr. SOUTHAM: I think it will be very effective.

Mr. REGNIER: On page 28 of the brief there is a reference to "strict legal requirements regarding the availability of parts". I believe most provinces have statutes regarding farm machinery parts. Would you say that these statutes are inadequate, or have you studied the different statutes in all the provinces?

Dr. HANNAM: No; not in respect of all provinces.

Dr. HOPPER: Only two provinces require that parts be maintained for a period of ten years.

Mr. REGNIER: Should there be a request made to the different provincial governments to institute such laws and to have these laws co-ordinated so that they would all be alike?

Dr. HOPPER: I think it would be very useful if the provinces did require that the farm machinery manufacturers maintain parts for ten years. Only two provinces, Alberta and Saskatchewan, have this requirement now.

Mr. REGNIER: I know they have it in Manitoba.

Mr. FORBES: I think on the contract for sale the company commits itself to supply parts for ten years. I have one here. I do not have my glasses with me, but Mr. Pascoe is looking it over.

Mr. PASCOE: Would you like this on the record? I will read it:

3. The vendor warrants that all necessary repairs for the machinery other than standard bolts and nuts or straps, or other iron or wooden parts usually made by blacksmiths or carpenters, will, for a period of ten years from the date of this order, be kept at Winnipeg in Manitoba or at Brandon in Manitoba, and that at that place the purchaser will be able to obtain them within reasonable time.

The CHAIRMAN: This would be the proper time to adjourn. The committee will meet again this afternoon at 2.30.

AFTERNOON SITTING

FRIDAY, April 14, 1961

THE CHAIRMAN: Gentlemen, we have a quorum. Before we commence our afternoon proceedings, I am going to ask Mr. Lyons, our clerk, to read a telegram which he has received from the Alberta wheat pool.

The CLERK: Mr. Chairman, this is a telegram in regard to an error in the brief which you received in the mail this morning. The telegram reads as follows:

Regret error in chart 11, page 9, of Alberta wheat pool farm machinery brief. Retail prices index should be 126.5 for 1959 and 128.0 for 1960.

J. W. Madill, Alberta Wheat Pool, Calgary, Alta.

The CHAIRMAN: The members may wish to make that correction in the brief they received this morning.

During the luncheon recess the Canadian Federation of Agriculture prepared a supplementary comment in connection with discussions that took place this morning. I am going to ask Dr. Hannam to read this into the record at this time.

Dr. HANNAM:

Supplementary comment by the Canadian federation of agriculture to the House of Commons committee on agricultural and colonization (farm machinery)

April 14, 1961

We would like to make a brief statement in reply to a statement of Mr. Argue that our presentation singles out the "little man" to attack and leaves major economic interests alone. The point was of course raised in another form by other members of the committee, especially by Mr. Danforth. We do not at all agree that we have singled out the little man or left the farm machinery companies out of the picture.

In the first place, with respect to our observations on the distributive system, we would point out that the nature and functioning of the distributive system is determined by manufacturer policy, essentially, and our criticisms of the system are essentially criticisms of the manufacturers. We did not make the claim that the problem lies in excessive earnings by dealers, in fact we said that we did not think this was so, but rather that the overall cost of the distributive system is too high, which is quite a different thing. Our submission stated (p. 25):

It is the belief of the Canadian Federation of Agriculture that costs of distribution, sale and repair of farm machinery are unduly high. We do not necessarily claim that excessive profits are made by dealers in farm machinery and parts. This may be so in some cases, but we are more inclined to think that the trouble lies in the excessive costs involved under present conditions.

That is, in the over-all selling and distributing system.

In the second place, a private enterprise economy such as ours is founded on a basic reliance, however misplaced it may be in the opinion of some, on competitive forces to protect the consumer. In such an economy far and away the principal, if not the only, way for excessive profits to be gained is by successful efforts to maintain prices through monopolistic control, combination or some such method. We have recommended that this matter be closely and exhaustively examined.

In the third place, outside of high profits and distribution policies the principal way in which a manufacturer may contribute to excessive costs is through failure to achieve economies of manufacture in the way of adequate standardization, and reasonable model change policies instead of competing through expensive proliferation of models. In this field we have also recommended extensive investigation and action.

In the fourth place, we have made recommendations for public testing regulatory and information programs that, if adopted, would place the manufacturer very much on the spot to standardize, reduce unnecessary model changes, and put good products on the market at the lowest possible cost.

The CHAIRMAN: Gentlemen, the meeting is now open for discussion.

Have you a question, Mr. Thomas?

Mr. THOMAS: Mr. Chairman, in connection with this supplementary statement by Dr. Hannam, could he enlarge a bit on what the excessive costs are that are mentioned in this particular paragraph. I am referring to the sentence:

This may be so in some cases, but we are more inclined to think that the trouble lies in the excessive costs involved under present conditions.

I heard the word "excessive" used several times this morning, and I am wondering about the possibility of substituting the word "inequitable" in place of "excessive". I have experienced difficulty in defining, in my own mind, just what the word "excessive" implies. Costs of farm machinery, like other costs, are a matter of comparison, and it would appear to me that the word "excessive" might not be the word that should be used in this case. I would like to hear Dr. Hannam's reaction to the use of the word "inequitable", rather than the word "excessive".

Dr. HANNAM: It would seem that the opinion of the farmers of Canada from coast to coast is that farm machinery prices and more particularly parts and repair prices are too high. If they are too high, then there must be excessive margins somewhere. Farm machinery companies may be able to tell you that in the case of a certain implement the manufactured cost amounts to such-and-such, and the distributive cost between the factory and the farmer amounts to another percentage. It is our thought that this second percentage is altogether higher than it needs to be or should be. As to whether or not the word "excessive" is the right word, I am not in a position to say, although I think it is a very expressive word. The farmers of Canada certainly believe that that margin is excessive.

Mr. THOMAS: Do you feel, Dr. Hannam, that you have submitted proof in this brief that these costs are excessive? I know you made the statement, and I accept what you say. It is a descriptive statement, and perhaps it is the best that can be used. However, are there excessive costs? That is the point we are endeavouring to clear up, and I would like to hear a statement from the federation as to what proof they have concerning excessive costs.

Dr. HANNAM: I hardly see how we can present proof unless we go into an exhaustive study of these margins. In most cases we do not know what the manufacturer's price is. We have no authority to go into it. I do not think the machinery companies would give that information if we went and asked for it and if they knew what we were going to use it for. We have tried to bring to you, as a committee, the opinion of the farmers of Canada. We have summarized all the questionnaires we received and said: this is the opinion of the farmers of Canada. You are going to hear all of the manufacturers. It seems to me they should answer questions as to what is the percentage involved in manufacturing and then in the distributive margin of the prices.

Mr. THOMAS: After they give us that information, are we going to be in a position to say these are excessive costs? On what are we going to base that comparison? How can we know when a cost is excessive?

Dr. HANNAM: If you are not in a position to know that, maybe you would consider accepting our recommendation that a further expert inquiry, with authority to go into costs, could be instituted by the government. I do not know any other way.

Mr. THOMAS: I might ask another question or two. We know that in general retail trade in this country costs have gone up because of the demands—I do not know whether the word "demands" is quite right—the choice of the consumers for frills, and what might be defined as luxuries in connection with

the commodities purchased. For instance, in the food market, we have gone into expensive packaging which may be quite justified from the standpoint of sanitation and facility in handling. What about the same situation as it applies to the farm machinery market? We can hardly criticize the machinery companies for putting a fancy seat with special springs on a tractor and for streamlining the blessed thing every year or two in a different way to conform to car models and make some of these boys think they are driving an airplane. I do not know that we could criticize manufacturing concerns for trying to cater to the demands of the purchasers of farm machinery. The statement here does not say that these are alleged excessive costs, or possible excessive costs. The statement is quite bare and distinct "that trouble lies in the excessive costs". It is an implication that those excessive costs are there. I do not want to labour that point any further, but I would like some reaction. Dr. Hannam, on the share of responsibility of the farm consumers themselves, the purchasers of farm machinery, for upping these costs of farm machinery in the way of frills.

Dr. HANNAM: I do not know how much there might be in what you say about better machines or improvements on the machines. It is true, I think. The farm machinery companies will tell you, when they are here, that they are forced to do some of these things because of competition—the other fellow is doing it, and they have to do some things to compete, otherwise their sales will fall. They might say it is because of the importance the farmer puts on a number of these things; that the farmer wants this and that, innovations, something new and something more comfortable or convenient. I think that even if that is true, to some extent, we have suggested indirectly that it could also be improved by having testing stations and supervisory stations to test each new machine before it is sold to the public. This would bring pressure on the machinery companies—all of them—to put out fewer models and better models, so that there would not be this extra competition. I think the machinery companies will also tell you it is perhaps the farmer's fault. They will tell you there is too high a cost in the number of demonstrations they have to give in order to compete with the other fellow, and in the number of times they have to bring someone from headquarters out to do this and that. This is perhaps what we mean by the over-all distributive system. The way it is done today is the kind of thing that builds up undue cost in the real job of selling machines. This is a program that is directed by the big companies, and I do not think there is any question of having them change their policy and perhaps reduce the selling price to the farmer. If all of them would do it, or if there were sensible regulations that required all of them to cut out the excess notions and costs, to have fewer models, to have more efficient dealers—as the Saskatchewan administrative officer has said—and therefore have a better supply of parts available for the farmer, it might have the time of the farmer as well as the time of all the agents in doing the job they have to do. This is our thought.

Mr. THOMAS: Is it the opinion of the federation that it would be possible or feasible for governments to regulate or direct the machine manufacturers and distributors in this regard; that is, limit the number of models they could make, or compel them to standardize both in Canada and in the United States? What are the possibilities in that field?

Dr. HANNAM: We are not suggesting an elaborate regulation to cover everything the machinery companies do, but our observation is that the administrative office functioning in Regina has already effected certain improvements in the dealer set-up and the distributive system for farm machines. We think if that were done with five or six similar ones across

Canada, introduced by the provincial governments, the work of that administrative officer, who necessarily has to work with the company, would not be entirely regulatory. Remember they say they must regulate dealers because we license them. There could be a few more regulations established for the testing of machines, and the administrative officers in the province would have to give their approval before the new machine was offered to the people. I think that in a few cases, where they license the dealers and where they test the machines and have to give approval before the machines go to the farmer, these two regulations alone might make a big improvement and might be welcomed by the farm machinery companies. It might relieve them of the need for trying to bring out a new machine every year. I do not suppose they would be able to do that because as it is now sometimes they bring out models at the last minute, even before they are perfected to their own satisfaction and they have more trouble with the first model than later models just because they hurried to get it out in competition with someone else, or before someone else got out with that particular idea.

Mr. THOMAS: My opinion, Dr. Hannam, is that this is a very good brief, and I enjoyed going through it. I think it is well drawn up. However, if we are going to delve very deeply into this whole matter of machinery costs, we will have to get below the surface here and there—I am sure of that.

There is one more question I would like to pose along a different line, and that is this: has the federation of agriculture considered, from the national point of view, the desirability of encouraging the manufacture of more of the machinery used in Canada? It is pointed out in the brief that 80 per cent of this machinery is imported. We have in Canada today a great deal of unemployment. Has the federation discussed this matter among themselves? Have they taken a stand on it, or would they be willing to discuss the matter of encouraging the manufacture of a greater share of the machinery which we use in Canada?

Dr. HANNAM: We would be very interested in that angle, and whether or not such a policy would mean better machines at lower cost for more Canadians. I am not in a position to comment on that. It seems to me, however, that the automobile companies and implement companies all make quite a point today of contending that a large output is the thing that enables them to lower the price. So that since we have no tariffs on farm implements either way between Canada and the United States, it may be that increasing the volume here in certain of our factories, and increasing the volume in certain factories in the United States would lower the cost of manufacturing machines. I know there are some people who believe if the automobile industry would adopt a different policy we would not have custom tariffs which make the price of our automobiles so much higher in Canada than in the United States. I have heard businessmen, who should be in a position to speak on this, say that this is one of the best solutions to remedy the high cost of automobiles in Canada. I do not know whether or not they would be right. If we have the volume of business that we want in our companies, does it matter whether implements are bought in the United States or whether they are bought in Canada? If we make them here, in Canada, to sell in Canada, would we be any further ahead? I do not know.

Mr. THOMAS: Would you subscribe, Dr. Hannam, to this statement: that farm machinery prices, in common with all other prices, are a matter of national concern, and should we not take the stand that we must get the best possible machinery for farmers regardless of its effect on the rest of the country?

Dr. HANNAM: There is no question about it.

Mr. HORNER (*Acadia*): My question is along a somewhat different line. I wonder if Dr. Hannam, in his study, came across any particular time when he thought machinery prices increased the most? I think that perhaps this question will come up in the studies of the committee. He stated, on page 11, that the cost of machines rose, and his figures are from 1950 to 1960. I wonder if he noticed, or if any of the members of this organization noticed, any particular time since, say, World War II, when machinery prices to the farmers increased at a rather sharper rate than at other times?

Dr. HANNAM: I will refer that question to Dr. Hopper or Mr. Kirk. They are both economists. They might do better on that.

Dr. HOPPER: There are some references on page 11 to changes from 1950 to 1960. Beyond those, I do not think we have any additional information.

Mr. HORNER (*Acadia*): Did machinery costs go up sharply, say from 1945 until 1950, or did they rise from 1950 to 1955 or 1955 to 1960, or was it a general rise at an even rate over the past 15 years?

Mr. KIRK: I am sorry, we do not have those figures here, but I think the picture certainly was, first of all, that there were sharp rises in prices up to 1951, and this was the major period of inflation in the economy as a whole. Farm machinery shares in that. It is also true that there have been significant increases in prices in 1950. There has been a fairly steady rise in the price level of farm machinery in the 50's. I think probably it would not be as rapid as in the period up to 1951.

Mr. HORNER (*Acadia*): That answers that particular question. I have another one here. I wonder if Dr. Hannam, or any other member of his group, made any study as to what machinery was selling for in other countries? Just recently International Harvester opened a big plant in Scotland for the manufacture of tractors there, and the question which comes to my mind is: what are those tractors being sold for in England and Europe, as compared with the price of tractors in Canada? Though I have referred only to International Harvester the same applies to other companies and, as members of the committee are aware, Massey-Ferguson carries out a large part of its manufacturing processes in England. Have any figures come to your attention in that regard?

Dr. HOPPER: No.

Mr. COOPER: I have been dealing with an investigation into excess profits on repairs and spare parts. I have experience of a charge of \$114 being made by the Cockshutt company for a tractor chain and yet I could get the same type of chain from a company in Saskatoon for only \$52. It is the same chain, though it may have a little red paint added to it, and that is the only difference. That company is making a profit by selling those chains at \$52, and yet Cockshutt charge \$114. Has the federation made any investigation into the high cost and profits on repairs?

Dr. HANNAM: We have not done that, but we are not surprised at those figures you gave in respect to repair parts because we have many reports of unduly high prices, or what appeared to be unduly high prices, for particular parts. This seems to be a conscious policy on the part of many of the implement companies.

Mr. NASSERDEN: Have you received any complaints in regard to the vagaries of warranties offered on farm machines, and did your organization make any suggestions as to something that might be in the contracts between the farmers and agents?

Dr. HOPPER: Not one of the farmers who replied to our questions mentioned that fact.

Mr. DANFORTH: Mr. Chairman, I should like to take exception to a statement made by Mr. Thomas about this brief and I wish to say that, actually, I am disappointed with it. I should like to elaborate just a little on that as I have some questions to ask. I appreciate very much the supplement added to the brief this afternoon, but I am still of the opinion that it is not strong enough and does not go far enough. I am sure it is not consciously done, but I feel this brief is going to make our task a little more difficult and I should like to illustrate the reasons why I say that.

In the supplement we have a statement as follows:

We—

meaning the federation.

—did not make the claim that the problem lies in excessive earnings by dealers, in fact we said that we did not think this was so.

My point is that other segments of the industry can use statements like that to their advantage, and I must say I register disappointment because of that. This is an investigation into the high cost, or so-called high cost of farm machinery, and it was at the instigation of farmers and farm organizations that our committee undertook this particular investigation. I am also sure that all members of the committee, whether consciously or not, relied to a great extent on the federation of agriculture—because of its national reputation—to bring before us points that farmers would wish to have investigated extensively.

I should like to know why it was that the federation laid down a policy of channelling its recommendations and suggestions into such a narrow field. I cannot understand that, and my questions this morning were based on that line. I cannot understand why it is the policy of the brief to narrow the investigation instead of seeking to have it widened into all fields, and why all segments of the industry were not investigated, and investigated thoroughly. The brief states that there is a feeling excessive costs exist but then, by such statements as that, goes on to assume that costs are not excessive in particular channels, channels which I have no doubt members of the committee want to investigate. Certainly, if I were one of the other channels of the industry being investigated, I would quote the federation that, in their opinion, there were not excessive profits in my particular segment of the industry. What is the reasoning behind this?

I have enough experience of briefs presented by the federation of agriculture to know the federation is perfectly capable of looking into all corners of problems, when it so desires. Why was the policy changed? Why has it been narrowed?

Dr. HANNAM: Mr. Danforth, we have not the slightest thought that our policy has been changed, and we do not admit that it has. I appreciate your saying that the federation has considerable prestige for its work, and we try to maintain that prestige. We have done an enormous amount of work on this brief. I do not know if that work is apparent, but we certainly did it. We have studied royal commission reports on farm implements and we have produced this brief, sincerely and conscientiously, as the best effort we can make on this particular subject. We do not consider that we are narrowing our study, leaving out any part of it, or anything like that.

As honestly as we could, we have been trying to put forward criticisms of the farm machinery business that we felt we had reason to substantiate. Beyond that we did not want to go because we did not feel we could back

up other charges. I agree with you when you say we could ask for an investigation into other things. We could have included a few sentences to that effect, if it would have helped, but I do not know that it would. However, in the case of dealers we did say this:

We do not necessarily claim that excess profits are made by dealers in farm machinery and parts. This may be so in some cases . . .

That is all we said and the farmers we questioned did not claim that the dealers were making excess profits. We did not say they were but we did refer to the number of dealers, to their efficiency and to whether or not they maintained sufficient supplies, and said that the whole result of the system was too costly. However, we did not make the dealer the scapegoat, or anyone else, for that matter.

Mr. DANFORTH: Dr. Hannam, I must be perfectly fair in so far as the federation is concerned and say it should certainly be complimented on the recommendations it has brought in, but my main point is that the federation did not go far enough. You did not get into the problem deeply enough and I should like the federation to come in here and ask this committee to investigate, on behalf of the farmers, to see if there are excessive profits, in part or in whole, on the part of the dealers, and to see if there are excessive profits, in part or in whole, on the part of the manufacturers, rather than to assume there might not be. It seems to me that the attitude of the federation is changing and that you are assuming such is not the case. There might have been some misconception about the statement that you could not substantiate claims, but certainly I believe you could question whether there had been excessive profits without having to substantiate your question.

Mr. NASSERDEN: I should like to return to the question I raised a moment ago. On pages 15 and 16 of the brief you have referred to a series of instances where parts had been slow in coming forward from the companies. Do you know were they breaches of the contracts in so far as warranties on machinery were concerned?

Dr. HANNAM: Yes, if they were on new machines.

Mr. NASSERDEN: I am thinking of a farmer who may have an eight-year-old machine or a four-year-old machine. The contract he signs states that spare parts will be kept for ten years but, even so, he may have to wait two months and at harvest time possibly a week, to get a certain part, a feeder chain or something like that, and that is an excessive length of time.

Dr. HANNAM: I do not think that would come under the warranty at all. It might, however, come under the law in respect to maintaining a supply of parts for ten years.

Mr. NASSERDEN: It is part of the contract?

Dr. HANNAM: Yes.

Mr. NASSERDEN: But you have not made any recommendations on that, or maybe I have not noticed them in the brief. You directed our attention to the problem, however.

Mr. KIRK: Perhaps that should have been brought out more clearly in our recommendation on the setting up of a farm machinery administration. It was certainly in our mind and we should have made it much clearer. We believe that the supreme duty of a farm machinery administration would be to administer the law in respect to parts, their distribution and the maintaining of an adequate supply of them. This, we suggest, should be a fundamental responsibility of such an administration in supervising the licences granted by it, and in ensuring that dealers lived up to the responsibilities of their licences.

Mr. NASSERDEN: I think this is a most important point because, during the last ten years, it has become a common practice for companies to disregard farmers in this respect. On two occasions I have had personal experience with new machines in their first year of operation, and I certainly believe the company did not have any regard for its contract nor for me as a farmer and the investment I had put into its machinery. I am sure that many farmers across the country would have liked to see something definite in the brief as to the attitude of the federation which represents them.

Dr. HANNAM: I have had experience of that myself, and no doubt about it.

Mr. BOULANGER (*Interpretation*): Dealing with what Mr. Danforth has said, I feel that he seems to want to give the federation rights which it does not have. When we asked the federation to present a brief we expected to be presented with a brief, and we were. It is an extremely fine brief, but the point is that we did not ask the federation to carry out an investigation on its own behalf. The investigation which is to be carried out is to be carried out by this committee.

Within the terms of the brief presented by the Department of Agriculture are certain indices which indicate fluctuations, rises in price of agricultural machinery. But there is no clear indication of actually prices paid for actual machinery.

It is up to the committee to examine the prices over the last ten to 15 years to establish a list of actual prices, and to determine what the increase in prices has been. Then we can determine whether or not these increases have been excessive. We can compare them, for instance, to increases in the price of automobiles, and such things.

Mr. MUIR (*Lisgar*): My question arises out of a suggestion by Dr. Hannam, when speaking for the federation before this committee. I understand he is suggesting that the committee recommend that an administration be set up in order to test new machinery and to regulate the standardization of parts.

Dr. HANNAM: And for the purpose of licensing dealers.

Mr. MUIR (*Lisgar*): Yes, to license dealers. Would you not consider, having regard to the wide variation in the types of farm machinery used throughout the country, that for this machine testing, the regulatory powers be placed under provincial jurisdiction rather than under federal jurisdiction?

Dr. HANNAM: Yes, we did consider that.

Mr. MUIR (*Lisgar*): Where would you bring the federal government into the picture in this particular phase of the situation?

Dr. HANNAM: Well, in our recommendations at the end, we suggest an expert inquiry into it from the standpoint of combines investigation.

Mr. KIRK: Yes, and there was also the suggestion for federal encouragement and the national application of this program through a federal and provincial financing arrangement, or through facilitating co-ordination of the work in the various provinces.

Mr. MUIR (*Lisgar*): Would you consider that the federal share in this thing would be to set up more or less of a co-ordinating council? Is that right?

Mr. KIRK: Yes.

Dr. HANNAM: To supervise and to finance.

Mr. SOUTHAM: Are you suggesting that the cost should be shared on a three-part basis, with the machinery companies contributing a fair portion along with the federal and provincial governments? Do you think that the levels of government and the machinery companies would stand to benefit directly

through prestige that they would get from having their machines pass the tests, and as a consequence they should be required to pay a share, or a part of the cost?

Dr. HANNAM: We did not go into that.

Dr. HOPPER: I do not know how they finance the Saskatchewan agriculture machinery administration. We did not ask about that.

Dr. HANNAM: I think there is an advantage in having the financing done by the provincial and federal governments, because if you have the machinery companies helping to finance a testing station, then they are going to have their say about how it is administered. That is not the idea.

You need this thing administered in the interest of the people who are going to use the machines. Therefore I think it would be better—my own thought is—that it would be better not to ask them to help to finance it.

Mr. THOMAS: I have one more question I would like to ask, and it is directly concerned with the matter of the increased price of farm machinery.

Now, we know that in the early days some of our farm machinery was rather cumbersome. I remember the early tractors. They used to travel at two miles an hour, with their steel wheels; and while they would pull a big load, still they were very cumbersome.

They did not begin to replace horses until another 15 or 20 years had passed, and the tractors themselves have become much more efficient and much more manoeuvrable, and had improved in many ways.

It was not until rubber tires came into use that tractors really began to replace horses on the farm.

Now, over the years—and this would apply, I suppose, and continue to apply all through the years—there has been an intrinsic increase in value and improvement in our farm machines.

Dr. HANNAM: That is right.

Mr. THOMAS: Farm machines today are much better than the farm machines in times past.

Dr. HANNAM: Yes.

Mr. THOMAS: Have the economists of the Canadian Federation of Agriculture arrived at any idea as to what part of the increased price of farm machines is due to the actual increased value, and not to inflation in our economic system?

Dr. HOPPER: We have not studied it, but there are studies going on, I believe, in the United States, to determine if the greater efficiency of the machines today represent any increase in price at all, or whether the increase in the price represents the efficiency. I understand there are studies going on.

Mr. THOMAS: My first experience with a tractor was with the "arm-strong" method of starting. You had to climb up on the flywheel, and while there throw yourself around it and wrestle with it in order to get the thing under way. It was quite a little trick, and it provided entertainment for us for many years.

I also worked on the business end of a crank, with the old "arm-strong" method. Sometimes you would be pretty roughly dealt with, should the crank go the wrong way, and the machine backfire.

But now we have the self-starting devices, as well as many other refinements and frills added to our farm machines. These make them much easier to handle, and they add great value to the machines.

I wonder if the federation is prepared to admit—and I judge that they are—that our machines have actually increased in value, and that the increase in cost would be justified because of the increase in value of the machine itself?

Mr. KIRK: The fact that there have been improvements in farm machinery is certainly true, and no doubt many of them, if not all of them, involve added cost in the manufacture. I am sure that is a thought which should be taken into account. However, improvements do not necessarily add to cost. Also part of the increase is certainly due to the over-all inflationary picture in the economy. That is quite a question in itself.

But we did try, on page 11, to illustrate a number of machines, which, as far as we could determine, have not changed. They have been issuing the same machines over a period of years. We tried to illustrate some of the price changes which have taken place, as closely as we could get them, with the quality factors eliminated. We simply made a selection of that kind of machine. That is the only attempt we made to arrive at that kind of thing.

Mr. MUIR (*Lisgar*): May I ask a supplementary question? I wondered if Dr. Hannam had considered the cost of setting up these administrations, and if the result would justify the cost? Because, after all, we have to credit the average farmer with enough brains and know-how to operate his own particular farm machinery. So I suggest it is doubtful whether the cost of this administration would prove anything.

If the machine is not good, the farmer is not going to buy it. And if the farmer does not buy it, then the machinery company is not going to make it. This program would cost a considerable amount when spread over the country. I wonder whether the results would be justified.

Dr. HANNAM: My opinion is that they would be well justified. Taking that statement we have from the Saskatchewan administration officer, I think there is evidence that they feel there has been quite an improvement. But let me give you a personal experience.

I bought a hay crusher last spring. It was a new machine. We did not know much about it. I went to a fellow out at the Kemptville school to try to learn which one might be the best to buy. There were about 20 of them, and they were working, but they were not competing side by side on the same job so that you might have a good chance of making comparisons.

There was nobody to talk to about it except the man who wanted to sell them. It was all right to see that they operated, but I did not learn very much. When I came home I did not know which one I wanted to buy.

Well, a couple of salesmen came out to see me, and I bought one. We used it for haying time, and it was fairly satisfactory. But as soon as haying was over, the agent came back to me and said: "We want to send your machine back to the plant." I said to him: "Why?" And he said: "There are some weaknesses in it that we did not catch, and we want to go over it." I said: "All right." He said: "It will not cost you anything." So I said: "Fine." So he took the machine away, and it has not come back yet.

My point is that here were about 20 of these machines, and I did not know anything about them at all. If I could have gone to a machinery station and said something like this: "You have tested all these machines. What is your expert opinion about this one, and about that one, the other one, and so on?" I would have had the non-biased opinion of the person who was qualified to compare these machines, and he could have given me some advice which would have been useful to me. This is one of the things.

In addition to that, there is the licensing of officers. Remember that we said that every dealer would have to be licensed. It may be that a great many of the dealers we have today are not good enough. That is, they do not now their jobs, they are not well enough qualified. It may be they are not given a good enough chance by the company.

In any case, if we have regulations and licensing, it would be possible that we could get good dealers who are well-equipped, but with not too many models; and when a company puts a new machine on the market, they would have to prove that it is good, and that the manufacturer is actually able to stand behind it and to supply parts for it.

It seems to me that this type of regulation would be extremely valuable, and that it might be very effective in improving the whole distribution program for the machinery companies.

Mr. COOPER: That is one of the things I wanted to bring up, and also the matter of testing the machine before it goes out to the farmer.

I bought a new tractor last fall for \$6200. A week ago Wednesday they came to my place and said the tractor had to have a new head, new sleeves, pistons, bearings, and crankshaft.

When they have finished with it I shall have a secondhand, re-built tractor instead of a brand new one. And remember, it worked for only one week, yet they are calling them all back in now for a complete overhaul job. These testings would not benefit us unless they put out that machine in the model in which a new tractor would be manufactured.

Dr. HANNAM: Yes, the company would do that.

Mr. COOPER: If they are tested they should be tested and approved before they come out.

Dr. HANNAM: That is our recommendation.

Mr. DANFORTH: If I may comment on Mr. Boulanger's remarks, in the most part I agree with him, but I must take exception to the part where he criticizes my remarks about the federation. I wish to point out that my remarks about the federation are the result of being present at meetings of two Canadian federations and hearing their suggestions. This one presented to us here today appears to be a much watered-down version. I should have thought that the federation's cry and request here would be the cry of the farmers. I would like to direct my question to Dr. Hannam. I know that your organization is engaged in many studies on behalf of farm organization and this machine price has been a problem of your organization for many years. I notice that you alluded, very briefly, in your brief submitted today, to co-operatives and their efforts in this behalf. If I understand it, you mentioned they could make their own submissions—and properly so. My question is this. From your observations of the co-op and your own investigations on behalf of the farmers themselves, is there any work being done or contemplated, either to encourage farmers themselves or, through the work of the federation, to take advantage of a co-operative organization to reduce the cost of farm machinery to farmers? Is there any concerted effort or method on the part of the federation in the foreseeable future to take any action in this particular field?

Dr. HANNAM: I do not say that the Canadian Federation of Agriculture is equipped at all to go into the co-operative manufacture or distribution of machinery—not directly. We are in favour of producers going into the manufacture and distribution of any machines, or any matter of supplies needed on the farm, as far as that goes. I do not suppose at the moment that we have any declaration that we want to see more farmers going into the farm

machinery business. The farmers of the United States and Canada have felt that they should go into the farm machinery business and a great many of them have done so. I do not mind saying I think many of them would say that to make a success of the manufacture and distribution of farm machinery is probably one of the most difficult things for farmers to do co-operatively. That does not mean that there is any consideration for anybody else. If you are going to manufacture machinery, you must manufacture a full line of it, you must manufacture the parts. As has been said here, the firm should guarantee parts for ten years. We must have a complete organization for distribution, with dealers, and so on, right over the country. It has to be a very extensive thing in order to be really successful. I suggest that you ask the Canadian Co-operative Implements that question.

Mr. DANFORTH: I am trying to find out if the federation feels there is a big enough field to cut the price of machinery to merit an investigation by the federation itself into this particular action. Would you care to comment on the effect it would have on the price to farmers if a farm co-operative could buy any quantity of such machines; for example, if a farm co-operative were in a position to buy from a machine company 40 tractors to distribute among its members rather than one farmer going to one dealer and purchasing one tractor.

Dr. HANNAM: The Co-operative Federation of Quebec has a complete distribution of tractors and farm machinery. The Canadian Co-operative Implements manufacture farm machines, right in Winnipeg. They have confined themselves pretty well to tillage machine, and they have a complete distribution of a tractor which they distribute on an agreement with the Cockshutt Company and they have been doing it on that basis for quite a few years. My own thought would be that there would not be much possibility for a small group of farmers, I mean 50 or a few hundred, going in to buy 25 or 50 tractors—unless they were able to set up a more permanent organization that could stock parts and service the machines. I think the farm implement business is one you cannot go into very well in a small way—and this is one of the handicaps when co-operatives want to go into business.

Mr. DANFORTH: You feel this is a specialized business to get into without a great deal of basic investigation?

Dr. HANNAM: It is a specialized field, there is no doubt about that, but it is not the kind of business you can go into in a little way and then grow up. You can just imagine the position at the co-operative end of it. They start out to make one machine and then make another and another; think of the fine time it would have competing with the more successful ones while it is growing up in that way. Yet that is the way a lot of farmer co-ops grow. I do not say it is impossible, but I think the experience in western Canada has been that they had to go into it in a pretty large way, and they have been successful in manufacturing tillage machines but they have not yet been successful in the whole run of farm implements.

Mr. DANFORTH: I can take it, then, that the federation, although it is observing it, is not doing any comprehensive study with the idea of, shall I say, promoting this or using it as an example, to the same degree that the federation is working with marketing schemes and promoting them. It is not to that degree? Would I be safe in assuming that?

Dr. HANNAM: That is right, yes. We are not putting the same enthusiasm and promotion behind the idea of farmers going in to the manufacture of their own machinery that we are all putting into the handling of their own marketing and even of processing some of their products in that field. That is true.

Mr. DANFORTH: I think we are at cross purposes. I am not dealing specifically with the manufacturing. I was thinking more of the distributing. You are speaking of curtailing dealerships and I am wondering, since the brief dealt so specifically with the curtailing of dealerships in order to increase the efficiency and lower the cost, if the federation have taken any consideration of farmers themselves, through co-ops or other organizations, by which they could have their own dealerships which would service a particular area as a means of reducing the cost of farm machinery to individual farmers. That was my point.

Dr. HANNAM: Some local and district co-operatives are in the machinery business. They have made an agreement with a large machinery company to sell. Our particular body, the Co-operative Federation of Quebec, has done that and is distributing on a provincial basis. This was certainly the objective behind the program in western Canada when they created Canadian Co-operative Implements and the three governments contributed capital to do that.

Mr. DANFORTH: I wonder if the Canadian Federation of Agriculture is aware that even in small local instances individual dealers act as wholesalers importing these machines and in turn wholesale to their own retail outlet and then sell to the farmers which, in effect, means almost a 40 per cent difference between the price of the article when shipped into Canada and when placed in the hands of the farmer. Does not the federation feel that perhaps in this field there would be room for a co-operative drive?

Dr. HANNAM: I feel that if a co-operative could go into business in a big enough way to establish an efficient distributive system, that would be so, but that means a complete system within reach of all the farmers they serve, with all the parts that are necessary and all of the service they ought to give, and covering all of the trade-ins they are prepared to take and then recondition and sell again. It is a big job.

Mr. PASCOE: My question is supplementary to that of Mr. Thomas in regard to the efficiency of farm machines, but it might be of some use for the record. I have here the 1960 report of the department of agriculture for the province of Saskatchewan. There is a chart showing the Saskatchewan farm machinery and parts purchases as a percentage of realized net farm income. In 1950 the farm machinery and repair purchases at retail prices comprised 41.6 per cent of the realized net farm income in Saskatchewan for that year. In 1955 it was 25.7 per cent, and in 1959, the last year for which figures are available, it was 25.4 per cent. Would Dr. Hannam, or one of the other C.F.A. officials care to express an opinion regarding this? Would the figures appear to indicate that the lower percentage of farm income now devoted to farm machinery purchases results from farmers making more efficient use of new machinery, or are they buying less machinery? It is down from 41.6 to 25.4 per cent.

Mr. KIRK: I do not know in any precise terms except it was between those two periods that there was a very drastic decline in the sale of farm machinery. I think this drastic decline occurred, according, not to exhaustive but our general statistical inquiries from our people, because of the poor conditions with respect to farm income. It was also due in part to an inevitable reaction to the very high level of post-war machinery purchases.

Mr. PASCOE: Would the 25.4 per cent of realized net farm income be a fair proportion of farm income spent on farm machinery?

Mr. KIRK: That question has to be analyzed. There are many factors concerned. One factor is as to what is the proper rate of technological change in the industry, how fast it should be expected to grow and how great the investment should be to keep the industry efficient. I just do not know what

kind of a proportion the total purchases should bear, or whether it would be possible to arrive at an optimum figure there. Perhaps it would be possible but I just do not know.

Mr. PASCOE: As a matter of fact, I was surprised that it was 25 per cent. I thought it should be more than that.

Dr. HANNAM: I would think 25 per cent is as high as it ought to be. That is a big proportion of the cost of farming, if you have to put 25 per cent into machines.

Mr. PASCOE: I would agree with you there.

Dr. HANNAM: Just to add to what Mr. Kirk said, I would think that the higher percentage in 1950 might be due more to the backlog of machinery that could not be purchased in the war years and then the farmers going into this in a big way for the five years after the war.

Mr. PASCOE: Probably that is the answer.

Dr. HANNAM: I think it would be.

The CHAIRMAN: Mr. Brunsden, I believe you had a question.

Mr. BRUNSDEN: Unfortunately I had to leave in order to fulfil another appointment. I do not think the question now is fitting.

Mr. HORNER (*Acadia*): I would like to ask Dr. Hannam two questions. The first deals with the idea of this testing. I believe there is a great danger in this testing. I can understand, for instance, the Nebraska test with regard to the power output of a certain motor. A test may be taken all over Canada and this motor will have a certain amount of power, although it will, of course, vary with the sea level. Soil and grass conditions, however, vary very seriously, and a cultivator might work fine on my light sandy loam but would not work very well at all on Elmer's heavy clay. This is the danger which I see in setting up testing in respect of certain types of machines.

Take, for example, a press drill. All around my constituency, if you can afford a press drill you are readily classed as a good farmer; but in some areas which grow good crops they do not use the drill at all because it would gum up with clay and be useless. Do you not agree that this is a danger in testing?

Dr. HANNAM: No. I would agree it is a problem.

Mr. HORNER (*Acadia*): The same thing would hold true in respect of haying equipment. I bought a baler once and it would not work for love nor money. Then I went to somebody else's field where there was a heavier type of hay and it just gobbled it up. The company claimed they tested the machine and it worked wonderfully. It would work on some types of grass but not on mine. I think this is one danger in testing machines. I can go along with it in respect of motors; that is fine. In grass and land implements, however, I see a great danger.

I have another question which has to do with the cost increase in respect of machinery. There is one type of machine that has not increased too much in price. I wonder why this has not when the others have. I am referring, for instance, to a handy cement mixer that the T. Eaton company sells. T. Eaton in their catalogue have a cement mixer priced at somewhere in the neighbourhood of \$50. Mr. Nasserden says this was around 1955 or 1956, but I think it was about ten years ago when I bought one and paid \$50 for it. This machine is built of iron, cast or otherwise. Why has it not increased in price the same amount as the others? I am wondering if you have ever questioned this point.

Another thing which comes to my mind is the grain grinder. It is not as popular today as the hammer mill. I remember that ten or fifteen years ago a grain grinder could be bought for about \$50 or \$75. Today it can be bought for relatively the same price. Why has this not increased to the same extent that other machines have? It is made of iron, some of it cast and some of it otherwise. Did you come across this or did you consider any of these things in presenting your brief?

Mr. SOUTHAM: I have a supplementary question. I can relate this to Mr. Horner's observations, and it is contrary to the line of thought which Mr. Thomas introduced. In respect of these increased prices, I have heard the suggestion given here that machine companies are now prone to add too many refinements to their machines which do not increase the farmer's productivity but do increase the cost. This is following one of the weaknesses of human nature; we are trying to keep up with the Joneses and follow the line of least resistance.

In large machines, like combines and tractors, these refinements do not add anything to the productivity, but they do help the machine companies to vie with one another and increase their sales. Mr. Horner pointed out the example of these cement mixers and grinders on which there have not been any refinements or improvements; they still do the same job and consequently the cost has remained much the same. Would you suggest that this be taken up in these test laboratories; that is, that they look at it and suggest that the companies do not go out of line? You could apply the same angle to the automotive industry. We have been getting larger cars with larger tail fins. The car does not take you from A to B any more quickly, and yet we are paying for it. I think this is a great factor. There is the question, are these refinements economically feasible?

Dr. HANNAM: I think there is a good deal in this. It is part of what we say. There certainly does not seem to be a need for new models every year, so many models, and so on. That is part of our particular thought here. If there were some appropriate way of approving these before they are put up for sale to the farmer it might result in a very great reduction in the number of models and the number of fancy things attached thereto. I do not know whether or not it would bring this result, but I would hope it would.

Mr. SOUTHAM: That is the opinion of most of the practical farmers to whom I have spoken.

Dr. HANNAM: I would not be a bit surprised if the machine companies would come here to tell you it is the farmer who demands this and say that if they do not put these things on their machines they will lose out and that the other fellow will get all the business. There may be something in that.

To come back to the matter of the cement mixer, I would be inclined to think that there may be a couple of reasons for that. In the first place it is possible that the margin that was taken ten or fifteen years ago was higher than it needed to be and that competition has narrowed that down. A blacksmith can make a cement mixer. I think there are so many persons who can make them that the major companies, if they are going to make them, have to make them on a large scale and meet all other competition. There may be something in that.

Mr. ROGERS: We have been speaking about restricting the models. In our tie-up with the United States there would have to be an agreement between the United States and Canada.

Dr. HANNAM: Yes. We mention in our brief that in a program of this kind there would be need for a good deal of international consultation. It is true that this is an extra problem.

Mr. CLERMONT: I believe there was a question asked as to why co-operatives do not buy in quantity. They do.

Dr. HANNAM: Yes.

Mr. CLERMONT: I believe most of our co-operatives carry a full line of farm and dairy equipment and come in competition with the private dealers.

Dr. HANNAM: Yes.

Mr. CLERMONT: It is done in Quebec on a large scale.

Mr. MONTGOMERY: Have you any idea how much this saves the farmer?

Mr. CLERMONT: The members benefit from any profit the co-operative makes at the end of the year.

Mr. NASSERDEN: I would like to know if Dr. Hannam thinks it would be fair for me to draw the conclusion that what they have recommended is that on a federal basis there be something like a board of machine standards somewhat similar to the board of grain commissioners which would have officers investigate particular complaints that farmers or others might have in respect of a certain machine or a breach of contract.

Dr. HANNAM: No; we did not recommend that.

Mr. NASSERDEN: Did you have something like that in mind?

Dr. HANNAM: Your committee might consider this. We did not recommend it. We have made a number of recommendations, but did not make that one. We did recommend an advisory committee on standardization which we said might be representative of farmers, governments, and machine companies.

Mr. NASSERDEN: Do you not think it would have to be on a federal charter plan in order that it would apply across the country and to give them control over it?

Dr. HANNAM: Yes; that would be a federal proposition.

Mr. ARGUE: Why not give them some power instead of making them advisory? We are loaded down with advisory boards now. Why not give them some power? I think Mr. Nasserden has an excellent suggestion. As I understand it, a federal board would have no authority within a province but would have in respect of interprovincial trade. That kind of authority would be sufficient to regulate the industry.

Dr. HANNAM: We have no objection if it can be worked out. Remember, to give authority to that kind of national committee would mean a pretty substantial measure of co-operation with the United States.

Mr. ARGUE: They would either co-operate or the machines would not come into the country because the machines could not be sold unless they came up to the standard, just the same as we do not allow animals unless they come up to certain standards. I think Mr. Nasserden's suggestion is an excellent one and I take it there would not be discrimination in respect of the United States.

Dr. HANNAM: We would support that if it could be worked out.

Mr. DANFORTH: Mr. Chairman, I would like to ask Dr. Hannam this question: you have had the advice of your economists and your experts and you have correlated all the information which came to you from the farmers. Since by your brief it seems that you do assume that the price of farm machinery is extremely high, where do you feel there is the greatest opportunity for either investigation or improvement? Do you feel it lies within the suggestion that models be stripped of their frills, perhaps, or that these so-called

frills be optional as parts which could be added at the discretion of the purchaser? Do you feel it would come through a standardization of models and perhaps the placing on the market of a lesser number of models to do a particular portion of farm work? Do you feel that is the field in which this committee or the industry has the greatest opportunity of making progress, or is there some other field in which you feel, through your investigation and information, that the farmers achieve a greater scope of activity?

Dr. HANNAM: That is one of our major recommendations. The other one, which is not included in that particular one, is the fact that the over-all machinery distribution today—that is the company policy plus the dealers and the way they function—appears to be a particularly costly system of distributing machinery. We think that could be revised and improved on to a great extent in respect of cost right from the factory to the farmer.

Mr. DANFORTH: By a change in established practice you feel there could be an economy?

Dr. HANNAM: Yes, plus some regulations through testing stations, and licensing of dealers; then, as you say, the cutting down of the number of models, and the standardization of many parts.

Mr. DANFORTH: For the record, would the federation agree that as far as price savings to the farmer are concerned, this could be achieved—and I am thinking more of a tractor—if it were sold on a stripped down or standard basis, and everything else put in the category of accessories which could or could not be added, depending on the desire of the purchaser. I am suggesting this rather than a complete unit, with a definite price. Do you feel there could be substantial savings in this way?

Dr. HANNAM: Well, maybe, but you must remember than even if you regulate for a machine, stripped, and you regulate it with all of the companies,—and I do not know whether it could be done or not, but let us assume that it could be done—and then you add a lot of other features which could be paid for as extras, the very fact they have to be made and have to be made available—and the parts have to be available, and so forth—would, I think, add to these costs, because if two companies do it, the others have to do it, and if some farmers buy them with these innovations, others will demand them.

Mr. DANFORTH: My point was that we sometimes find ourselves in the ridiculous position of having to buy a tractor equipped with a hydraulic system, which adds to the cost, and it is of absolutely no value in our particular work, but yet we have to pay an additional cost to get a stripped down model. To me it seems a ridiculous position in which to be put.

Mr. NASSERDEN: Mr. Chairman, that is not the case in western Canada. You can buy a stripped down model without these accessories. If you want the hydraulic system, the power take-off and belt pulley, cigarette lighter and all these other things, you can have them, and you pay for what you get. They may charge you something additional for putting these things on if the model they have is not equipped with them. However, they will take them off after having them on, if they do not have one without these accessories. I know, because I have had it done.

Mr. BRUNSDEN: Mr. Chairman, that brings up the question of whether or not you can control the farmer's desire to keep up with the Joneses. There is far too much incentive, from advertising and high-pressure salesmanship, encouraging a farmer to turn in his last year's model tractor and buy a new one. I am not saying the farmer is any worse than anyone else, because he is not. The same thing happens in the city with respect to cars, refrigerators

and television sets. But if, somehow, we could impress upon the farmer—and, in this connection the Canadian Federation of Agriculture is in an admirable position—that they are working against their own economic interests by being the victims of high-powered advertising, we would go a long way towards correcting this situation.

Mr. HENDERSON: I think the farmer himself is, to a large extent, to blame.

Mr. ARGUE: I disagree with you. It is high-pressure advertising, and so on.

The CHAIRMAN: Gentlemen, the Chair is of the opinion that we have reached the point where we should consider adjourning. However, before we do that, Mr. Kirk has a statement which he would like to make.

Mr. KIRK: I have just one thought. It is more or less a personal one and does not appear in the brief. It is in connection with the question of stimulating the development of the Canadian farm machinery industry, and I think it might be of some importance.

It seems to me that one of the very best ways for an industry to be stimulated is for that industry to be making something that is special to it, and which has a place in the international market. You will find this in connection with certain types of engines made in England, and this is the place where they are bought.

The Rolls-Royce engine which one sees through the plane window every time one goes on a trip is an example of where a country has specialized successfully. The point I am making is this: I do not know how much research Canadian farm machinery companies do, and even if they do some research, we have no assurance that if they do make some real breakthrough in design it will be manufactured, in fact, in Canada. But if Canada, as a nation, through quite fundamental technological research development—and I am not an engineer—could develop designs for engines or any other part of the farm machinery business, which really were breakthroughs and improvements, and could control these important technological advances so that Canada would become the center of their manufacture, it would be very beneficial. It has always seemed to me, not only in connection with machinery, but in other fields as well, that this would be a good way of stimulating the Canadian economy for both domestic and international markets.

Mr. BRUNSDEN: There is a good example of that in the last issue of the *Western Producer*. There was a display in Saskatoon of a German-made tractor. I may say that I have nothing against West Germany—I hope she prospers—but, to me, it is fantastic that a prairie farmer would be attracted to something new—and I might say it is a new tractor—and turn his back on a product produced in Canada through Canadian workmanship. I know that trade is trade, but I come back to the point I tried to make a short while ago, that we need to build up in the minds and hearts of our Canadian farmers a consciousness of their own position in relation to the rest of the Canadian economy. If we do that, we will not have this terrific turnover of tractors every year, and we will not have this attraction for tractors built outside of Canada. After all, Canadian built tractors, or partially Canadian built ones, are just as good as any tractors in the world. We had an experience in our province a few years ago. A number of diesels were brought out from England several years ago, and I think there are still six or seven of them on the sales lot. They were a flop under our working conditions. The people who bought them were stuck. I suggest that there is a great job of promotion to be done, and I think the Canadian Federation of Agriculture should take the leadership in educating the farmer with respect to his own position in the great Canadian economy. He prejudices his own position when he allows himself to become a victim of certain high-blown publicity efforts.

The CHAIRMAN: Dr. Hannam, I know the committee would wish me to express their appreciation to you, Dr. Hopper, Mr. Kirk, and through you, to all the members of the Canadian Federation of Agriculture for being with us today and presenting this very fine brief.

Gentlemen, our next committee meeting will be one week from today, namely, Friday, April 21, at 9.30 a.m. Our witnesses will be from the National Farmers Union Council.

ORDER OF REFERENCE

THURSDAY, April 20, 1961

Ordered,—That the name of Mr. Horner (*Jasper-Edson*) be substituted for that of Mr. Brunsden on the Standing Committee on Agriculture and Colonization.

Attest.

LÉON-J. RAYMOND,
Clerk of the House.

MINUTES OF PROCEEDINGS

FRIDAY, April 21, 1961

(6)

The Standing Committee on Agriculture and Colonization met at 9.35 a.m. this day. Mr. McBain, the Chairman, presided.

Members present: Messrs. Argue, Badanai, Boulanger, Clancy, Clermont, Cooper, Doucett, Dubois, Fane, Forbes, Forgie, Gundlock, Henderson, Horner (*Acadia*), Horner (*Jasper-Edson*), Howe, Knowles, McBain, McIntosh, Milligan, Montgomery, Muir (*Lisgar*), Noble, Pascoe, Rapp, Regnier, Slogan, Southam, Tardif, Thomas, Tucker, Villeneuve and Webb.—(33)

In attendance: From the National Farmers Union: Mr. Stuart A. Thiesson, Secretary; Mr. Rudy Usick and Mr. Mel Tebbutt, executive members.

Mr. Thiesson presented the brief of the National Farmers Union regarding farm machinery prices.

The Committee questioned Messrs. Thiesson, Usick and Tebbutt on the Union's brief.

Moved by Mr. Horner (*Acadia*), seconded by Mr. Fane,

*Agreed,—*That Index Numbers of Farm Prices of Agricultural Products, put out by the Dominion Bureau of Statistics be made an appendix of today's Minutes of Proceedings and Evidence (*See Appendix "A"*).

The Chairman announced that he would be unable to attend the afternoon meeting.

On the motion of Mr. Argue, seconded by Mr. Montgomery,

*Agreed,—*That Mr. R. Elmer Forbes be the Acting Chairman for the afternoon meeting.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING

(7)

The Committee reconvened at 2.35 p.m. The Acting Chairman, Mr. R. Elmer Forbes, presided.

Members present: Messrs. Argue, Badanai, Belzile, Boulanger, Clancy, Clermont, Doucett, Fane, Forbes, Forgie, Gundlock, Henderson, Hicks, Horner (*Acadia*), Horner (*Jasper-Edson*), Kindt, Korchinski, McIntosh, Montgomery, Muir (*Lisgar*), Pascoe, Rapp, Regnier, Slogan, Southam, Tardif, Tucker, Villeneuve, Webb.—(28).

In attendance: Same as morning sitting.

The Committee continued the questioning of the witnesses.

Agreed,—That farm machinery questionnaire sent to their members by the National Farmers Union be printed as an appendix to today's Minutes of Proceedings and Evidence (*See Appendix "B"*).

The Acting Chairman thanked the officers of the National Farmers Union for their appearance.

At 4.35 p.m. the Committee adjourned until Monday, May 1, at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

FRIDAY, April 21, 1961

The CHAIRMAN: Gentlemen, I see a quorum. This morning we have with us the National Farmers Union presenting their brief to the standing committee on agriculture and colonization, inquiring into the price of farm machinery.

Representing the national farmers union we have with us Mr. Stuart A. Thiesson, secretary of the national farmers union, and secretary of the Saskatchewan farmers union.

Sitting next to him we have Mr. Rudy Usick, executive member of the national farmers union, and president of the Manitoba farmers union. And finally, around at the corner of the table, we have Mr. Mel. Tebbutt, executive member of the national farmers union, and president of the Ontario farmers union.

I believe Mr. Thiesson is to present the brief, so I am pleased to call upon him at this time.

Mr. STUART A. THIESSON (*Secretary of the National Farmers Union and Secretary of the Saskatchewan Farmers Union*): Thank you, Mr. Chairman, and members of the committee. For the information of those of you who may not be aware of it, the national farmers union is a change in name from the interprovincial farm union council, and it includes in its membership the members of the farm unions in British Columbia, Alberta, Saskatchewan, Manitoba, and Ontario.

Mr. HORNER (*Acadia*): Mr. Chairman, before Mr. Thiesson proceeds, I wonder if we are going to follow the thought expressed at an earlier meeting. I could look up the reference, if you wish; the thought was that the briefs would be presented beforehand, that we would not have to have them read in all their details, but could immediately start in to ask questions on them. It does not matter to me one way or another, but I wondered about it. This brief was presented to us quite a while ago, and I think most of the members have read it. It does not matter at all to me, but I wondered if we were going to follow out the thought that was evident at an earlier meeting.

Mr. CLANCY: I would like to go along with that. But on the other hand, even if most of our members have read the brief, I think the witness should be asked to give his presentation.

Mr. HORNER (*Acadia*): If he is going to make a statement on it, all very well; but this is quite a detailed brief, quite a long one, and it has 83 points in it. I know we plan to sit this afternoon, and I know that we shall get over it in any event.

Mr. ARGUE: Mr. Chairman, Dr. Hannam went over his brief, and when he came to detailed items, he skipped over them.

The CHAIRMAN: We gave the Canadian Federation of Agriculture an opportunity to read their brief. So I think in all fairness to the farm unions this morning we should give them the same opportunity.

Mr. McINTOSH: Mr. Chairman, what Mr. Horner has said is quite correct. That was the idea in getting the briefs ahead of time. It was not to put them into the record at that time, but that we should start in clause by clause without their having to be read all over again. We assume that everyone

has read over the brief, because it has been in our hands long enough already. So rather than to have it read over again, I think we should start in with the questioning.

Mr. PASCOE: Mr. Chairman, I think the witness should be allowed to make some statement.

The CHAIRMAN: If it is agreeable to the committee we shall ask Mr. Thiesson to review his brief. He may want to deal specifically with some clause and read it word for word. Would that be agreeable?

Mr. THIESSON: I am in the hands of the committee.

The CHAIRMAN: Well then, if it is agreeable to the committee we shall ask Mr. Thiesson to proceed on that basis.

Mr. THOMAS: Mr. Chairman, might I ask if that is satisfactory to the farmers union? Do they feel that that method of presentation would be as effective as if they should read through the brief first? They are here, and I think we should allow them to present their brief in their own way.

Mr. THIESSON: In reply to that, Mr. Chairman, I might say that we have gone to some considerable work in the preparation of this brief. I do not know how valuable the members of the committee will find the information, or how closely it will correspond to their points of view.

If the members of the committee have read the brief, I would certainly be prepared to proceed with it on the basis of a summary, and then go into the discussion. However, if there are members of the committee who have not found time to read the brief, I would hope that they would find it valuable to go through it and to know what the contents of the brief are. I could possibly cover most of the points on the basis of a summary and I am quite prepared to proceed in whichever way the chairman directs.

Mr. FORBES: It seems to me that if Mr. Thiesson read the brief it would be more inclined to prompt questions; in other words, refresh our memory on the brief as it was being read, and the committee would be more alive and take a more active part than if they just looked it over themselves. I read it last week and have pretty well forgotten the contents. I do not believe it would take too long to read it; I think twenty minutes would do it.

Mr. HENDERSON: I think the brief should be read.

The CHAIRMAN: The majority opinion of the committee seems to be that the brief should be read. I will ask you, Mr. Thiesson, to proceed in that manner.

Mr. THIESSON:

1. The national farmers union welcomes this opportunity of presenting the views of the organized farm movement in Canada on the question under consideration by your committee.

2. Our members, engaged in the primary industry of agricultural production, are vitally affected by all cost factors entering into the production costs of farm products. The cost of procuring and operating farm machinery represents a major part of farm production costs.

Impact of Technology in Agriculture

3. The technological role of farm machinery in Canadian agriculture over the past twenty years has had a tremendous effect in increasing the output of agricultural products. Besides meeting the domestic food needs of the growing population, Canadian farmers are providing commodities for export trade. But the effect of higher production has not been reflected in more favorable price returns to the producer and as a result the over-all financial position of the average farmer has been in a state of decline.

4. The royal commission on price spreads of food products indicated that between the years 1949 and 1958 the costs of marketing food between the farmer and the consumer rose 84 per cent although the average Canadian earning income from non-farm employment was able to spend a smaller proportion of his weekly pay cheque on food than he had in previous years. The studies of the commission further revealed that the farmer's share of the consumer dollar had declined from 58 per cent in 1951 to 44 per cent in 1958.

5. The general trend of agricultural prices has been downward since 1951, while upward trends in non-agricultural prices, consumer incomes and business investments, increase the costs of goods and services required by farmers.

6. As a result of the decline in farm net income, Canadian agriculture is in a state of depression. Thus, while a 20 per cent decline has taken place in the index of farm prices between the years 1951 and 1960, a 16 per cent increase has taken place in the composite index of farm production costs.

7. Farm machinery costs have more than doubled since 1940 while operating and depreciation expenses have more than tripled.

8. The technological revolution in agriculture has also had its effect on the human resources engaged in agriculture for a livelihood. From 1941 to 1956, farm population decreased from 27 per cent of the total population of Canada to approximately 17 per cent of the total. During these same years the farming areas remained practically unchanged, although their number declined from 732,832 to 575,015; but the average size of farm unit increased from 236.8 acres to 302.5 acres. As a result, there are only about 60 per cent as many workers in agriculture today as there were a decade ago, while during the same period the number of farm operators has declined by 30 per cent.

9. The continuing trend towards larger farms and the use of labour-saving machines has meant a high capitalization per farm. Compared with 20 years ago, the amount of land under cultivation per farm worker has increased 67 per cent. The livestock population per farm worker has increased 93 per cent, and the volume of power and machinery 213 per cent. Thus, the total of these three forms of capital per farm worker is now almost twice as high as it was 20 years ago.

10. The increase in productivity per man in recent years has been greater in agriculture than in any other Canadian industry, having risen 48 per cent from 1946 to 1957. In manufacturing, the increase was about 40 per cent—in transportation about 34 per cent—in mining about 31 per cent—and in trade only about 7 per cent.

Relation of Income to Costs

11. It is a significant fact that while the cash income realized from the sale of farm products during the period 1958 to 1960 was at a comparable level to the record high of the 1951 to 1953 period, farm net income during the 1958-60 period has shown a decline of a figure approaching 50 per cent of the 1951-53 level.

12. Operating and depreciation expenses, on the other hand, over the period 1950-59, has shown a continual and increasing rise. These comparisons are illustrated in chart I.

Chart I

Relation of Farm Net Income to Cash Income and Expenses
of Operating and Depreciation—Canada
1950-1960

Source: DBS - Farm Net Income, Farm Cash Income.

13. A more specific examination of the actual items relating to farm machinery costs to the farmer during the 1950-1959 period is indicated by chart II. Farm operating expenses, including items of depreciation on buildings and machinery, tractor costs, truck costs and machinery repair costs, have shown a steady increase.

14. It is our contention that because of the wide cost-price disparity prevalent in agriculture, farm operators in Canada are now, in fact, living off the depreciation allowances granted for buildings and equipment, the full impact of which will not be fully realized until the need for replacement takes place.

* 1960 - Estimated

Input Vs. Output

15. In considering the role of advancing technology in the agricultural industry, we believe it is a logical assumption that increased inputs into agriculture can only be compensated by higher outputs. If the initial advantages of higher outputs are then offset by declining and unstable prices within the industry as a result of wide-spread acceptance of new technology, the net effect to the average-sized farmer may be a lower net income return.

16. Because of the tremendous impact of mechanization to agricultural production and its resulting effect on farm prices, it is our view that thought must also be given to developments in the farm price field and the impact this has had on the purchasing power of the Canadian farmer and its effect on the economy of the nation as a whole.

17. The royal commission on Canada's economic prospects observed that over the past twenty-five years the physical volume of agricultural output in Canada grew by some 30 per cent to 40 per cent. It anticipates that over the next twenty-five years agricultural output may grow by perhaps 65 per cent or 70 per cent which will enable Canadian agriculture to produce a much larger quantity of foodstuffs on little more than the acreage currently in use, while the increasing productivity of farm labour will permit output to rise with a declining labour force.

18. What will be the purpose of it all if the ever-increasing agricultural output results in a lower price for the unit of farm production while farm cost items continue to increase unabated?

19. In an enlightening analysis of farm price behavior, Professor Willard Cochrane, university of Minnesota, raises the question: "Why, in the face of falling farm prices and declining gross incomes, do farmers persist in adopting new technologies, thus expanding output?"

20. Cochrane then proceeds to analyze this seemingly irrational behaviour on the part of farm people. He observes that it has its beginning in the fact that society places a high value on technological development and its adoption, and the fact that technological advance in agriculture is always measured in terms of total agricultural industry.

21. Thus, we see the effects on the industry of a particular technology or production practice after it has been widely adopted throughout the industry. He notes that farmers operate in a type of market where no one farmer can or does have any perceptible influence on the price of his product or his factors of production. The farmer is a price-taker. He takes the price offered him because he is such a small part of the total market that he can have no perceptible influence on the market or on the market price.

22. Cochrane believes that technological advance has the effect of lowering the per-unit costs of production only for its initial users who may realize increased net returns, because they are such a small part of the market that total output is not increased noticeably and price does not come down. Then a powerful incentive is created for other farmers to adopt the technique. Seeing the income advantage accruing to Mr. Early Bird, Mr. average farmer decides he will adopt this cost-reducing technique. This includes most farmers in the community.

23. But the widespread adoption of this new technology changes the entire situation. Total output is now increased, and this increase in the supply of the commodity lowers the price of that commodity. With an inelastic price demand at the farm level, gross returns to producers must fall. Further, over a period of time, any increases in net returns are capitalized back into the value of the land, with the result that land prices rise. So in the long run, by the time most farmers have adopted the technology, the income benefits that the first farmers realized have vanished.

24. Mr. average farmer is right back where he started as far as his income position is concerned. Once again, average unit costs of production are equal to the price, and no economic surplus remains. As the price of his product is declining, but his unit costs of production are unchanged, to stay even with the world he is forced to adopt the new technology. The average farmer, Cochrane concludes, is on a treadmill with respect to technological advance.

25. Farm machinery companies are among the foremost in the advancement of technological improvements in agriculture. The ultimate price of this advancement has been placed squarely on the shoulders of farmers as a group, who must pay the cost, not only in terms of the higher input the technological advance may represent, but in contributing to increased output, the reaction on price may result in a final lower net return, forcing some out of agriculture altogether and others into subsistence.

Administered Prices vs. Market Prices

26. In emphasizing the broader approach to the consideration of the effect of farm implement prices in relation to the declining purchasing power of the farmer, we do not overlook the disproportionate rise in the cost of farm machinery in compounding the "cost-price squeeze" to the farmer.

27. The rising price of farm machinery has, on the one hand, come as a result of the application of an administered price by the industry, and on the other hand as a result of a market price as applied to the sale of farm products. The farmer reaps the disadvantage of both systems.

28. Chairman Estes Kefauver of the sub-committee on anti-trust and monopoly of the United States Senate stated on the subject of administered prices—and as this is a short note I shall probably read it because it is relevant—

With the passage of time, administered prices have become more and more important in our economy. This has been partly due to the changing composition of the country from a predominantly agricultural to a predominantly industrial economy.

29. Dr. Gardiner C. Means, an economist for the United States government committee for economic development and originator of the term "administered prices" defined it in the following manner—and I shall not read that. It is just a definition he gave of being in a position where you can add increased cost to your final prices, and which he illustrated as compared to market prices, as in the case of agricultural costs.

[*Editor's Note: The portion of the brief not read by Mr. Thiesson is as follows:*]

On my definition an administered price is a price set by someone, usually a producer or seller, and kept constant for a period of time for a series of transactions. The opposite of an administered price is a market price—a price that fluctuates on the basis of supply and demand as these forces are felt in the market.

The prices of wheat or cotton in the central market are market and not administered prices. They constantly adjust to equate to supply and demand. It is a coincidence if a series of transactions take place at identical prices.

30. Dr. Means further stated that while administered prices have become an essential part of our modern economy, we do not know enough about how they actually operate to be able to make good national policy in such economic fields as inflation, full employment and enforcement of competition.

31. It is our view that in respect to competition among farm implement companies, this is in actual fact no more than competition for sales rather than competition in price, and that as a result of high pressured promotional programs designed to draw the attention of the prospective user of farm implements, the costs to farm implement companies for advertising and design changes have been growing at a phenomenal rate and administered prices are a mechanism whereby these increased costs have been passed on to the farmer.

MR. THIESSON: I think at this point it would be fair to add that administrative prices are also a mechanism whereby the manufacturer of farm machinery or automobiles, or the manufacturer of other products, can gauge his prices on the basis of profit return to the industry and, although this is not specifically mentioned here, I think it is generally accepted.

MR. MCINTOSH: Who has accepted that explanation which you have just given?

Mr. THIESSON: On administered prices?

Mr. McINTOSH: Yes.

Mr. THIESSON: Well, this point of view on administered prices was discussed in considerable detail at the anti-trust hearings in the United States inquiring into the prices of automobiles. The formula revealed by the General Motors Corporation in setting its factory prices for automobiles was based on a certain minimum volume of production, a certain minimum number of days of operation of its plants, and that sort of thing. The corporation based its prices on that type of formula and it was tied in with administered price proposals. To continue with the brief:

32. While a farm implement company is able to pass on higher costs, the farmer has no such opportunity to pass higher costs on to the consumer in terms of his increased cost of production. He cannot raise his prices, for these prices are market-determined. The farmer must therefore shoulder the increased costs by attempting to increase output which may again have the effect of lowering the price of his ultimate product, or he may be forced to accept a lower standard of living.

Farm Opinion on Machinery Costs and Service

33. In a survey conducted among its members by the Saskatchewan farmers union and the farmers union of British Columbia, high prices of farm machinery was given as the most frequent answer to the question as to the problem which most affected the farmer in the operation of farm machinery.

34. Poor availability of repair parts was given as the second greatest difficulty, with poor local service following. Other observations given with respect to farm implement problems contained observations such as: (i) Companies change their models so often it is impossible to give service or carry parts; (ii) Repairs are too expensive and often a farmer is required to buy a complete assembly unit in order to obtain only a small part which he may require; (iii) Need for greater standardization of parts such as V-belts, sprockets and shafts, bearings and wheels, sickle knives, canvasses and reels.

35. Numerous experiences were given where lengthy delays had taken place in the obtaining of farm machinery repair parts, often on relatively new machines. In some cases the delay had necessitated the farmer hiring someone else to complete a particular operation which his machine was intended to do. It was observed that lengthy delays sometimes resulted not only from the fact that parts were unobtainable anywhere within the province, but oftentimes they were not even available from the factory.

36. The hours of service observed by many service and parts depots during the peak farming season sometimes results in serious loss of time and money to farmers. Service to farmers could be improved by providing six-day-per-week service from commencement of seeding to completion of harvesting operations.

37. We are certain the replies received by the S.F.U. and F.U.B.C. from its membership will correspond to the experiences and knowledge of those members of this committee who are also practising farmers.

38. While some provincial governments have provided legislation requiring machine companies to stock repair parts on lines of farm machinery sometimes as old as ten years; this has not, in fact, proven to be an entirely effective method of providing farmers with the type of service required.

With an increasing frequency of model changes, the rate of obsolescence has increased, making it much more difficult for local dealers to provide proper repair service because of the need for higher inventories. As a result many local dealers are losing their agencies and farmers must go greater distances for machinery service. The main branch offices of the industry itself often do not maintain adequate stocks.

39. We note with interest an observation made by the Saskatchewan agricultural machinery administration in its second annual report, when it stated as follows:

The manufacturers continue to produce an ever-wider range of models and sizes of equipment to suit the farmers' needs. While this has its desirable aspects, it is also evident that this creates definite problems from a repair supply point of view. The rapid change of models speeds up the rate of obsolescence, and this, coupled with increasing range of models and also the increased complexity of machines offered for sale, necessitates an increase in repair inventories at distributor and local level. The repair situation has made it imperative that some of the larger manufacturers re-assess their repair distribution in stock and practices and apply modern electronic equipment to central inventory control. This transition has resulted in some temporary problems but augurs well for improved service in the near future.

Investment Factors in Farm Machinery

40. In a paper entitled, "Cost of Farm Machinery"*, James Vermeer and Donald T. Black state that the largest single item of expenditure on many farms in the United States is the cost of owning and operating farm machinery. Because of the similarity of farm machinery prices in the United States and Canada we believe the observations they make with respect to a survey of U.S. farms can be closely applied to the Canadian scene.

41. It was found that while the range in value of farm machinery as between individual farmers was quite broad, it averaged about \$6,600 at current value. They estimated that the original purchase price probably was about twice as great, and that in terms of 1960 prices it would require an investment of \$15,000 to \$17,000 to replace the equipment on the particular farms reviewed in their study.

42. While they conceded that many of the improvements in machines perform more effectively the job for which the machines were designed or reduce the heavy physical labour required of farm workers, costs of owning and frequently costs of operating the machinery have consistently risen. At the same time, improved machines have contributed to greater output, and machinery costs per unit of product have risen less than the total machinery costs.

43. While a machine of larger capacity may enable a family farm to reduce expenditures on hired labour, Charles Schwartz† notes:

With nearly all the farm labour now being supplied by the farm operator and his family this means that in a period of declining demand for farm products, the farm operator cannot save on his out-of-pocket or casual expenses by cutting down on the amount of hired labour.

* United States Department of Agriculture Year Book 1960, "Power to Produce".

† The Search for Stability—McClelland Stewart Ltd., 1959.

44. In comparing rates of depreciation and obsolescence, Vermeer and Black note that depreciation is classified usually as a fixed cost, and as long as the rate of obsolescence exceeds the rate at which the machine wears out this is a proper classification. However, if a machine is used so much that it is worn out before it becomes obsolete, depreciation becomes a variable cost.

45. It is our contention that under modern conditions, farm machinery companies now offer machines of a rated capacity that more frequently exceeds full justifiable use on the average-sized farm. Thus, if a machine is used less in each year than its practical rate of depreciation it will become obsolete before it is worn out and the original cost will be charged off in any event when the machine is replaced.

46. Vermeer and Black add that associated with the greater capacity of machines has been the demand for more land to increase the size of farms so as to provide more work per machine. Greater demand for land has, in turn, led to higher prices for land. This is an indirect cost of owning larger machines.

47. In this way, farm machinery companies have been contributing directly towards the cost-price squeeze of the average farmer by marketing farm implements of which the rate of obsolescence exceeds the rate of depreciation, thereby increasing his unit cost of output. Further, in circumstances of poor availability of parts, the obsolescence factor forces farmers to purchase new machines before the condition of the old machines may fully justify this act.

48. Thus, while it is a popularly accepted concept that the farmer must continually adjust his operations to fulfill the efficient working capacity of his machinery, it is a philosophy which our organization rejects, because this concept disregards human values and applies economic determinism as the prime yardstick in agriculture.

49. Advertising and promotion engaged in by farm machinery companies emphasize the power and capacity of machines, thereby creating an image of the need for bigness and expansion in farm size. Farm people are oversold in believing they need larger capacity machines than may be really economically sound. Thus pressure is increased to enlarge the size of farms to match the appetite of machines, not to discount the added luxury connotations and benefits derived from two-tone paint jobs and streamlining of models. Less and less attempt is being made to meet the functional farm machinery requirements of the smaller size farmer.

50. Vermeer and Black note that one way to reduce cost of machinery is to develop cheaper machines that will perform the same volume of work as the machines now in use. They comment that perhaps too little emphasis has been given to this aspect of machine design in order to reduce fixed costs or the costs of owning them. The new models would need to be sold for less money than their predecessors.

51. A further method suggested is the design and use of multi-purpose machines serving to hold down the fixed costs of machinery for the farm. Tillage and harvesting machines are cited as examples.

Role of Co-operation

52. In the area of reducing the costs of operating farm equipment the co-operative ownership of farm machinery can undoubtedly play a useful role.

53. Because harvesting machines require relatively large investments and are used only a few days a year, they are the ones most frequently owned

co-operatively. However, for co-operative ownership to be successful, stability of tenure of operators is highly desirable and the timing of the use of machines on the co-operating farms also requires planning, not only in exchange of work but in planning the seeding of various types of crops and rates of maturity.

54. Co-operative farming, requiring a pooling of all capital and human resources, represents a further effective means of lowering the cost of farm machinery and unit cost of production. However, in this type of operation because of the high degree of human element involved a special type of philosophy is demanded in order to assure compatibility in arriving at administrative and managerial decisions.

55. The co-operative selling of farm machinery is also an effective means of lowering the unit costs of farm machinery to individual producers. The Cockshutt Farm Equipment Company has, since 1945, turned out a portion of its production to the Canadian Co-operative Implements Limited which, in turn, has sold it to farmers through their own outlets under the Co-op brand name. In addition, C.C.I.L. have themselves, to a limited extent, gone into implement production.

56. W. G. Phillips*, in a paper delivered to the Canadian agricultural economics society annual meeting held in Winnipeg in August, 1958, stated:

Despite the importance of co-operative selling in some areas, it appears still to be insignificantly small in the total market. There is no doubt that co-operative selling of farm machinery can mean real economies. Just as real, however, are the difficulties which have restricted its volume in the past and may continue to do so in the future. These difficulties reflect the peculiarities of the market itself. There are, for example, the problems of credit, servicing and trade-ins that may or may not be true, as many in the implement industry ruefully suggest that that industry has for so long babied the farmer in these respects that he now expects greater patronization from implement sellers than from any others. It does seem true that farmers do not buy machinery as they buy other commodities. They have become accustomed to having their machinery sold to them. Thus many sales methods and practices which are clearly dispensable in the selling of most goods have come to be considered essential in the sale of farm machinery until the usual economies of co-operative sale are extremely difficult to obtain. It would seem, therefore, that a long-standing mode of thought among farmers must be changed before large-scale success can come within reach of the implement selling co-operatives.

57. We believe Phillips' observations with respect to co-operative sales of farm machinery need no further comment other than to point out that in the three prairies provinces, in which C.C.I.L. is established, total sales in 1959 were \$4,277,143 out of a total farm implement and parts sales potential for the year of \$170,255,210 or about 2.7% of the total market.

58. A somewhat different approach has been taken by the Co-opérative Fédérée of Quebec in the distribution of farm machinery. Unlike C.C.I.L. on the prairies, the Co-opérative Fédérée has established itself as the exclusive distributor for the Oliver line of farm equipment in the province of Quebec. Thus, it is not required to compete against Oliver agents who would handle the same line of machinery as the co-operative, as is the case with C.C.I.L. in its competition against Cockshutt. Neither has it considered it economical to enter into the manufacturing field, primarily due to the fact of the smaller

* Assumption University of Windsor.

volume potential of farm implement sales within that province. Where C.C.I.L. has proceeded on a philosophy of providing the greatest return in savings to the purchasers of farm machinery, Co-opérative Fédérée has established its farm implement program predicated on first providing its members with the best possible service obtainable. Thus it has advanced on the promotion of a vigorous sales and training program for managers and service men. While its patronage dividends to members have not been as spectacular as those paid by C.C.I.L. in its best years of operation, Co-opérative Fédérée has rendered a valuable service to its members by providing them with reasonable service and parts facilities. The result of this approach is that during its ten years of operation in the farm distribution field in Quebec, it has captured 20% of the total farm equipment sales out of a potential market averaging \$30 million per year.

Rental of Farm Machinery

59. A more recent innovation in the farm implement business has been the leasing of equipment to farmers undertaken by some farm machinery dealers. Renting machinery instead of owning it may, in certain circumstances, enable farmers to avoid investment in expensive equipment. If a job can be completed within the time limit of the rental agreement the farmer has the same control over the time and the way the job will be done as he would have if he owned the equipment. However, under unfavorable conditions or adverse weather, the lease may expire before the job is done. If the lease cannot be renewed, the loss of crop or failure to get the job done on time may be greater than all the costs of ownership. Also, because of unfavourable weather the farmer might have to pay rent on a machine without being able to use it.

60. Phillips reports that the leading manufacturers are generally opposed to the rental idea mainly on ideological grounds, although all have made provision for adopting their agreements currently used in renting industrial machinery to farm equipment and stand ready to do so if competitive conditions make it necessary. But, he states, each of the leading companies claims it will not be the first one to make such a move.

Testing of Farm Implements

61. Farmers are often confronted with problems that result from the purchase of farm machinery that may not be the best suited to a particular farming condition, or may have basic faults in its initial construction.

62. Towards the end of protecting the primary producer in the purchase of farm equipment, the government of Saskatchewan has established the agricultural machinery administration which has the responsibility of implementing the provisions of the Agricultural Machinery Act. Basically the administration is organized into two groups—an active administration group and a machinery testing group. The work of the two groups is directed towards the fundamental problems of farm machinery purchase and use and towards these ends specific objectives have been set out as follows:

- (1) To improve the availability of repairs and service to Saskatchewan purchasers of farm implements.
- (2) To ensure that at least one major source of repair parts is available in Saskatchewan for each line of implements sold.
- (3) To publicize certain portions of the Agricultural Machinery Act in order that purchasers of machines will be familiar with the remedies which are available to them.
- (4) To provide an investigational service into complaints arising out of the sale and operation of farm implements.

- (5) To test and publish reports on machines being sold in Saskatchewan.
- (6) To enter into arrangements with manufacturers for the testing of prototype machines where it is apparent that the machines in question are likely to be offered for sale in the Saskatchewan market.

63. While the results of the work being undertaken by A.M.A. have not been instantaneous in achieving its objectives, its services are beginning to show promise of value in rendering an important service to farm people by providing them with basic information on various lines of farm equipment and guiding them in the proper choice of machinery for their own farming operations.

The Role of Credit

64. The role of farm credit in farm mechanization cannot be overlooked. The Farm Improvement Loans Act of 1945 has made an important contribution in assisting farm people to improve the efficiency of farm operations. In the period 1945-1958 more than 620,000 loans representing 85% of total loans and more than \$710 million were made to farmers for the purchase of farm implements. It has played a vital role in the orderly transition to mechanized farming.

65. Within recent years, credit restrictions have been placed by banks on the extension of farm improvement loans, reputedly because of rising interest rates that have made the 5% rates under the F.I.L.A. less profitable.

66. As a result, farm implement companies have entered into the field of financing farm implement sales at much higher interest rates than prevail under the F.I.L.A. Rates approaching 10% are not uncommon. One contract that has come to our attention will cost the farmer 24%.

67. Finance companies which have previously shunned the farm financing field are now also loaming money for purchase of farm implements, and are known to make arrangements to return a portion of the interest charges to machine agents who channel deals to them.

68. Farmers can no longer farm without machinery. High interest charges are an important cost factor in farm production. We believe it would be regrettable if finance companies are permitted to gain a stranglehold on the future economic welfare of farm people. The trend in financing of farm implements bears strong implications for the future welfare of farmers. We urge this committee to closely examine this important facet of farm machinery costs.

Tariffs

69. Isolated instances have come to our attention of high rates of duty calculated on importation of second-hand farm machinery from the U.S. on the basis of a valuation provided by Section 38(b)(ii) of the Customs Act.

70. Members will be familiar with the terms and method of application of this duty as described by Mr. D. W. McGill, director, Department of National Revenue, appraisers branch, in evidence before this committee on July 19, 1960.

71. We believe the imposition of this section is entirely out of line and is used only as a comfort to farm machinery dealers in Canada.

72. It is our belief that the Customs Act was so designed as to allow new farm machinery imports from the United States into Canada duty free in order that Canadian producers would not be burdened by increased costs of production. To be consistent, the same principle should apply to the isolated instances of importation of second-hand equipment.

73. We also draw your attention to a reported suggestion made recently by an official of the Ontario retail farm equipment dealers association of the need to "do something" for the Canadian industry by placing levies on imported farm equipment which would, in turn, be used to finance support programs for the domestic industry.

74. We strongly recommend that this committee give no comfort to any such or similar suggestions which might be advanced by the industry or its allied representatives.

Conclusions and Recommendations

75. (1) In considering recommendations on the problem before your committee, we believe that many of the findings of the special committee of the house of commons which studied this same question in 1937 still hold true today. At that time, the committee concluded, among other things

- (a) That the companies engaged in the industry over the period of their operations as a whole have made substantial profits on the capital investment of the company;
- (b) That in the farm implement industry there is competition in the matter of sales but little effective competition in the matter of price;
- (c) That the profits to the farm implement companies on the sale of replacement parts are excessive and that the price of these to the consumer should be materially reduced;
- (d) That over a sustained period of time the retail prices of farm implements have been maintained at a too high level as shown by the financial returns to the companies engaged in the industry during that period;
- (e) That the companies themselves should make every effort to reduce those costs to the farmers;
- (f) To reduce these costs, more farmers should be encouraged to organize for the cooperative distribution and servicing of farm implements.

76. (2) In addition, because of the major technological revolution taking place in agriculture, rapid acceleration in model changes of farm equipment is, through obsolescence and administered pricing, making it exceedingly difficult for the average farmer to realize any substantial gains from the latest technological developments being employed today in agriculture.

77. Farm machinery companies are thus very materially contributing towards the cost-price squeeze of the family farm, with the result that many who are not able to stand the pace of modern technological developments are being forced into subsistence levels of living with untold cost to human and land resources, and in many cases are being forced out of agriculture entirely, which, in a period of economic recession is materially adding to this nation's employment problems.

78. (3) We believe the rate of planned obsolescence in modern-day farm equipment is many times greater than it was twenty-five years ago and is gravely compounding the difficulties of farmers in obtaining the proper service in the maintenance of their farm equipment, causing serious loss of time and money during crucial periods in the farm production cycle.

79. (4) We strongly recommend that this committee give serious consideration to the over-all effects of administered prices in the field of farm machinery, and that during the period of such studies no further price increases of farm equipment be imposed, thereby preventing further increases in the farmer's cost of production.

80. (5) We recommend that this committee consider the declining prices of farm commodities in relation to the purchasing power of the producer, and its effect on the economy as a whole in terms of unemployment and abuse of land resources, and that farm policies be implemented so that the average farmer may obtain a fairer share of the national income and a just and equitable price on the fruits of his production.

81. (6) Because of rising farm investment factors in farm machinery, machine companies should reduce costs of farm machinery and repair parts through manufacture of lower priced farm equipment designed to meet the need of the average farmer and the standardization within the industry of basic farm machinery parts.

82. (7) We urge the committee closely examine the effects to the farmers of high credit costs on programs conducted by farm implement and finance companies in farm machinery sales.

83. (8) No bids for increased tariffs or similar protection for farm machinery companies should be entertained and the present methods of valuation on imports of second-hand farm implements from the United States be discontinued.

All of which is respectfully submitted.

The CHAIRMAN: Thank you very much, Mr. Thiesson.

Mr. HORNER (*Acadia*): First of all I would like to say that there is quite a lot in the brief, and I have one or two questions that I would like to ask. I also wish to compliment the authors of the brief in putting it into clause form and numbering the clauses. It is much easier to question in that way. That is what we are here for, to arrive at some reason as to why farm machinery costs have gone up. The first eleven pages of this brief deal more or less with an introduction as to the reason for this study, and it has been this committee's policy to try to establish figures and facts on a sound premise. This has already been evident in reports, and my first question stems from this thought. On page 2 of the brief, under clause 5, the statement is made:

The general trend of agricultural prices has been downwards since 1951.

I would like to question Mr. Thiesson on that, but before I do so I would like to give him what I am going to question him from, namely the index number of farm prices and agricultural products. I would like him to look at this document before I question him.

If he will notice—this is put out by the dominion bureau of statistics, catalogue No. 62003—the index for farm prices in 1950 was 260. It rose in 1951 to 296 and from 296 it declined fairly rapidly and continually until 1957. Then, in 1958 a substantial increase, in 1959 a continued increase, and in 1960 a slight slump from 1959, but still above the previous low of 1957. So, in looking at that list of figures, Mr. Thiesson, would you not agree that the general trend of agricultural prices has been downward since 1951 up until 1957, but the general trend has gone the other way since then?

Mr. THIESSON: No, I would not say that the trend since 1957 has been upwards. The index, if you would care to look at it for 1957, is 234.2 and the average in 1960 239.4. In relation to farm implement costs, your highest cost

of farm implements is in the production of field crops and grain, and I do not think that you can note an increase in the price of grain production which is most closely or directly associated—

Mr. HORNER (*Acadia*): I have a supplementary question along that thought. If you look at Saskatchewan on that same chart I handed you, you will note that 1954 was 208, 1955 was 203, 1956 was 208, 1957 was 201, 1958 was 214, 1959 was 210.

The average for 1959 was 213.

Mr. THIESSON: But for 1960—

Mr. HORNER (*Acadia*): What I am getting at is that the general trend is reversed. It is downward from 1951 until 1957. It may have improved in 1952. Whether that trend will be sustained or not is another thing.

Mr. THIESSON: Mr. Horner, with all respect, the index figure for 1951 is 206.8, and it dropped in 1952 by 22.4 points.

Mr. HORNER (*Acadia*): Why was there that drop, in your opinion, seeing that you are taking 1951, the highest of the past 12 years?

Mr. THOMPSON: This was a peak. I did recognize it as a peak.

Mr. HORNER (*Acadia*): Let me explain to you why it was.

Mr. THIESSON: I know why it was.

Mr. HORNER (*Acadia*): It was largely because of the higher demand for Canadian cattle in America which caused our cattle to go up from 36 to 38 cents. This caused the price index to drop.

Mr. THIESSON: It dropped nevertheless.

Mr. HORNER (*Acadia*): It dropped in 1952 through no fault of this government, or the government at that time.

Mr. THIESSON: It is not a question of blaming the government or anyone else.

Mr. HORNER (*Acadia*): There is another question on the same line. Do you not feel that in figuring out the price index trend it would be better if you worked on an average rather than accept a high period figure for a given year. I know—and I wonder if you have checked the figures—that in averaging the last three years preceding the low peak that is 1955, 1956 and 1957, and averaging the next three years, that is 1958, 1959 and 1960, the index price has increased five per cent.

Mr. McINTOSH: I have a question—

The CHAIRMAN: Just a moment.

Mr. McINTOSH: This is on the same question, to save further argument. Have we figures on grain alone, and leave livestock alone?

Mr. HORNER (*Acadia*): They are saying here, Jack that the general trend of agricultural prices has been downward since 1951 and in order to establish on a firm ground the findings or the work of this committee, I say the trend has not been so, and I produced figures to prove there has not been a trend downward since 1951. This trend was held. They go on to say in clause 7 that farm machinery prices have doubled since 1940. If one looks at page 53 of the proceedings, he notices that farm machinery costs are two and a half times what they were in 1940, and that in the last five years farm machinery costs have increased 25 per cent. That is the reason. We have held the downward price trend on agricultural goods, but we have not held the continuing increase in farm machinery costs—and that is the reason for this committee as I see it.

Mr. USICK: I would like to ask this question. If the general trend is not downward—the honourable member mentioned that in 1958-59 it was from

the previous decline—to what, then, does he attribute the 1960 position which is the last, for the year just completed, where the trend was down in some cases, where it was substantially down in some individual provinces for that period. My position would be this, that if you use 1951 this is the peak, but the average low prices were started in 1954 and there has been little or no improvement from 1954 to the present time.

Mr. HORNER (*Acadia*): There has been a five per cent improvement.

Mr. USICK: Just look at the figures. The 1954 figure for all Canada was 236.9. The average last year was 239.4. That is an improvement of just one per cent. So the general trend since 1954 up until now has been hardly changed.

Mr. HORNER (*Acadia*): If you take one year here and another year there, as a proper way of making a comparison of price trend, you may get anything.

Mr. THIESSON: I think, Mr. Horner, you cannot assess the general trend—

Mr. HORNER (*Acadia*): Without taking a few years.

Mr. THIESSON: —by picking out just an isolated index. The circumstances over the past ten years, the economic circumstances in agriculture, the demand for farm products has been such that there have been no factors on the export market that have tended to bring a general trend towards an upward movement in farm prices. In respect to export sales of grain there has been no general trend in economic factors that has brought any indication of a rise in price in terms of grains on the export market. In respect to export sales of livestock to the United States there have been short-term fluctuations in terms of an increase in cattle prices, an increase in hog prices, and they have been associated with declines; but in terms of a general trend, as we said here, there has been no evidence to indicate that there is a wide sweep upward.

Mr. HORNER (*Acadia*): You are the person using specific agricultural arguments. This is an agricultural farm union and I am taking these index figures. These index figures take in all agricultural products. I drew a line across the chart and the increase went up in 1958 across Canada in all provinces, and 1959—

Mr. THIESSON: This is a matter of interpretation; the way I interpret a general trend appears to be different.

Mr. HORNER (*Acadia*): I am drawing a graph. You say the trend went down from the high peak and you assume it will go further. It is not fair to take a high peak, or take any one year.

Mr. ARGUE: I wonder if the two antagonists would agree with this—I am not trying to get into a quarrel—that farm machinery prices even on this index figure appear to go up.

Mr. HORNER (*Acadia*): That is what I said, that for the last five years farm machinery prices have gone up 25 per cent; but I am saying again that the facts do not bear out this statement that the general trend of agricultural prices has been down since 1951.

Mr. MONTGOMERY: I think that is plain to everyone, and that is the truth of it. We are not here to discuss farm prices, but the cost of farm machinery.

The CHAIRMAN: Would members speak one at a time, please. I ask this so that the *Hansard* reporters may be able to get this down.

Mr. MONTGOMERY: Section 5 is not true. Everyone knows that who knows anything about farming.

Mr. HORNER (*Acadia*): I do not want to prolong this. I want to leave clause 5 and go on to clause 6, which says:

As a result of the decline in farm net income, Canadian agriculture is in a state of depression. Thus, while a 20 per cent decline has taken place in the index of farm prices between the years 1951 and 1960,—

I will stop there. In figuring it out—and my arithmetic is not so poor that I cannot figure more accurately than that—I make it that the decline from 1951 to 1960 is 18 per cent, if one wants to use the high peak of 1951. Mr. Thiesson agreed that one year was poor. Actually if we go back ten years the decrease from 1950 until 1957 was ten per cent. The increase from 1957 to 1960 was 2.15 per cent. That is more or less a different trend than this twenty per cent decline. I want to see whether or not Mr. Thiesson would agree with that.

Mr. THIESSON: It depends on what you are basing your percentage.

Mr. HORNER (*Acadia*): On the index number of farm prices of agricultural products; 1935 to 1939 equals one hundred.

Mr. USICK: Possibly we might make some progress here and come to an agreement on the question of prices if, rather than using the high period of 1951, or some of the low periods since that time, we take a look instead at the average of the past number of years when we have had the low prices and the two years, for example, 1958 and 1959, when there was an upturn which went down again in 1960.

Mr. HORNER (*Acadia*): It never went down. 1960 is still above the previous four years.

Mr. ARGUE: I think the common courtesy would be to let the witness make his statement uninterrupted and then Mr. Horner could make his statement uninterrupted.

Mr. USICK: Perhaps I might finish. 1954 was the main downward trend in prices of agricultural commodities. 1954 was 236.8 on the chart which Mr. Horner has given us as an average of farm prices until the present time. As I have been sitting here I have taken an average of the last seven years. The average is 238.3 for the last seven years. Last year, 1960, it was 239.4 which is an increase over the average of the last seven years. The prices in the last seven years, on the average, have been almost unchanged. That average has remained fairly constant at 238.3.

Mr. HORNER (*Acadia*): If you had had that in your brief I would not have questioned it; but when you said that the general trend is down from 1951 I looked for the low between now and then to see if I could find any substantial decrease. There has been a substantial increase since 1957. 1958 was higher than the four years previous, also 1959; and 1960 is higher than the four years before 1957. The trend has reversed. Would you agree that the average of the last three years has been an increase over the preceding three years leading to 1957.

Mr. USICK: I would agree that the average has been higher, but the trend—

Mr. HORNER (*Acadia*): In other words the trend has been reversed.

Mr. USICK: Not necessarily.

Mr. ARGUE: Farmers are still in a hell of a mess; I don't care how you interpret this.

Mr. HORNER (*Acadia*): I question this twenty per cent quite severely and I wonder if Mr. Thiesson could show us the figures. I showed where I arrived at my eighteen per cent, using the high peak of 1951. Could he show us the figures for the twenty per cent?

Mr. THIESSON: I got my figures from the same source you did. I have them right here. It is the same source you quoted. It is a division of interpretation.

Mr. HORNER (*Acadia*): I would suggest this be tabled in the proceedings so that some people after reading the minutes would realize what we were talking about.

The CHAIRMAN: Is that agreeable?

Agreed.

(See appendix)

Mr. McINTOSH: I would like to make a suggestion in respect of percentages. You can use the same table and make it fit your argument. I am thinking right now of a suggestion we had that about twenty-one per cent of the farmers are getting less than \$1200 gross income. Seventy-eight per cent of the farmers in Newfoundland get less than \$1200. Four per cent in Saskatchewan get less than \$1200, but it does not prove anything.

This reminds me of the story of the executive who sent his secretary to get some statistics which he could use for a speech he was about to make. She came back and said that it would take five years to get the figures. He said forget about them. He went ahead and made his speech using fantastic figures, and was applauded. When he came back his secretary congratulated him and said "It was a wonderful speech. Where did you get those figures which it would have taken me five years to get?" He replied "I just made them up. Anyone who wants to disagree with them will take five years to do so."

I think we are in the same position right now. These figures do not mean anything. There is no reference in the brief as to where these are taken from. I suggest we go on.

Mr. ARGUE: Mr. Chairman, I have three or four questions. I would like to have a comment from the farmers union witnesses as to how much they think dealership mark-ups are excessive or adding unduly to the cost of distributing farm machinery. Before they reply, I would like to say that the Canadian federation of agriculture seemed to put a great deal of emphasis on their contention that there are too many dealers and that a great deal of the problem lay in the retail outlets. My own view, for what it is worth, is that the dealers make a very tiny profit. They are not the culprits in any way, shape or form. Although their margins may look large on the surface, they are very largely eaten up by paying substantial prices for trade-ins and so on. I would like to try to get the opinion of the farmers union as to what proportion of the farm implement price about which they are objecting might be attributed to large mark-ups by dealers, or inefficient dealerships.

Mr. THIESSON: Well, there is a trend, of course, in dealerships, of which the committee is probably aware. I think there is a general reorganization taking place in the number of dealerships that the companies have. This is being contributed to by a number of things. As the actual number of farms reduces it means that a dealer in a community will have a declining number of farmers to service. As a number of new model changes take place, it means that much more difficulty for an implement dealer to maintain an adequate stock of repair parts and requires a higher capitalization on his part to stock adequate repair stocks and to give service. I do not think there is any doubt that the mark-up that dealers have is substantial.

Mr. ARGUE: Do you know what it is?

Mr. THIESSON: I have heard figures mentioned which run to about twenty five per cent.

Mr. ARGUE: The dealers,—or at least one dealer, who is a member of parliament,—say it is fifteen per cent.

Mr. THIESSON: No. I think it is higher.

Mr. HORNER (*Acadia*): We can establish this fact when the implement companies come before us.

Mr. THIESSON: There is another aspect about this. I think the farm implement dealer is under pressure to make sales. He is put very much in the class of the car dealer. I think he has been described as an errant rug pedlar in as

much as he is dickering for sales and may allow a higher trade-in value on an old machine than it is actually worth. So to set the net to that dealer is difficult to arrive at.

Mr. ARGUE: My point is this; do you feel that in terms of profit margins of the dealers, as related to their net cost—I am not talking about a mark-up, because a mark-up is on cost—do you think very substantial savings can be made?

Mr. MCINTOSH: What do you mean by net cost?

Mr. ARGUE: Net profit. It is all right to say that a dealer gets 15, 20, or 25 per cent mark-up. But business people know it is the case that you are going to take in trade-ins, and that the companies will load a lot of repair parts on you, and pressure you into making sales. Therefore I suggest the implement dealer is just as much a victim of the implement companies as is the farmer.

Mr. TARDIF: Except that the cost of operation of different dealers is not the same; the overhead of some dealers will be much higher than that of others, and that will affect their net profits.

Mr. ARGUE: That is correct, but I would like the witness to give us his comments on whether or not, in his opinion, dealers are making large profits, and that is where we should be directing our attention. Personally, I do not think it is true, but I would like the witness to give us his own opinion, and we will respect it.

Mr. THIESSON: My opinion is similar to yours, Mr. Argue. I do not think there are too many dealers making too high profits. I do not think this actually exists, because they are under extreme pressure from the manufacturer to take on more machinery, probably, than they feel they are prepared to sell in the community.

I know this, because I have had relatives in the farm implement business, and this is what they have told me; and it is a matter also of having to stock up on parts.

Mr. USICK: Mr. Chairman, in answer to Mr. Argue's question I might say that there is definitely a trend among implement companies to reduce the number of dealers, and to attempt to get these dealers to lower the amount of discount which they allow the farmer, to lower the amount allowed on trade-in machines, and to charge the farmer a higher price.

In those areas in the province where they have reduced the number of dealers, where there are fewer dealers, the farmer has to pay a higher price because he does not get as large a discount as the dealer would normally receive.

Mr. DOUCETT: There are fewer dealers for the farmer to blame.

Mr. USICK: You may look at it in that way, but we have found it to be that wherever there are many dealers, there is more competition, and the farmer will get a better value for his implement, or a lower price in the cash payment.

The trend of the companies is to reduce the number of dealers and thereby reduce the amount of competition, which would mean an increase in the price to the farmer.

But there seems to be perhaps one contradiction in this, and that is that in those areas where there is greater competition, the block man who is acting for a certain company that does not want to lose a particular deal to another dealer—particularly to a dealer who may be just at the point of hardly being able to survive in that area—that block man, in trying to conclude a deal with a farmer, will often reduce the percentage of allowance that he is allowed over and above the dealer's trade in, and try to make that sale in that area. This practice has put some dealers out of business.

Mr. ARGUE: I have some further questions.

Mr. McINTOSH: May I ask, for information, if Mr. Usick and Mr. Thiesson are both farmers?

Mr. USICK: Mr. Thiesson is secretary of the Saskatchewan farmers union. I am a farmer, and I am president of the Manitoba farmers union.

Mr. ARGUE: What type of machinery do you use?

Mr. USICK: On our farm we have International Harvester Company machines, also John Deere, and Massey-Harris machines. I have a brother-in-law who is a Massey-Harris dealer.

The CHAIRMAN: It is now about five minutes to eleven. This clock, I believe, is slow.

Since your chairman and also the vice-chairmen must be unavoidably absent this afternoon, we have asked Mr. Forbes if he would assume the chair. I hope the committee will be agreeable to the suggestion, but I believe a motion is necessary? Is it agreed?

Agreed.

When you return this afternoon, we would ask you as much as possible to assume the same seating arrangement as this morning. The reporting staff has three new members, and this would facilitate their getting the proceedings attributed to the right person.

Mr. TARDIF: What was the motion?

The CHAIRMAN: The motion was that Mr. Forbes act as chairman of this afternoon's meeting.

Mr. TARDIF: I see.

The meeting adjourned until 2:30 p.m.

AFTERNOON SESSION

FRIDAY, April 21, 1961.
2.30 p.m.

The ACTING CHAIRMAN (*Mr. Forbes*): Gentlemen, if you will come to order we shall get the afternoon session under way and, before we proceed with the brief, I have an announcement to make, that the Canadian congress of labour are unable to appear on Monday and have been re-scheduled to appear at our meeting on May 29. Accordingly, there will be no meetings of this committee next week.

Mr. HORNER (*Acadia*): All of next week, Mr. Chairman?

The ACTING CHAIRMAN (*Mr. Forbes*): Yes, according to this. Now, Mr. Thiesson has a comment to make.

Mr. THIESSON: Before we begin the afternoon session I should like to say that our approach in our presentation here has been, with respect, not trying to assess the blame in this particular subject on any particular segment of the economy but to try and analyze, as objectively as possible, and on as broad a scale as possible, the whole problem. This morning there was some discussion with particular reference to paragraphs 5 and 6 in our brief, and I should like to ask Mr. Horner to lend me his 1960 year book for a moment. By quoting from it, it may help clear up our particular approach on this question.

In the initial stages of our brief it has been our purpose to try and outline, as broadly as possible, the farm picture as it is seen by us and by others as well, and in paragraph 5, page 438 of the year book the following is stated:

The general trend of agricultural prices has been downward since 1951 while there have been upward trends in non-agricultural prices,

in consumer incomes and in business investments. The costs of goods and services required by farmers have increased while agricultural prices have not, which has put the farmers into a situation described as a "cost-price squeeze". As a result of the decline in farmers' net income, Canadian agriculture, in contrast with the buoyant prosperity of many other industries, is in a state of depression. For several reasons it is much more difficult for farmers to move to other lines of work than it is for those in other industries to change their occupations.

With regard to the figure of 20 per cent, if you work it out by actual mathematical division it comes to 19.3 per cent. I have chosen to round it out for the purposes of general outline, and that was my only intent. I want to bring this to the attention of the committee because I feel that, to some extent, the integrity of our organization has been questioned. I have been mainly responsible for the preparation of our brief and I do not want to leave that impression on the record.

Mr. HORNER (*Acadia*): Personally I should like to thank Mr. Thiesson for explaining where he got those viewpoints. I argued with him that the percentage which he quoted should be 18 per cent. He said it was 20 per cent, and so we shall split the difference and call it 19 per cent. The point I was trying to make was that, of course, you are dealing in general trends, and to some extent Mr. Thiesson agreed with me. Therefore, I am prepared to let the matter drop.

The ACTING CHAIRMAN (*Mr. Forbes*): The first 11 pages of the brief are merely a preamble to the subject under discussion. Would the committee agree to pass it and get into the heart of the matter?

Mr. ARGUE: Last time we had the federation of agriculture here they went through their brief, very much as Mr. Thiesson has done this morning, and then we were allowed to ask questions on the brief as a whole. I have a couple more questions which I should like to ask. You will remember that I had the floor this morning when I had to go into the house.

The ACTING CHAIRMAN (*Mr. Forbes*): Would your questions concern this portion of the brief only?

Mr. ARGUE: They would come in on this part. I would like to put these questions, and I think it is just as convenient a way as doing it section by section.

The ACTING CHAIRMAN (*Mr. Forbes*): That is what I meant—to do it section by section.

Mr. ARGUE: I have these two questions—

The ACTING CHAIRMAN (*Mr. Forbes*): In other words, you want to make a brief statement before starting into the whole question?

Mr. ARGUE: No, I should like to continue my questioning until I conclude.

The ACTING CHAIRMAN (*Mr. Forbes*): All right. Proceed but do not take too long.

Mr. ARGUE: I have two areas I want to cover and I shall tell you what they are. One has to do with this thing about the 10 per cent credit, and the small loan companies getting into this field, and the other has to do with C.C.I.L. operations in the other part of the brief.

Mr. McINTOSH: Could the first one be taken up under page 22?

Mr. ARGUE: It could be taken that way but I would appreciate the opportunity of taking it this way. I was doing it this way and I intend to do it this way. We had a bill in the house last week when we were discussing high interest rates, and another one was introduced this morning. The question of high interest rates and credit has exercised the minds of members of parlia-

ment in all parties for some time, and I am going to make what I think is a correct statement, namely, that more and more members are coming to the point of view that action should be taken to do something about the high interest rates.

The ACTING CHAIRMAN (*Mr. Forbes*): Are those interest rates referred to in the brief?

Mr. ARGUE: Yes, and I view with alarm the situation set out by Mr. Thiesson. I want to say as far as I am concerned, and I think most members will agree with him, that the Farm Improvement Loans Act, with its 5 per cent interest, has been a tremendous help to agricultural producers over the years. We appreciate this legislation and we want to protect it. Now, I wonder if we can be told the names of some of these companies which are charging 10 per cent, and if we can be given any more information on the degree to which small loan companies are coming into the farm loans field. I think their coming into that field represents a very bad state of affairs and action should be taken to provide alternative means of credit at reasonable interest rates.

Mr. HORNER (*Acadia*): I have a supplementary point to that.

Mr. THIESSON: In respect to the farm implement companies that are actually in the financing field, I understand that most of the major ones are in it.

Mr. ARGUE: John Deere Company, International Harvester Company?

Mr. THIESSON: I think so. Massey-Ferguson Limited, and possibly a few of the others. J. I. Case is in it also. Finance companies that, I understand, are in it are the Industrial Acceptance Corporation, the Commercial Credit Corporation—I think it is Canada Acceptance or Commercial Acceptance Corporation, I am not sure, the initials are C.A.C. There are three of them.

Mr. ARGUE: Is the 10 per cent figure that you refer to an interest calculation, or is it a charge of 10 per cent apart from the way the payments are made? Does it include service charges, carrying charges and so on? The reason I ask that is that small loan companies might try to prove that their interest is only 10 per cent, but if you take all of their charges you get up to 20 per cent. I am wondering if this is a simple 10 per cent interest or whether this is some other type.

Mr. THIESSON: I believe that the specific information as to the amount of interest charged by different machine companies could probably best come from them. I would not want to speak authoritatively on all of their contracts. I did speak to a certain person who was in the credit department of one of the farm implement companies, and he gave me this particular information.

Mr. ARGUE: You have not examined the contract?

Mr. THIESSON: I have not seen the contracts, but he was the credit manager or the distributor in Saskatoon and he informed me that most of the machine companies were in the financing field and that the finance companies themselves were moving in this direction.

Mr. ARGUE: Industrial Acceptance is much higher than 10 per cent.

Mr. THIESSON: That is correct. In their particular case it was very near that.

Mr. FORGIE: Is that 10 per cent not an over-all figure?

Mr. HORNER (*Acadia*): I have a supplementary question on that. I wonder if Mr. Thiesson has an idea as to what percentage of farm implements sold are financed by machine companies or these other finance companies.

Mr. THIESSON: I phoned this person up and discussed this question with him. I told him I was wondering why a farmer would choose to finance the purchase of farm implements through farm machinery companies if he could get a loan at 5 per cent through the farm improvement loan. He explained it

this way, that agriculture is in a period of diversification and it is often the desire of farmers to keep open their lines of credit through the farm improvement loan for other farm improvements, such as the purchase of cattle and so on. As a result, he said, they will come to us and finance the purchase of farm machinery through the company. I asked him if they were active in this. He said yes, they were acting in this particular line of financing.

Mr. HORNER (*Acadia*): You have no ideas as to what the percentage was?

Mr. THIESSON: I did not ask him.

Mr. McINTOSH: I wonder if the interest charged by all these different implement companies is the same?

Mr. THIESSON: It is not.

Mr. McINTOSH: Could you give us some information as to how it varies?

Mr. THIESSON: In this particular case they have three levels of interest rate they charge, depending on the type of contract. He has explained that their interest rates insured a person against death and also insured machines against loss. He said that on a monthly payment it ran to 5.9 per cent on unpaid balance.

Mr. McINTOSH: Was it a matter of choice for the farmer?

Mr. THIESSON: I am speaking from memory but he said that on an equal payment plan it ran somewhere around 9.6 per cent, that is where it was paid quarterly or every six months on farm implements. He called it an equal payment plan; it ran to 9.7 per cent, and he said that a contract with a competitor calls for an interest rate of 8 per cent on the full principal for a three-year period, even though the repayments were made on an annual basis. I pointed out to him that the actual result of this would be much higher than 8 per cent and he agreed that it was.

Mr. McINTOSH: I have read this brief and I see that in your recommendations and conclusions you suggest that the farmers should act on a cooperative basis. You said earlier that there was a C.C.I.L. or co-op that offered for sale Cockshutt equipment. Do you know whether they charged the same interest or an equivalent interest to these other companies?

Mr. THIESSON: I do not know. I think the C.C.I.L. have sold it in a variety of ways—through the farm improvement loan, or a loan through the credit union, perhaps.

Mr. KORCHINSKI: Mr. Thiesson said first that he called on the farm association?

Mr. THIESSON: No, a credit manager.

Mr. KORCHINSKI: The point was that the farmers wanted to keep this line of credit open so that they could get money through the banks and through the farm improvement loan. Is it your point that they had not used up the full credit available to them? Is there not enough credit available to them, that they were put in a position where they do this?

Mr. THIESSON: It may be both. It seems to me that under the farm improvement loan if a farmer has an outstanding debt for a farm implement which he has purchased and which he is paying off, and for which perhaps he owes \$1,000—to a large extent whether a further loan is granted is at the discretion of the bank manager. I asked this particular individual whether they had gotten into this business possibly as a result of the tight money that has been prevalent in the last few years, and he said that was one of the major reasons why this step was taken, that bank credit had in fact been tightened up in extending farm improvement loans. Whether that is a valid explanation for this trend or not, I do not know.

Mr. KORCHINSKI: I have dealt with these people before, and if I have a legitimate case for borrowing money they are fairly cooperative, and have been with me and with others of whom I know. If they have reached the point where they have used up all their credit, there may be a tendency for some to take more than they can repay and bankers have got to know that. The corporations will have this money available; they are not too concerned whether the man is losing in his farming experience. They do not care how he repays; they just like to supply the equipment and after that it is the farmer's worry. It seems to me that the banker has given fair advice in that way.

I cannot understand what your attitude is here now. Would you think they have been or they have not been restricting credit too much? Would you think there was a tendency to have tight money? Is that your impression?

Mr. THIESSON: We are drawing this question to your attention because interest rates can form an important part of farm costs and if, in fact, implement agents or others are extending credit, that is, over-extending credit to the farmer by giving him this type of loan when he may have debts at the bank which make it impossible for him to repay it on the basis of what he can produce and what he can sell, then perhaps they are not actually doing him a service by doing this, because they may end up by repossessing his machine. This may, in fact, affect his future, with a farmer, because he might be forced right out of this business altogether.

During the earlier period of this century the mortgage companies had a great reputation in the financial field and a lot of them ended up with considerable blocks of land, which was later sold following the depression. This can have a similar effect on the farmer because, under modern agricultural conditions, the farmer must have farm machinery in order to farm; so the result can be the same as it was probably forty years ago.

Mr. HORNER (*Jasper-Edson*): Does your national association find that the banks have not been too co-operative in regard to farm improvement loans?

Mr. THIESSON: I would not say too much about that situation, but this was so a matter of a year or several years ago—where people have been turned down for farm improvement loans.

Mr. HORNER (*Jasper-Edson*): That the banks had cut down the credit on the farm improvement loans, by order from the head office—which I object to very much.

Mr. USICK: May I refer to the former statment by Mr. Horner in regard to the banks. In our area the Royal Bank still operates a policy where there are no farm improvement loans for more than \$3,000 to an individual farmer without the manager having to go to head office for aproval. As you know, of course, there is an over-all limit on the farm improvement loan as well. With the high cost of some machines, particularly tractors and combines, it does not take any more than one machine in some cases, two at the most, to reach the maximum.

The ACTING CHAIRMAN (*Mr. Forbes*): Thank you for that information, Mr. Usick.

Mr. HORNER (*Acadia*): On page 22 of the brief, in paragraph 65, you say that "within recent years" certain restrictions have been placed on credit. If you look at the annual report for 1959 on farm improvement loans—you will probably agree with it, Mr. Thiesson—the government amended the farm improvement loan legislation to increase the amount one could borrow under it from \$5,000 to \$7,500.

This to me is not a credit restriction: this is the reversal of credit restriction. The year 1958 you would include in your "recent years". The point I want to make is that in looking at the number of loans and the amount of

money loaned out, the amount of money loaned out in 1957 was \$69 million, according to the figures in this table. The amount loaned out after the farm improvement loan was increased in 1958 jumped to \$90 million.

In 1959 the figure is \$98 million, and it is actually higher than the amount of money loaned out under farm improvement loans in any preceding year. The number of loans made in 1957 was nearly 58,000. In 1958 this figure jumped to 70,000, and in 1959, to 71,000.

I would merely point out—and you would probably agree—that credit restrictions—although I realize that in 1959 the banks did, to some extent, place credit restrictions on farm improvement loans—but I hope you will agree that credit restrictions have not lowered the amount of loans, or the money loaned under farm improvement loans, while the amount of money loaned out under those loans has increased.

It may not have increased enough but the restrictions have not affected it. You realize what I am getting at. Actually there have been no restrictions in the overall picture, according to the figures which I read out; but the liberalization of credit may have been enough to take care of the demand.

Mr. THIESSON: I realize the role of the government in farm improvement loans, and this is not under dispute in my view. What we are trying to say is that the discretion of expanding loans under farm improvement loans often rests upon the individual bank manager, and it is as a result of the tightening up of this discretion that it has opened the field for a new area of financing which is increasing costs to the farmer in the purchase of farm equipment.

Mr. HORNER (*Acadia*): Whether the banks tightened up on money or not in 1959, the amount loaned under the Farm Improvement Loans Act was greater than ever before, and the number of loans increased also. Therefore, it is hard to see in the overall picture if you have tightened up your loans in 1959. But before that, credit restriction was, in fact, liberal. That is a word I hate to use, but for the want of a better one, I use it. My point is that you increased enough to cover the demand.

Mr. SLOGAN: I was just wondering if the farm unions had any suggestion to make as to how to alleviate this question of credit? Do they feel that credit should be expanded further, or terms of liberalization expanded further?

Mr. THIESSON: Under the farm improvement loan section, you mean?

Mr. SLOGAN: Yes.

Mr. THIESSON: Well, it is a discretionary question, it seems to me. I think that generally, bank interest rates have gone up, and if a bank can lend its capital out, all right.

Mr. MUIR (*Lisgar*): No; the bank interest rates are statutory at 6 per cent.

Mr. THIESSON: Well, interest rates generally, I think, have been increasing. I suggest that interest rates generally have gone up; and if there is a shortage of loan capital, and if the bank has discretion to loan at 6 per cent, or 5 per cent, the tendency is for them to loan at 6 per cent.

Mr. ARGUE: Are you sure of that? The assurance we are given in the house is that the banks have co-operated fully, and have not discriminated against the 5 per cent loans; and that if there is any tendency towards tight money it is something that the banks apply generally.

But if you have some evidence the banks have discriminated in their 5 per cent loans as compared to their 6 per cent loans, I would like to have it, because if the Minister of Finance were here, I am sure he would say that the banks treat everybody who comes in in the same way, whether they make a 5 per cent or a 6 per cent loan.

Mr. USICK: I would say, from our point of view in Manitoba, and from looking at this, that we cannot see where the banks discriminate between

the 5 and 6 per cent rates. The banks have taken the position since August of 1959 that they have tended to put more restrictions on all loans, even in the case of farm improvement loans. Even though there are more farm improvement loans, there is more demand for that sort of credit. Farmers need more of this type of credit.

If you look at the figures on the purchase of farm machinery in the last six years, you will find that there was a very sharp decline, and that we are not buying anywhere near the number of farm machines that we did, let us say, in the fifties. As that machinery depreciates and wears out, there is more and more demand to have it replaced, plus the demand for the newer types of machinery coming out, so that there is more demand for farm improvement loans in general.

In our area, the bank manager makes the offer to the farmer with the best credit. I mean, he is not allowed to make a farm improvement loan of more than \$3,000 in the case of an individual farmer. Once he gets beyond that figure he has to go to the head office. The result is that some farmers are turned down on their loans on any basis, so that the implement companies will tend to sell their machines to this type of people at interest rates of six, eight, ten or even a higher percentage.

Mr. SLOGAN: In the opinion of the farm unions, if interest rate is a factor, would they prefer keeping the interest rate at five per cent with the restriction it is causing now, or would they prefer to have the interest rate raised to six per cent and to have more availability of money?

Mr. ARGUE: First of all you must establish that there are fewer loans at five per cent.

Mr. THIESSON: In respect to the figures which Mr. Horner gave us for 1959, that year was a peak year in farm implement sales; it was up 29.9 per cent from 1958. It was the biggest year since 1953 in farm implement sales.

Now, as to your question as to whether farmers would want the five per cent interest increased, I do not know if I could answer it truthfully or not.

The ACTING CHAIRMAN (Mr. Forbes): Do not tell us anything that is not the truth!

Mr. THIESSON: I would not, personally, want to have interest rates increased, no.

Mr. SLOGAN: The other thing I would like to ask you is this: we have heard some spokesman for farm unions—I recall a meeting at Selkirk, where the hon. Alvin Hamilton spoke, and when the secretary of the Manitoba farmers union made a big to-do about the debt position of the farmers.

Which would you prefer to have, restrictions on credit so that the farmers would not be so much in debt, or would you favour having more credit so that the farmers could go further into debt?

Mr. THIESSON: I think the policy of the government has been established by expanding the loan limit of the farm improvement loan, and under the farm credit corporation.

Mr. SLOGAN: Do you object to that?

Mr. THIESSON: No.

Mr. USICK: Dealing with the secretary of the farm organization of Manitoba, farmers generally require liberalization of credit in order to be able to have credit available to them. However, they also require an overall agricultural program in which they are able to make enough money to pay off their debts, and so that the debts will not increase over a period of years. Otherwise they will continually increase. You can liberalize credit without necessarily increasing the debt, I mean the overall total debt. But that debt has continually increased. It is one which should be reduced, but it can only be reduced by an overall agricultural program which will reduce that debt.

The ACTING CHAIRMAN (*Mr. Forbes*): I think we are getting away from the subject of interest on farm machinery.

Mr. MCINTOSH: I would like to pass a few remarks on what Mr. Usick said a few moments ago. I think if he is not misinformed, then he has possibly misinformed the committee.

I think we have to be fair to the bankers in western Canada; and I think if he would investigate the situation, he would find that it has been known for quite a long time that the policy of the banks to restrict their managers to \$3,000 limits was applied by the head office. That is a general policy of all banks and it has been that for years. In respect of the machinery you mentioned which was purchased in the late 1940's or 1950's, this was an aftermath of the war when equipment was worn out and could not be replaced. Naturally it would be high at that time. When the farmers had sufficient machinery they would stop buying.

The CHAIRMAN: Is there anything further on interest rates on machinery?

Mr. KORCHINSKI: I was wondering whether or not the farmers union has any evidence of the effect of any particular branch or bank restricting credit more than others. Have you any evidence to substantiate any such charge, any evidence that one particular bank might be a little more lenient?

Mr. THIESSON: We have not investigated this particular aspect. What we have tried to do is draw your attention to the fact that farm implement companies are getting into the field of financing farm implements and it is costing farmers more than they can afford to pay. The interest rates charged by these companies are adding to the cost of the farm implements.

Mr. HORNER (*Jasper-Edson*): What do you think we should do about it?

Mr. THIESSON: I think we should find out from the farm implement companies, when they appear before you, to what extent they are in this business and how much money they should loan. I understand they are doing the financing themselves in some cases and not borrowing from the banks. I think we should find out how this affects the cost of farm implements to farmers, and then the recommendation is up to you.

Mr. SOUTHAM: Dealing with the amount of interest charged when buying machinery, on page 22, clause 67, there is an interesting statement. It says:

Finance companies which have previously shunned the farm financing field are now also loaning money for purchase of farm implements, and are known to make arrangements to return a portion of the interest charges to machine agents who channel deals to them.

That is quite an interesting statement. I am wondering how much evidence of this there is.

Mr. THIESSON: This is information which I received from the source I was speaking of. I regard it as reliable. He said that their particular implement agents asked them why they did not do the same; that is, the company channel back a certain percentage of their interest rate to the dealers in order that they can finance through their company rather than the finance company. To me this is an alarming thing. It can add materially a great deal to the cost if you have a nebulously worded contract that indicates on the surface a small interest rate but which when you calculate it out in terms of interest runs into large amounts.

Mr. SOUTHAM: This is an alarming situation. I am wondering if the practice is prevalent.

Mr. THIESSON: I do not know how extensive it is. He told me of instances he knew of it happening.

Mr. CLANCY: On this deal, or kick-back of interest, of course, you realize that if the deal goes sour the dealer has to take back the machinery.

Mr. THIESSON: Yes.

Mr. CLANCY: I cannot see a dealer taking a kick-back on rather dubious accounts. We were speaking about the farm improvement loan. The farm credit act provides for the financing of equipment at five per cent. I know of many areas in which several farmers, particularly young farmers, consolidate their machinery debts under this farm credit at interest of between eight and five per cent. This is a source of credit open to farmers. But, mark you, the advisers employed by the department make a check on them. However, they certainly are lending the money out.

Mr. THIESSON: You are speaking of consolidation of debt?

Mr. CLANCY: Yes.

Mr. USICK: This is not under the farm improvement loans.

Mr. ARGUE: My next questions have to do with the C.C.I.L. and perhaps something you might consider with the committee, as to where we go from here. Just to make a quick statement on your brief, I would say that it is an excellent brief diagnosing the disease without a comprehensive recommendation of a cure. There have been some important recommendations; one is freezing of prices of implements while the committee is working. In your brief you have stated that the C.C.I.L. is in the cooperative business handling implements to some extent and the cooperative federee in Quebec to a certain extent and with some real success. I put this proposition to you. One of the things necessary to be done if we hope to handle all the problems you have talked about—administered prices, planned obsolescence used by the companies as means of keeping prices up, excessive profits and mark-ups on repairs—is to get the ownership of a farm implement company in the hands of, preferably, the consumers or the farmers. Have you thought of the suggestion that the C.C.I.L. or the cooperatives in Canada generally should expand to the point where they could buy up an integrated farm implement business like Cockshutt and get into the manufacturing end of the industry where, I suggest, the real profit is made. Is there anything this committee can do by way of recommending an inquiry in order to see what might be done to finance the purchase and initial operation of such a large undertaking? I do know, from some information I had years ago, that the C.C.I.L. had seriously considered the purchase of the Cockshutt Company, but as time went by the company expanded and it became practically impossible with the finances they had. To me it seems that we have to get into the manufacturing industry in some way. Have you any comment on that?

Mr. HORNER (*Acadia*): That would be a better question to put to the C.C.I.L. when they are here.

Mr. ARGUE: We have a witness who is an authority in the farm field. I think this is an obvious question, whether the cooperative industry in any way can be expanded to the point where it can have control of the manufacturing and distribution of farm implements. If the witness does not want to answer, that is his business.

Mr. THIESSON: On the particular aspect of the C.C.I.L. entering into the manufacturing field, I think we have discussed with them the possibility of purchasing Cockshutt and the conclusion was it would require several millions of dollars to do that. I believe it would require a fair sized loan in order to do that. I do not know whether or not you are possibly referring to a government loan in an amount to make this possible. I am not certain what the attitude of the people in the C.C.I.L. is on this. I do not think they have adopted a policy of working in this direction. Therefore, I could not assume to try to make policy for them on it. I think this is something

which, as a producer organization, they will have to arrive at a decision on themselves.

Mr. ARGUE: As I see it the position of the farmers union is that while you have no control over the operations of the C.C.I.L., you have a general interest in agricultural conditions. Therefore, I think it is fair to ask you whether or not the expansion of a cooperative in this field might be the answer. Surely you have a point of view on the question.

The CHAIRMAN: Is there anything further on interest?

Mr. ARGUE: Mr. Chairman, I would like to ask the witness if he has anything further to comment on that point.

The CHAIRMAN: We will come to it on another clause.

Mr. BOULANGER (*Interpretation*): On a point of order, Mr. Chairman. Since this morning we have been dealing entirely with interest rates. Mr. Horner, as well as a number of other members, have dealt with them. I feel that we are not here to deal only with interest rates, but that our main concern is to deal with the prices of agricultural machinery.

The ACTING CHAIRMAN (*Mr. Forbes*): We are coming to that, Mr. Boulanger. However, the subject of interest was brought up, and after we dispose of that, we will be able to discuss the manufacturing end of it.

Mr. BOULANGER (*Interpretation*): Mr. Argue asked the witness to express his opinion on a matter of general policy. To me, this is politics, and this is not the place to carry on in such a fashion. If we are allowed to do so, there is no reason why we should ever stop.

The ACTING CHAIRMAN (*Mr. Forbes*): No; I think Mr. Argue's comment was relevant to the subject of machinery costs and interest.

Mr. ARGUE: Mr. Chairman, before we leave this—

The ACTING CHAIRMAN (*Mr. Forbes*): Just a minute, now. We have a list here. We have finished interest and we have a place on this list where you can make a general statement. This was left open by Mr. McBain.

Mr. ARGUE: Mr. Chairman, I asked at the opening of this meeting if I could pose two questions in that general field—one in respect of interest rates and one in connection with the C.C.I.L. operation. I took it that you gave me the right to do so. I asked about the C.C.I.L., and I would like to know from the witness whether he is going to comment further on the suggestion that this might be a field wherein at least part of the answer to high machinery prices could be provided. I think this is of exceedingly great importance to this committee. The committee will be making recommendations, and I think that they might look at the co-operative field as an alternative method of solving the problem. I also feel that the point of view of the national farmers union is pertinent, even though it is not a co-operative producing implements.

The ACTING CHAIRMAN (*Mr. Forbes*): You asked about that, and he is answering it.

Mr. THIESSON: I could answer it this way. If and when the C.C.I.L. have a policy that indicates that they are interested in buying out a farm implement company, whether it is Cockshutt or some other company, I am quite certain that the members of our organization would support them in this direction. However, as far as I know, up to the present time they do not have such a policy. I do agree that co-operative sales of farm implements can represent an important area of saving to farm people. I might say that part of the difficulty in this rests with individual people and also because of the general approach that is taken.

Mr. ARGUE: How would you reduce the price of farm implements? That is what the committee is all about. How would you reduce the price of farm implements?

Mr. THIESSON: Through the C.C.I.L.?

Mr. ARGUE: Through anything. You have said, "We will freeze them while the committee inquires." Have you a single proposal which would reduce the price of farm implements?

Mr. THIESSON: First of all, you would have to assess the underlying cause of higher prices on farm implements.

Mr. CLANCY: I object to this kind of questioning. That is the purpose for which we are here.

Mr. ARGUE: I was just asking what their recommendation was to reduce prices.

Mr. CLANCY: Let's get on with our work.

Mr. MUIR (*Lisgar*): Mr. Chairman, I believe I am next on the list.

The ACTING CHAIRMAN (*Mr. Forbes*): Yes. Are you finished with your reply, Mr. Thiesson?

Mr. THIESSON: Allow Mr. Muir to go ahead.

Mr. MUIR (*Lisgar*): Mr. Chairman, I would like to get away from the preamble and to get down to the reason why we are here. I am referring to the cost of farm implements to the farmer.

I note, in the recommendations to the committee in your brief, that you suggest that farm machinery be made smaller to suit the needs of the average farmer. I have four questions to pose in this regard.

Is it not true that the farmers are requiring larger machines for two reasons: first, to reduce the per acre cost of operation and, secondly,—particularly in the case of tractors—the farmer's experience has been that surplus power for any farm job does a better job of it and lengthens the life of the tractor. You have proposed that we recommend that farm implement companies build smaller machines. If you like, I could go further. Actually, small farm tractors are needed for specific purposes, and they are being produced by the machine companies for those specific purposes. However, to suggest that the farm implement companies produce smaller units in larger volumes for a market which is not going to absorb them, is, from my point of view, unrealistic. I say that for this reason: Unless you have a market for the product that is produced, then of course no private enterprise company can afford to produce them.

Mr. THIESSON: What we are trying to do, in what has been referred to as the preamble, is to outline some of the different factors that are involved in agricultural production. It has been noted by the authorities that we have quoted that the trend is toward the manufacture of larger sizes in farm implements. Now, perhaps it is not always necessary that a larger farm implement can serve the best possible purpose for the farmer. For example, if a farmer buys a farm implement that has a working capacity larger than what is really economical for his farm, it means that he is pressurized into the need for more land in order to use his farm machinery to the greatest possible efficiency. In order to use a machine efficiently, he must be able to keep his unit cost of production—his bushel of grain or whatever it is—down to the lowest possible cost. If he has a machine that is suited to working one and one-half sections and if he only has a section or three-quarters of a section, the cost of depreciation of that machine will be greater. It is set at a certain rate per year. If this depreciation has not been used in his production, it means that his unit cost of production goes up, because the depreciation is greater than really is necessary. Then, although the machine might still be in good running order in five or ten years, he has it depreciated out, in so far as book value is concerned. Then, he runs into another problem, that of obtaining parts. If he cannot obtain parts, the machine is obsolete and, as a result, what he is not

able to efficiently use in depreciation in his production cost he loses through obsolescence. For this reason, if he is required to buy a machine which is larger than is needed for his particular farming operation, then he is caught up in a cost-price squeeze in this area.

Mr. MUIR (*Lisgar*): Of course you realize, Mr. Thiesson, the farmer now has his choice of the size of tractor he wants and the manufacturers are still building small tractors. The point I am trying to bring out is that the farmer with a small farm will not buy a small tractor because he wants to reduce his acreage costs, and that includes the depreciation about which you speak. Secondly, a machine with surplus power will outlive one that is worked under full load all the time. The farmer himself has made his choice and I do not know that the committee can recommend the farmer to buy a smaller tractor, just because he should have a smaller tractor, when he himself decides he is doing better with a larger one.

Mr. THIESSON: Actually, of course, he may not be doing better on balance with a larger one. When you say he is making the choice by himself there are other factors to be considered, such as advertising, promotion and that type of thing. All this possibly suggests to him that he needs a larger tractor than he actually does.

Mr. ARGUE: I was about to interrupt. Is not part of the trouble here that the companies cease making spare parts for the smaller tractors, even though the tractors are in good shape and could be kept running?

Mr. MCINTOSH: Are we not running off the lines?

Mr. MUIR (*Lisgar*): I am still questioning.

Mr. MCINTOSH: That is what I am getting at. Are we all going to be allowed to make interjections like this?

The ACTING CHAIRMAN (*Mr. Forbes*): I was hoping you would all be adult enough not to interject when another fellow is speaking.

Mr. ARGUE: A very straightforward statement.

Mr. MUIR (*Lisgar*): The point I was trying to bring out is that you have to give the farmer some credit for being able to operate his own holding. It is he who has decided he wants a larger tractor, and I do not think it is up to the committee to suggest to him that he should buy a smaller one when he has already decided he should buy a larger one. Actually, even in the case of a small combine, when a farmer starts out on a half section with a small combine he may get a day's work done, then the weather closes down on him and he is through combining for six weeks. On the other hand, if he has a larger combine he could have his work finished and, in that particular instance, could pay the difference between the smaller and the larger combine over a period of time. Mr. Thiesson, I do not think that particular section of your brief holds too good.

Mr. THIESSON: I think it is a trend.

Mr. MUIR (*Lisgar*): You think it is a trend?

Mr. THIESSON: Yes.

Mr. MUIR (*Lisgar*): At that point of disagreement I shall leave the matter and go on to another question. Do you have any specific examples of high valuations being placed on used machinery for duty purposes at the border? Have you any specific examples which you could give of that?

Mr. USICK: I think the answer is simply that the amount of second-hand machinery now moving over the border has dwindled considerably as compared to what it was before, and the reason for that is because of the high valuations placed on it.

Mr. HORNER (*Acadia*): I have a supplementary question to that.

Mr. MUIR (*Lisgar*): That is exactly opposite to the answer I got from a customs man while I was home a year ago, just before the Miami meeting. I was questioned about this matter so I phoned him and asked him about the importation of second-hand machinery. He told me that second-hand machinery was coming over at true Canadian valuations; that is, if there was evidence the price paid in the United States was not too far below what a farmer would be expected to pay in Canada, there would be no duty whatsoever. I make this statement with full assurance, because this was one of the men who places the duty on machinery when it comes over the border. I had his full assurance that, unless there was some skulduggery in the price across the border, a machine would come over without duty. Unless you wish to comment on that, sir, I have one further question—

Mr. USICK: That information sounds odd because I am familiar with your constituency in Manitoba. I know there were a great many complaints from your area, particularly from the farmers there. We got those complaints in our office stating they could not bring in second-hand machinery from the United States. They used to bring in a great deal of machinery at one time until the change in the regulations and, after that, they had to pay a valuation on the second-hand machinery after they brought it into Canada. They questioned this procedure and most of the complaints came from that area. Therefore, that information, if it is correct, certainly seems at variance with ours.

Mr. MUIR (*Lisgar*): My information from that chap was that the regulations had been changed the other way, and the reason these people did not import second-hand machinery was because they did not inquire what the situation was. Up until the regulations were changed the farmers had cause for complaint and, about six months before this meeting, a lot of them had quit trying to import second-hand machinery but, had they inquired at the border, they would have found out the regulations had been changed the other way around, not up but down.

Mr. THIESSON: I should like to comment on that.

Mr. MUIR (*Lisgar*): That is the answer I got.

Mr. THIESSON: I read the evidence given by Mr. Magill before this committee, I think it was in July last, and he mentioned that it was done under a section of the tariff act which referred to a class or kind made in Canada. I think this is a general provision.

THE ACTING CHAIRMAN (*Mr. Forbes*): That is something new.

Mr. THIESSON: Does this definition apply to imported second-hand machinery?

THE ACTING CHAIRMAN (*Mr. Forbes*): It could.

Mr. THIESSON: May I comment on it in this way? I understand there is the farm implement industry in Canada and also the farm implement industry in the United States. From the evidence that was given, this industry is organized in such a way that part of certain lines of farm equipment is manufactured here and sold in Canada and America, and vice versa; and I was just wondering how it would be possible to apply a tariff on a second-hand machine if it was of a class or kind made in Canada. For example, certain lines of farm equipment which are manufactured in both Canada and the United States obviously could not have that apply to them, for instance, with one part being made in Canada and the other part being made in the States.

Mr. MUIR (*Lisgar*): I do not believe class or kind comes into it.

Mr. CLANCY: It does not affect this at all.

Mr. MUIR (*Lisgar*): It is other manufactured goods.

Mr. ARGUE: This is a dumping duty.

Mr. HORNER (*Acadia*): For farm machinery this is a dumping duty.

Mr. ARGUE: And it is not a tariff. It is the difference between the purchase price and the valuation put on by the official customs. It is no wonder the farmers stopped importing second-hand machinery.

Mr. MUIR (*Lisgar*): This customs man told me that if a fair price, a reasonable price, had been paid for the machinery in the States there would be no dumping duty applied.

Mr. ARGUE: Yes, but if the farmer had bought a cultivator for \$300 in the States, and if the customs officer said it was worth \$1,000, he would have the other \$700 to pay.

Mr. HORNER (*Acadia*): You have not bought any cultivators lately if you think you can buy them for that.

Mr. ARGUE: Second hand.

Mr. HORNER (*Acadia*): What size?

Mr. ARGUE: In this case it is what the customs officer decides.

THE ACTING CHAIRMAN (*Mr. Forbes*): Mr. Boulanger wants to catch a train, and wishes to make a statement before he goes.

Mr. MUIR (*Lisgar*): May I ask one more question?

Mr. BOULANGER: Go ahead.

Mr. SLOGAN: I have a comment to make on this tariff business.

THE ACTING CHAIRMAN (*Mr. Forbes*): We will let George go on.

Mr. MUIR (*Lisgar*): This is going to take a little time.

THE ACTING CHAIRMAN (*Mr. Forbes*): Then, all right; let Mr. Boulanger go ahead.

Mr. BOULANGER (*Interpretation*): I just want to put one question to the president of the national farmers union.

THE ACTING CHAIRMAN (*Mr. Forbes*): What page are you on?

Mr. BOULANGER (*Interpretation*): Page 24. I want to put one question. The recommendations you have made are largely similar to the one made in 1937. In paragraphs (c) and (d) you state that the price of agricultural machinery is excessive. I would ask you to tell me, if you can, on what basis these recommendations were made. Can any figures be provided in respect to the price of agricultural machinery and in respect to the special types of machinery?

Mr. THIESSON: First I would like to comment that in the opening part of paragraph 75 we are suggesting that we believe this committee will find many of the things that were found in 1937 and that are still found to be true today. With respect to the prices of farm machinery, the general price of these has increased or doubled in the last 20 years, that is the price to the farmer has doubled in the last 20 years. With respect to a specific farm implement, I would ask Mr. Usick and Mr. Tebbutt to comment on that. I think probably they can give us some examples of prices on combines and tractors that have rapidly increased.

Mr. USICK: Mr. Chairman, as I understood the question, it was dealing with special points in section 75, and section 75 is taken right out of the recommendations of 1937. If you say many of them still hold true, that is the answer to the specific question asked by Mr. Boulanger. If you want prices of farm machinery, these can be obtained. We have not got them right here. You can obtain them from the implement companies also.

Mr. BOULANGER (*Interpretation*): Up to this time we have been dealing mainly with the price of machinery of interest to the west. In the east we do not know about these things, and what we are really interested in is the actual price of machinery.

Mr. MUIR (*Lisgar*): Is it this book?

Mr. BOULANGER (*Interpretation*): Up to this time we have been dealing with combines and similar machinery for large-scale farming. In our end of the world we do not have large farms and I am particularly interested in the price of small machinery.

The ACTING CHAIRMAN (*Mr. Forbes*): That can be obtained from the machine agent.

Mr. MUIR (*Lisgar*): It is all right in here, small and large.

The ACTING CHAIRMAN (*Mr. Forbes*): Do you want to know the present price compared with ten years ago, or something like that?

Mr. BOULANGER (*Interpretation*): There is another point too. The prices of some types of machinery must have increased more than the prices of some others. That should be of interest also.

Mr. HORNER (*Acadia*): We have had evidence to that extent already.

Mr. MUIR (*Lisgar*): Is the farm union prepared to submit any specific proposals as to how farm machinery costs to the farmer can be reduced—first, to the manufacturer; second, in distribution and third, in upkeep or repair.

Mr. THIESSON: It would be necessary to consider this, in order to make intelligent proposals on the question that you have asked. This is not a simple question that you have asked me.

Mr. MUIR (*Lisgar*): This is what the committee needs from our farm people.

Mr. THIESSON: We have not got all the facts with respect to profit margins of farm machinery companies. For example, with respect to the costs of capital input in their plants, and with respect to labour costs, and this type of thing, we have not all the facts. We do not know to what extent, for example, administered prices play a part in the field of farm machinery. We are asking that the committee look into these things.

Perhaps after you have found these facts,—and we cannot just tell you here that you should apply the anti-combines law, because it has to be proven first, whether there is evidence of a combine existing. Perhaps at the level of price controls, there would be a logical conclusion, but we do not know. We do not know yet what the answers to all these questions are. I think that possibly to do that would be making a suggestion which might not have any foundation for being suggested.

What we are suggesting here is that the committee carefully look into the field of administrated prices. The United States Senate subcommittee has investigated the automobile industry. They found that administered prices do exist. This is in a minority report of that committee where it is suggested that the same holds true in respect to farm implements. The report is made by just one commissioner, by one senator.

But as the person who defined the term “administered prices” it is coming to be accepted. They are known in our modern society; but he admits himself that they do not know just what the full impact of administered prices is in terms of unemployment, and in terms of the balance of the economy. This is something we do not know either.

But after you have heard from the farm implement companies, I hope that you will get from them a picture of their pricing policies. Then it might be possible to come to some type of conclusion in this respect.

Dr. Means, the man I quoted as having defined the term “administered prices”, said that we do not know enough about how they actually operate to be able to make good national policy in the economic field, the inflation field, the employment field, and the enforcement of competition. We do not know what the factors are. We do not believe there is any real competition

between farm implement companies; though they compete in respect to sales they do not compete in respect to prices, and there is distinctly a difference between the two.

If there is no competition in price, then of course this means that the farmer does not have any real break in terms of the effect of administered prices in the farm machinery field.

The farm implement companies can pass down the price to the producer. On the other hand, the prices of farm products are determined according to the market price, and that is where you have a fluctuating level in prices.

The farmer has a competing price at one end, and a fluctuating price at the other end, and he reaps the disadvantages of both.

Mr. USICK: I would like to comment further upon Mr. Muir's question. I think we have passed recommendations that you could go on in this committee, to cover many things, and we make those suggestions with respect to farm machinery costs and services at pages 11, 12, and 13 of our brief. More particularly, one of them has to do with standardization of parts. For such things as V-belts, sprockets and shafts, bearings, tires, rims, and so on; and where there is no standardization between the companies, where the availability of parts is not readily made to the farmer, if it could be made more than a recommendation and made effective so that there was some real standardization of farm implements, this would be a real help at the production end of farm machinery.

Mr. HORNER (*Acadia*): One of the reasons for calling the farmers union before us first was so that we might be in a better position to ask the real reason for these increases. I think my question was supplementary to a question asked by another member in respect of farm implements coming in from across the border. We are aware that the prices have gone up 52½ per cent in the last twenty years and 50 per cent in the last ten years. What percentage of this increase do you attribute to the tariffs which might be imposed upon second-hand machinery coming in from across the border. In a sense this is the way I see it: we have to find out what has caused this 50 per cent increase.

Mr. THIESSON: I think those figures are on new machinery sales. I do not think second-hand machinery sales are involved in that.

Mr. HORNER (*Acadia*): What percentage of the cost of farm machinery would you attribute to this second-hand machinery coming in from across the border?

Mr. THIESSON: I do not know what volume comes across, and I do not know where the information is available.

Mr. HORNER (*Acadia*): In other words, it may play a large part or a relatively small part.

Mr. THIESSON: Frankly, I think it is relatively small in the total. However, there are other aspects of it. If this is based on the question of a dumping duty, my interpretation of a dumping duty today is that it is a duty applied when a commodity from another country is brought in at a price lower than that at which it would sell in that country. I do not know whether or not this is true in the case of farm machinery.

Mr. SOUTHAM: I questioned Dr. Magill of the Department of National Revenue on that, and I think you are right. I think the thought was that we have to protect our machine dealers in Canada. If by some chance a farmer had access to an agent with a surplus of second hand machinery he would probably get a better price. I do not have any evidence of this, but I have been told that a farmer can go across, pay a reasonable price for a piece of machinery, and have that agent give him an invoice marked away down. In

order to combat that type of practice we have to look into it to try to obtain a relatively comparative price of second hand machinery on one side of the border and the other side.

Mr. PASCOE: My questions have pretty well been asked. However, on page 23, Mr. Thiesson refers to isolated instances of high rates of duty on importations. Does that mean you think it is a very small problem.

Mr. THIESSON: In our province there have been some in Mr. Southam's area. They are only isolated in our experience. Mr. Usick says they have had more experience of this than we have.

Mr. PASCOE: If it were widespread and they could bring in new and used machinery duty free, what effect do you think that would have on the trade in respect of the value of the equipment the farmers in Canada have?

The CHAIRMAN: Mr. Gundlock—

Mr. PASCOE: The question was not answered.

Mr. THIESSON: I was thinking about it. It is hard to assess the effect it would have. Basically the effect at present is that a farmer is penalized in trying to keep his costs down because of this tariff provision. At the present time it is adding to the cost to any farmer who wants to bring farm machinery across. If there is not a duty on new machinery, it certainly would not seem reasonable there should be on second hand machinery.

What I mean is that it just is not consistent.

Mr. GUNDLOCK: Mr. Chairman, I am a little bit surprised that what I have to say has not come up before. I would like to have the union's ideas and comments, particularly in relation to price competition in connection with the amount of foreign machinery coming into this country. I am interested particularly in European machinery, because I think they are the main competitors to our Canadian and United States manufacturers. I would like to hear your comments in connection with the foreign imports, as it relates particularly to price competition. Also, you might comment on the matter of service and parts.

Mr. THIESSON: Mr. Chairman, one of the prime problems of importing foreign machinery has been always in the parts end of it. Actually, on total volume, the imports from countries other than the United States are not too large.

Mr. GUNDLOCK: I would like to hear your comments related to price competition. For instance, I understand that an English Ford tractor is noticeably cheaper. I would like to hear your comments in this connection as well as it relates to parts and service. As far as I have been able to find out, service and parts are just as readily available for European tractors as for Canadian ones.

Mr. USICK: That is not common, though. The European tractors and machinery do not have as many parts as the machines that are made in Canada and the United States. It may be true in some areas, but it certainly is not the general rule.

Another point is this: There is a great deal of this machinery which has to be adapted to the conditions within Canada, and the type of farming which takes place in Canada. Their machinery is adapted for a different type of agriculture. They might be cheaper, outside of the tractor—and even some of the tractors have to be changed in model or design, or gear ratio for adaptability here in Canada. This is one of their main weaknesses in selling implements here.

Mr. HORNER (*Acadia*): That is not the case in connection with their strawbaler behind a combine.

Mr. USICK: I am not trying to be specific.

Mr. GUNDLOCK: What I am trying to bring out is this: We heard this morning that some of the particular parts and service are not Canadian. It has been my experience that some of the European people service machines and supply parts even better than some of our Canadians.

Mr. TEBBUTT: Mr. Chairman, if I might comment on this question, as I come from the province of Ontario where we have perhaps a greater importation of foreign tractors from European countries and England, I do not think it is a matter in regard to parts and service, regardless of where the machine is manufactured.

The difficulty that we have run into our province, or various parts of it, is that the machinery dealer is perhaps forced out of business for one reason or another and the company that he represents has not got sufficient service to cover that area. That is where the supply of parts in the area comes in. Perhaps this is only in a short interval and in isolated areas, but it is one that is prevalent and it is one that must be considered. I do not think it applies any more to English tractors or European tractors than it does to Canadian or United States machines, but it is one thing that availability of parts does to some of the dealers that are forced out. For example, you have, in the county that I come from which has approximately 6,000 farmers, only one Massey dealer and one John Deere dealer. In the interval when this change was taking place, from the dealer in every hamlet to a dealer in a county there was certainly a shortage of service and a shortage in the availability of parts. Perhaps this is something that gets corrected as time goes on but it is worth mentioning.

Mr. GUNDLOCK: Is there a real price competition, even with the European lower-priced models?

Mr. TEBBUTT: I have never heard complaints with European tractors or with United States tractors.

Mr. FANE: Mr. Chairman, Mr. Thiesson made a remark a few minutes ago that there was no competition in the matter of prices between farm implement companies, but there was competition in their sales. Does he mean that the farm implement companies all get together and set the price of their machines as though it were a combine? Are all implement companies in effect acting as a combine, as you could infer, or did you mean something else?

Mr. THIESSON: I did not say it was a combine.

Mr. FANE: You did not say it; I am merely asking.

Mr. THIESSON: What I said was there did not appear to be any evidence that the main area of farm implement sales were made in terms of price. I think they compete for sales, but I do not see where they compete for price. They do not go around cutting one another's throats if they have a surplus of tractors, to try and get rid of them. I do not know whether this necessarily implies a price-fixing combine. This is perhaps the conclusion that the committee might come to after it has had farm implement companies before it. It has happened before, and I think we just recently had a case where there was evidence of combines between General Electric and Westinghouse, and these large electrical companies. It is not unusual, and I think we have had several combines in Canada within recent years. It is possible that it is also prevalent in farm machinery.

Mr. MUIR (*Lisgar*): Do you not think there is keen competition among the dealers of farm implements?

Mr. THIESSON: At the dealer level, yes; at the factory level, no.

Mr. HORNER (*Acadia*): Supplementary to that, in a sense, Mr. Thiesson, we had evidence before the committee that there is a great price competition at the dealer level. In a sense that would counteract your statement in the

brief which says that there is no effective competition in price matters. I would suggest—I do not want to defend the machinery companies, that is the last thing I want to do—but that happens even at the machine company level. I bought a tractor last June at such and such a price from such and such a company. I paid the price to the dealer and yet I got a refund of \$150 direct from the company head office for purchasing that tractor before the end of June. In a sense I would say this constitutes a certain type of price competition on the machine company level.

Mr. THIESSON: I would say that this is a competition for sales, but not a competition in price.

Mr. HORNER (*Acadia*): I welcome it.

Mr. THIESSON: Because in the unit cost of the farm implement this type of refund may have been provided.

Mr. HORNER (*Acadia*): If this was provided for, why then after a certain date in June was this no longer applicable?

Mr. THIESSON: It is possible that if you bought that machine in the fall, for example, or placed your order in the fall, it could be that the company brought this type of incentive forward in order that it could plan its plant production.

Mr. HORNER (*Acadia*): You still maintain it is not a price competition?

Mr. SLOGAN: Mr. Chairman, I have a supplementary point on farm machinery. We got away from it. All these complaints were being heard from the farmers when an anti-dumping duty was put in. As Mr. Argue stated, when the customs officials at the border evaluated the machinery the farmer knew he would have to pay the difference between what you have to pay and what they estimate the cost of machinery was. This dumping duty was never supposed to be aimed at the farmer but at the agents who were going across and bringing machinery over and reselling it at a profit in Canada. In my area, where we are going into potato growing a great deal and have to go down to pick up machinery, we can do that in North Dakota and Minnesota very cheaply. We had an instance on our farm where we had to do the same thing. However, I complained about that and so did other members; and at the present time where farmers go to the United States and buy machinery, they bring it to the border and declare the value of that machinery. It is usually supported by receipts from the dealer, and that machinery has to be left over at the declared price. There is no duty paid. That price is sent into Ottawa and they evaluate it here, and if they feel it is ridiculously low they can still assess the farmer. Since that has been brought in, those complaints have no longer been heard because this duty was aimed primarily at the agents and not at the farmer. I think that when they review it here they generally give the farmer credit.

Mr. MUIR (*Lisgar*): I would like to make a comment on that last suggestion. Since Mr. Usick brought this up when I was speaking of this very thing in regard to bringing new machinery across the line, can he proceed?

Mr. GUNDLOCK: Mr. Chairman, this is not a new business but I think Mr. Tebbutt has one more comment. Would it be in order to hear him?

Mr. TEBBUTT: With regard to foreign machinery companies, this was your price competition question?

Mr. GUNDLOCK: I thought you had something else to say when we stopped.

Mr. TEBBUTT: It is immaterial whether it would be in the records or not, but for the information of the committee members I would say that in our area in Ontario and various areas in the province the only real competition that I can see piecewise is between European and American tractors.

Mr. GUNDLOCK: Not between European and Canadian?

Mr. TEBBUTT: I doubt it. There are very few tractors manufactured in Canada.

Mr. THIESSON: If I might comment on the import question, I think the extent to which imports are successful would be reflected in the volume of imports brought in, and for one reason or another if a farmer is not buying it does not really matter. Obviously there is some reason why they are not favouring it, but I received yesterday morning from the dominion bureau of statistics the imports into Canada of tractors for 1960. There were 29,011 imports, and of these 21,851 were imported from the United States. The largest other foreign importer was the United Kingdom with 6,426, with smaller quantities from France, Germany, Italy, Sweden and Japan. In other lines of farm machinery it is much less than that.

Mr. MUIR (*Lisgar*): I would like to comment on what Mr. Slogan said in regard to importation of used machinery. I had made the statement that a year ago I had contacted the man at the border and he gave me exactly the same information as Mr. Slogan has given. The reason I bring it up is because Mr. Usick made a comment that he did not think this statement was correct and that it particularly applied to my area, where you had more complaints than from other areas of the province. I do know that this statement I made was correct, that the machinery was allowed to be brought in at the price the farmer paid for it across the line.

As Mr. Slogan said, it was sent to Ottawa; if it was found to be reasonable there was no duty paid on it, but if there was found to be skullduggery—which is a word I have used before—in the transaction, and that it had been lowered for duty purposes for bringing it across the line, then, of course, an adjustment was made in Ottawa.

I think Mr. Slogan has substantially backed me up in regard to this.

Mr. KORCHINSKI: In regard to what Mr. Jack Horner has been saying, and in all fairness so that people may not go away with the wrong impression, may I say I understand that for example, a Cockshutt dealer back home last year, after the combines season was over, was offering special deals in this equipment. I have also seen special deals in tractors at certain times. I have seen drills offered after the normal sowing season. I do not know whether you could get the information, Mr. Thiesson, but this is actually happening back home, so I would just like to keep the record straight on that.

Mr. THIESSON: I am not sure that you are referring to competition in price.

Mr. KORCHINSKI: That was handed down from the company to the dealer.

Mr. THIESSON: I think it is competition in sales. I believe that if you examine this facet closely you will find that this is in fact competition in sales and not in price.

Mr. KORCHINSKI: How can you distinguish one from the other, if it comes from the factory?

Mr. THIESSON: I will not comment any further, as there are authorities in the back of this room who know more than I do.

Mr. KORCHINSKI: This point was brought up at the time. It is just a comment.

Mr. HORNER (*Acadia*): Is it not a fact that last year the Cockshutt Farm Implement Company came out with the idea direct from head office that they would sell you a machine, and you would not have to pay for it at the time. You could take possession of it immediately, and not pay for it until six or

seven months hence. In other words you are getting the use of that money interest free for six months. This competition led to competition with the other companies; it induced other companies to do the same thing. Is this not a fact, or are you aware of it?

Mr. THIESSON: Yes, I am aware of it. I think it is a mirage.

The ACTING CHAIRMAN (*Mr. Forbes*): Are there any further questions?

Mr. SLOGAN: We have been talking a lot about what everybody else could do. I wonder if Mr. Thiesson could tell us what he believes his own organization could do, with their membership, in the matter of interest and prices on farm machinery. There is definitely a role to play, and I am sure that the farm unions could play it. I wonder if the farm unions are prepared to do so?

Mr. THIESSON: It would be in the field of education, and we are working in this direction. For example, this winter we have taken a pretty close look at the set-up in the co-operative federee in Quebec, to which we make reference in our brief. We find that some of the methods employed by them are possibly more effective than is the case with the C.C.I.L. in the three prairie provinces. It is a matter requiring some re-organization within the industry, that is, within the C.C.I.L. We cannot order them to do it, but we can form a type of public opinion on it that might cause them to move in that direction.

Mr. SLOGAN: Have you tried in any way through your organization to work on behalf of the C.C.I.L. with a view to promoting it among the farmers?

Mr. THIESSON: Yes, we have.

Mr. SLOGAN: Do you feel you have done as much as you could do in that respect?

Mr. THIESSON: No, I would not say that we have.

Mr. HORNER (*Acadia*): Would you care to compare the Quebec federee or co-operative with the C.C.I.L.? You use two per cent for the C.C.I.L. and 20 per cent for the province of Quebec. Have you any idea what this 20 per cent means across Canada in total sales?

Mr. THIESSON: I was using those two instances because the C.C.I.L. operates only in the three prairie provinces.

Mr. HORNER (*Acadia*): I see; I did not know it.

Mr. THIESSON: While the federee operates only in the province of Quebec.

Mr. HORNER (*Acadia*): Was this two per cent only on sales in the three prairie provinces?

Mr. THIESSON: That is correct.

Mr. CLERMONT: And the 20 per cent comes out of the sales in the province of Quebec?

Mr. THIESSON: There is a basic difference there which probably makes a large difference between the two. You have Cockshutt dealers in the three prairie provinces, and you have the C.C.I.L. selling the same products. Quebec has organized its implement agencies very wisely, in that there are exclusive distributors for all Quebec, and they do not compete against other agents.

Mr. HORNER (*Acadia*): The co-op in the province of Quebec sells, or is paralleled along the lines of suggested list prices, and then it gives a rebate to the purchaser.

Mr. THIESSON: That is right.

Mr. HORNER (*Acadia*): Does the Quebec co-operative sell all their equipment under the same line, or do they enter into something else?

Mr. THIESSON: The Quebec federation has agencies set up through the local co-operative associations. The co-operative federee, I should explain, is a producer organization. It is not comparable to the federated co-operatives

in the prairie provinces, which are consumer organizations. But it sets up its dealership through the local co-operative associations. In some instances where it has no co-operative outlets, or where the co-operative outlet does not wish to take on farm machinery sales, they have set up private people to sell co-operative farm machinery.

Mr. HORNER (*Acadia*): Could you tell us how their sales actually are administered, whether or not they give a rebate to the purchaser, or give a cut price to start with, and work on a lower margin?

Mr. THIESSON: I had a report on it, but I am speaking from memory now. I believe they allow the local association 25 per cent on the list price of the machinery. There are certain discounts for purchases during certain periods of the year which they allow.

Mr. HORNER (*Acadia*): And they would pay a dividend?

Mr. THIESSON: They would pay a dividend to the local association; it is a small one. The local association, in turn, may pay a dividend to the customer.

Mr. WEBB: I do not believe I have any questions, but I quite agree it is not the dealer who is making the money which is causing our troubles.

Mr. THIESSON: There is a unique thing about the cooperative federee in Quebec. They have placed emphasis, in their farm distribution system, on providing a service to the farmer. I understand there is no farm implement act in the province which demands that a company maintain repair stocks for a number of years. They, however, are trying to provide this service to their customers. I think they have gone a long way in doing this.

Mr. SLOGAN: I would like to express the same criticism of this brief which has been expressed by Mr. Argue and others; that is, you have not really given us something to work with in here, other than the problem. May I make the suggestion that in future when you are preparing briefs that you give us some comprehensive leads as to what you think the government and you yourselves could do. You are an important segment of the economy and I think you should be prepared to play your part, as well as expecting everybody else to play theirs.

Mr. RAPP: Mr. Chairman, I cannot agree with Mr. Slogan. I think the brief has gone into this matter in great detail. Some of the recommendations are very good indeed. Of course, sometimes they had to make their statements in general terms, but generally speaking I think the recommendations they have brought before this committee are commendable. I am sorry I must disagree with you, Mr. Slogan.

Mr. KORCHINSKI: I am wondering what your organization would say if a trend developed where machine companies had machine rentals available.

Mr. THIESSON: That is mentioned in the brief. I do not believe you were here this morning when it was mentioned. A bulletin reached my desk before I left about rental rates in the United States. This may be of interest to you. This is in the April issue of the *IFAP News*. It says:

Farmers are renting everything from small tools to heavy tractors. Some U.S. economists suggest a farmer can afford to pay up to 20 per cent of the purchase price of new equipment every year in rentals and still be economically ahead. Here are some nationally suggested rental rates:

For one week, 5 per cent of the new purchase price.

For one month, 15 per cent.

For two months, 25 per cent.

For three months, 33½ per cent.

Mr. HORNER (*Acadia*): Wow! That is pretty steep.

Mr. THIESSON: I checked these rates and they were quoted by a man by the name of Paul M. Mulliken of the national retail farm equipment association.

Mr. KORCHINSKI: Is that on a rental purchase agreement or straight rental?

Mr. THIESSON: Straight rental.

Mr. PASCOE: This is a general comment on the whole brief. On page 1 there is the statement that the national farmers union welcomes this opportunity of presenting the views of the organized farm movement. Then it goes on to say: "Our members are vitally affected by all cost factors". There is very little in the brief in respect of what they consider the cost factors. At another meeting I referred to the questionnaires which I and other members sent out and in nearly every case the farmer, when asked about the important factors which he considered contributed to the prices of farm machinery, replied that it was the excessive profits to the manufacturers. Also, there is no indication in this brief as to what the farmers thought of your questionnaire.

Mr. THIESSON: Probably we did not ask this in the same way as you did.

We do say that farm machinery prices are too high. However, there are other factors in the economy which could lead a farmer to this conclusion; that is, if you have volume farm prices, for example, or unstable farm prices, and if machine prices stood at the same level while farm prices continued to go down, machinery prices would be too high, in terms of the purchasing power of farm production. With respect to labour costs we have not mentioned it for specific reasons. The Canadian labour congress is going to appear before this committee at a later date.

Mr. PASCOE: The point I am trying to get at is this: Did you ask specific questions? Also to how many farmers did you send out your questionnaire?

Mr. THIESSON: We sent it out to our locals. If you wish, I could read the questions that were asked. They are as follows: "What problems do you feel affect you most in the operation of farm machinery?" Then they gave, in order of incidence, that "the prices were too high". This could mean that the level of farm machinery prices were too high. Also, it could mean that the prices are too high in so far as the implement companies are concerned, or that farm prices are too low for them to buy machinery at the price levels requested. Another was "availability of parts" and "poor local service", as well as "poor construction". Then there were several other isolated examples of having to buy unit assemblies and this type of thing.

The second question reads: "Give any specific examples you have with respect to any of the above problems." They gave a number of examples. Some of them have been summarized. Some of them were valid and some were not.

The third question was: "What recommendations would you make with respect to farm machinery that would improve the position of the farmer?" These all have been incorporated in here, and they include such things as "standardization", "lower prices and tariffs", "sometimes repairs will not fit, although they have the same number", and so on. I could file this, if it is the wish of the committee that I do so.

The ACTING CHAIRMAN (*Mr. Forbes*): Is it the wish of the members of this committee to have this incorporated?

Some hon. MEMBERS: Agreed.

The ACTING CHAIRMAN (*Mr. Forbes*): Have you a question, Mr. Henderson?

Mr. HENDERSON: I have just a few words to say, Mr. Chairman, and it is in connection with trade-ins. Trade-ins are the curse of the machinery business. I come from the Peace River country. The farmers in that area are

very prosperous. The big outfits up there which handle farm machinery are the Case and the John Deere people. A farmer comes into town to buy a new tractor. He immediately starts to dicker, and there is competition in so far as the trade-ins is concerned. There was one farmer there with a small tractor on his land who said: "the dealer came out and dumped it here and said 'if you can use it, pay for it, and if you cannot, bring it back' ". That went all over the district. Then, my boy went down to the Panhandle in Texas and, after seeing things there, said that the best looking farm machinery he had seen was in the Peace River country. He never saw the likes of it through Missouri and all the way down. Keeping up with the Joneses is what is making things expensive.

Mr. THIESSON: I should like to comment further on Mr. Pascoe's statement about labour costs. As I have said, the Canadian labour congress will be appearing before this committee. Recently, they put out a pamphlet claiming that labour prices are not the main thing.

Mr. PASCOE: Do you agree with that?

Mr. THIESSON: Not entirely. I do not say they are the only thing, but I do think that possibly you will find labour costs have gone up over a period of years. It all depends on how you measure it. Just before coming to this committee I got a publication from the American assembly, Columbia university, on "wages, prices, profits and productivity". I have not yet had a chance to read it fully but, in its conclusions, it says this:

The advice is frequently given that wage increases should be based on gains in output per man-hour for the economy as a whole.

For example, the economic report of the president—

This would be the president of the United States

—of January, 1959 states, "increases in money wages and other compensation not justified by the productivity performance of the economy are inevitably inflationary."

The advice that wage increases should be based on gains in productivity for the whole economy, like much sage-sounding advice, is far easier to give than to take. The difficulties in applying it to any particular situation must be as apparent to those who have tried to follow it in wage determination as they are to those who have tried to construct accurate measures of productivity and wages. One trouble with the advice is that it concerns broad averages, and there may be sound reasons why any particular situation should deviate from the average in one direction or another. An important class of such reasons is shortages or surpluses of labour in particular industries or occupations.

The ACTING CHAIRMAN (*Mr. Forbes*): Mr. Webb is the next to speak.

Mr. WEBB: You were speaking about the questionnaire which you sent to the farmers. I was covering my area and I sent out a goodly number to which I received a sheaf of replies. I discussed this matter with one of the witnesses during the noon recess, and over 98 per cent of the farmers who replied put down as their first cause, the high cost of labour and the unions not knowing where to draw the line. This morning I was sitting beside Mr. Forgie, who represents Renfrew North, and he has received a greater number of replies than I did and his percentage was about the same. In the farmers' opinion it is due to labour costs and the unions.

Mr. THIESSON: It may have been a leading question that was asked.

Mr. WEBB: No, it was not. I shall show you a copy of the questionnaire.

Mr. FANE: I think we had hundreds of them all saying the same thing.

Mr. HORNER (*Acadia*): I want to ask one more question but I do not wish to prolong the meeting. On page 24 of your brief, conclusions and recommendations, (D), you suggest that the financial position of the companies has been absolutely too good to your line of thinking. This is just paraphrasing your clause.

Have you any evidence to back this up? This is what the dealer tells me, that they had to amalgamate to stay in business.

Mr. HENDERSON: They had to start all over again.

Mr. HORNER (*Acadia*): Have you any figures to support that?

Mr. THIESSON: This conclusion is taken from the hearings of 1937. We say that we believe that many of the findings of this committee may still hold true today.

Mr. HORNER (*Acadia*): You do not have any figures to support that belief? Twenty-three years have gone by.

Mr. THIESSON: That is right, but you have had tremendous reorganization within the farm implement industry. Examine, for example, the comparative farm implement sales in 1937 and 1959. There is no comparison there.

Mr. KORCHINSKI: What would a fair profit be?

Mr. THIESSON: This, of course, is going to be one of your problems, what the fair profit is.

The ACTING CHAIRMAN (*Mr. Forbes*): I wish to thank members of the committee for their cooperation, and to express the appreciation of the committee to the witnesses this afternoon.

APPENDIX "A"

INDEX NUMBERS OF FARM PRICES OF AGRICULTURAL PRODUCTS (1)

(1935-39=100)

	CANADA	P.E.I.	N.S.	N.B.	Que.	Ont.	Man.	Sask.	Alta.	B.C.

APPENDIX "B"

Summary Farm Machinery Questionnaires

Dist.	Local	Dist.	Local
1	South-West Estevan	11	Kingsland
1	Glenwood	11	Bickleigh
1	Oxbow	11	Smiley
1	North Estevan	12	Needwood
1	North Weyburn	12	Reford
1	Marmora	12	Cavell
2	Assiniboia	12	Queenston
2	Avonlea	13	Creekview
2	Lafleche	13	Cory
3	Milly	13	Elstow
3	Stone	13	Blucher
4	Lemsford-Protreeve	13	Rapid Advance
4	Antelope	13	Perdue
5	Vanguard	13	Arelee
5	Keeler	14	Daphne
6	Glenn Lynn	14	Petaigan
7	Windthorst	14	Pipestone Creek
7	Northwood	14	Valparaiso
7	Moosomin	14	Nora
7	Grenfell	15	East Prince Albert
8	Poplar Point	15	Red Deer Hill
8	Calder	16	Halcyonia
9	Crosssthaite	16	Big Gully
9	East Lynn	16	Sewton-Tebo Corner
9	Raymore	17	Sun Valley
10	Loreburn	There were two additional questionnaires who did not give the name of local.	
10	Wheat Plains		
10	Maple Dale		

Question No. 1

What problems do you feel affect you most in the operation of farm machinery?

- (a) Prices too high? 56
- (b) Poor local service? 29
- (c) Availability of parts? 41
- (d) Poor construction 28 (There were a few reservations here . . . poor construction in some things, not all)
- (e) Others:
 - Variations in price on accessories
 - Companies change their models so often it is impossible to give service or carry repairs.
 - Forced to buy too much to get one small part.
 - Poor transportation of parts.
 - Too many extras, very handy but too costly.
 - Poor service beyond local. Distributing points not adequately stocked. (2)
 - Repairs too expensive, down to bolts.
 - Poor warranty and manufacturer can't even stand up to this warranty. (2)
 - Poor shipping service (carelessness in handling)

Inferior material in cast.

New type tractor seat may not be as safe as old low type.

Not enough research and field testing before being put out for sale.

Trend toward fewer service centers must be stopped.

Farmers still regard local home-town agent as indispensable.

Wholesale repair companies depend on local dealers far too much to stock repairs that will be needed.

Poor assembling (3)

Some unnecessary changes, compelling new repairs for each year model, where second-hand repairs could be used.

Dealers cannot be expected to stock parts for all models of machinery now on market. Too many models.

Complicated parts for machinery, which are beyond ordinary farmer and his equipment to repair.

Question No. 2

Give any specific examples you have with respect to any of the above problems.

Oil filters too high.

Agent sold tractor and wouldn't go out to service it.

Forced to get machinery administration to get parts.

Had to go out of district to get some parts, and out of Canada to get others. (4)

Parts not available for fingers for auger of combine.

Screens not available.

Late model cars even held up because trunks, etc., not available.

Clutch parts not available in Canada or U.S. for tractors

Prices too high in comparison to prices of grain.

One person tried to get a diesel tractor operating properly for two full years.

One company went from the 80 series one year, then 820, 830, and now a complete change. This is true of nearly all makers.

Tractor 1½ years old held up for parts for three weeks. Break due to poor construction.

Prices never stop going up.

Dealers are more interested in selling new stock than servicing the old.

One gear ordered for tractor in July; finally this gear was obtained from a wrecking company in October. (Original order arrived at same time, but was returned).

Repairs for a new side valve purchased in July ordered in July not received yet.

Hydraulic pump on combine broke and 10 days good combining were lost.

Feeder chain drive on same make of combine took three months for repairs.

If parts were standardized so that such things as V belts, sprockets, shafts, could be used on different machines, the dealer wouldn't have to have such a big stock of parts on hand.

On a tractor only a small part was needed on the governor, and a complete unit had to be purchased. Numerous similar cases were discussed.

A neighbour bought a new combine this fall and soon after use broke a shaft. He waited all fall for the necessary repair and I believe still is. If he had been wholly dependent on that combine he would have lost his entire crop because of unavailability of parts and poor local service.

- A transmission broke down on a tractor at seeding time. Required a new gear. Finally found gear, but not the burr. Burr had to be ordered from Saskatoon. Took 2 weeks to get it, and when it did come it was the wrong one. Came with a fine thread, should have been coarse thread. Farmer then had to rely on his neighbours to get his crop in.
- Axle for one make of combine not available at Raymore, Ituna, Lipton and Regina this fall. Guards for another combine and swather could not be got in Regina.
- Distributing centers don't always have parts available and farmers are forced to wait for parts for 2 or 3 weeks or more at critical times.
- One farmer ordered a new carrier chain in May and did not receive it in time for harvest.
- Excessive pressure by hydraulic pump for type (strength) of hose supplied. Result—burst hoses.
- Although we realize there are certain taxes left off agricultural machinery, the prices are still too high for our current rate of income.
- On a diesel tractor, the housing cut out. Needle bearings got into cam gears and bent cam shaft. Had to replace timing gears, rod bearings, crank shaft, cam shaft, all pumps and repair fuel pump. Nine weeks hold-up due to repairs not being available.
- Local farmer bought new tractor June 1960. Hitch, hydraulic controls, etc., were not available at that time. Engine not completed until October 27.
- Farmer could not get baler repairs until season was over—had to hire all baling done.
- Repairs not available in harvest time, e.g., combine teeth, swather knives and canvasses, chain links for baler. These implements were not more than four years old.
- Farmer had a tractor tied up for three months waiting for parts.
- Combine \$9000—nearly as much as a half-section. Pull type combine—no motor—\$4700.
- Spool on hydraulic 1953-4 tractor—back-ordered at least 3 months—man using tractor—hydraulic oil leaking.
- Needed gear for tractor—no parts in western Canada.
- No parts available for immediate delivery.
- A baler part took 3 weeks to come so hay that was laying out lost a lot of quality.
- Most companies have only one branch house or repair depot in a province, and local dealers can't possibly have all repairs, so you are forced to make trips for repairs as far as 2 to 3 hundred miles, especially in combining seasons when you can't wait for any length of time.
- Hard to get service men.
- Oil pan leaked the first half day on new combine. Did 150 acres and the drive wheel housing and bearing went.
- Bought a diesel tractor—never worked properly. Uses too much fuel and no service in this town.
- Pool welding on many farm implements—(at least 2)
- Trade-in prices on new machines out of line. Trade-in of $\frac{1}{2}$ ton truck on a new truck was allowed \$1100 off price of new truck—was later sold for \$375. On a deal for a new combine, and 1950 was taken as a trade-in and allowed \$2200. Besides this, the originally quoted price was dropped \$1800.
- Prices of repair parts is inconsistent between dealers, although everyone goes to their price book. Farmer purchased set of pick-up teeth for combine in Birch Hills for half the price of a set he purchased in Prince Albert.

Bearings, belts and chains can be obtained from independent jobbers for a fraction of the price asked by company dealers, e.g., a dealer asked \$2.40 for a bearing, and jobber charged 60¢ for same bearing.

Poor local service: When part isn't available in P.A., dealer says he will phone Saskatoon and charges customer for the phone call. After he has had 3 or 4 farmers pay phone charges he calls Saskatoon and orders everyone's repairs in one call.

Poor service—won't take back a repair part when asked to.

Farmer had a wheel on tractor governor go. When he asked dealer for it was told he must buy entire assembly. When he asked why there was a number on the part and decided to order elsewhere himself, they found needed part in stock, accidentally.

Too much time lost waiting for parts that must be ordered. Dealers do not stock an adequate supply and then only order one at a time.

Labor charges on assembling parts is too high and is often done by unskilled labor and not done properly.

Price quoted before ordering is upped after part arrives.

Availability of parts: Many farmers travel many miles to smaller points to obtain parts they can't get in Prince Albert. Parts are also cheaper in Smeaton and Birch Hills than in Prince Albert, even though they pay extra express rates.

Some makes of machinery, e.g., sprayers, were made and sold and after three or four years they disappeared and parts are not available.

We do not think we should have to pay both freight and phone charges on repairs.

We feel that with transportation as efficient as it is today, repairs should be available within 24 hours.

One farmer has tractor in shop in town for 30 days, waiting for small repair. Reason given: company taking stock in warehouses and not sending out parts.

Closing out of local dealers is big problem, making farmers travel long distances for parts. (2)

Trouble in power steering which gave out during harvest. Parts were slow in arriving. Time lost over three weeks in harvest.

Machine agencies are forcing farmers to buy new machines they can't afford to buy.

Question No. 3

What recommendations would you make with respect to farm machinery that would improve the position of the farmer? (such as standardization of parts, being able to buy assembly parts, etc.)

Parts too varied for models of certain machines. Shipments of new machines often found upon arrival to be minus parts, etc.

Standardization of parts. (38)

- Some specified certain parts that should be standardized.
- Several said similar parts on different makes should be standardized.
- Some recommended interchange of parts.

All machinery should be tested by an independent agency.

There should be fewer models.

Parts should be available in Saskatchewan (Regina). Farmers don't mind waiting a few hours for them to come down.

Standard wheels would help.

Makers should not keep changing models. Then they wouldn't have to retool nearly as often. The local dealers wouldn't need to carry such a large stock. (8)

- Should not be obliged to buy whole assemblies when only one part is required. (10)
- Lower prices and tariffs.
- Sometimes repairs will not fit although they have the same number.
- Oil filters should be standardized.
- Different companies sell same piece for different price, and quality isn't standardized either.
- For better local service the manufacturer should supply the dealers with the necessary parts on consignment. The waiting period is way too long to wait for parts.
- Do away with blockman's 10% on all sales.
- Prices should be standardized on new machinery and parts.
- Should be able to buy assembly parts with idea of building own machines. (for those who are handy with torch and welder)
- Suggested that all machine companies amalgamate and build only one line of tractors and other farm machinery. Machines built to work as they should under actual farm conditions before being released for sale.
- We believe that a machine, for example a combine, should not have more than possibly 3 or 4 different bearings or bushings and if used by most companies, they could be interchangeable and these 3 or 4 bearings to be used on balers, mowers, forage harvesters, and other implements also.
- The companies haven't enough trained mechanics to service the machines they sell.
- A farmer should have a machine on a 30-day trial.
- Extend credit to dealers so that stocks may be kept on hand and complete.
- Retooling and testing of new models increases prices of machinery needlessly, and farmer pays.
- Cut out the dealers, salesmen, blockmen, etc.
- Eliminate charge of phone-call re machinery to customer.

Question No. 4

Other comments and/or examples:

- Too far between dealers in some cases. Limited supply of parts, i.e., a lot of parts must be ordered from Regina which is 125 miles or more and means 2 or more days' delay.
- Implement companies should be forced to supply agents with repairs on consignment.
- Streamlining not necessary and extra expense on labor at service time.
- Tractor series changed too often.
- It is particularly considered important to farmers that adequate repair supplies be kept on hand in harvest time, when every nice day counts.
- The enquiry should investigate activities of Sask. Agric. Mach. Adm., and its work on testing machinery on service and repairs, etc. This board could be enlarged and is doing valuable work.
- Examples of farmers forced to buy another combine because parts were unavailable for the one they had.
- Responsibility for parts of manufacturer should be extended from ten years to twenty years. Tractors should be equipped with magnetos.
- Canadian industries are unreasonably competitive and don't have to be because of the ridiculously high tariffs imposed on us to protect them. It's also causing an unbalanced trade with the wrong countries.

- Machinery costs have risen out of all proportion to the ability of the ordinary farmer to purchase.
- Cost of the equipment is preventing lots of young farmers from getting started, also hampering established farmers of ameliorating their position.
- Tractors should have a working speed of 4 to 4½ miles per hour. Lots of tractors do not have a gear in this range.
- Have to wait too long for repairs. Branch houses and depots do not keep an adequate supply of parts on hand to serve the dealers.
- If the manufacturers would concentrate on quality rather than quantity the problem of parts would not be so acute.
- Machinery construction can be approved a lot for better performance and safety. The warranty period on haying, harvesting and seeding machinery should be based on about 600 working hours, or three years, whichever occurs first, rather than the 12-month period from date of purchase.
- We suggest that the farmer be able to deal directly with the company instead of with the individual dealers.
- We think dealers should stock more parts. Suggest company supply dealers with repair parts so dealers would not have to buy parts themselves.
- Since the value of sealed bearings is still in question, we believe the purchaser should have the option of choosing between a machine equipped with sealed bearings and one equipped with conventional grease bearings.
- More and better qualified service men.
- There were complaints that machine companies do not keep in close enough contact with their products to know their weaknesses. It is practically impossible to get service men and dealers to check new machines.
- Implement companies need to work for improvements and corrections on models continually but why the necessity for new models annually, the overhead cost of which results in exorbitant costs to the users?
- Have parts more readily available is the greatest complaint, and reduce prices of parts and machinery. Better distribution of parts needed as well.
- The parts service is lousy. The back-order deal is something which needs to be looked into. The men here feel that the dealers are using the term "back-order" to their own advantage, not really caring how the farmer is feeling in the pinch.
- If parts were stocked in a central point where they could be ordered and received faster, service would be improved.
- More use of AMA results by farmers.
- PTO speeds should not change till all machines are standardized to receive it.
- One member gave examples of prices—a bill hook for a binder knotter used to cost about \$2. This fall he paid \$8. A table canvas for the same machine used to cost \$10. New price \$26.
- "Suggested retail price" gives dealer too much leeway in price setting. Suggest a set single price, province-wide for each repair, etc.
- Bearing or pulley on one company's swather are not sold separately.
- Habit of machine companies of adding 10% to old stock as machine parts go up in price.
- Parts duplicated in new model machines not to be different numbers and prices from previous models.

HOUSE OF COMMONS
Fourth Session—Twenty-fourth Parliament
1960-61

STANDING COMMITTEE
ON

Agriculture and Colonization

Chairman: JAMES A. McBAIN, Esq.

MINUTES OF PROCEEDINGS AND EVIDENCE
No. 5

Respecting
PRICES OF FARM MACHINERY

MONDAY, MAY 1, 1961

WITNESSES:

From Massey-Ferguson Limited: Messrs. T. J. Emmert, Vice-President; W. J. Forsyth, General Sales Manager; N. H. Penney, Comptroller; D. W. H. Denton, Director, Personnel and Industrial Relations; J. G. Kingsmill, Assistant Comptroller; L. J. Child, General Traffic Manager; R. M. Snelgrove, General Attorney; H. L. Hickey, General Public Relations Manager; J. A. Alexander, Manager, Field Services.

ROGER DUHAMEL, F.R.S.C.
QUEEN'S PRINTER AND CONTROLLER OF STATIONERY

(Quorum 15)

Clyde Lyons,
Clerk of the Committee.

ORDER OF REFERENCE

FRIDAY, April 28, 1961.

Ordered,—That the name of Mr. Horner (The Battlefords) be substituted for that of Mr. Slogan on the Standing Committee on Agriculture and Colonization.

Attest.

LÉON-J. RAYMOND
Clerk of the House.

MINUTES OF PROCEEDINGS

MONDAY, May 1, 1961.
(8)

The Standing Committee on Agriculture and Colonization met at 9.35 a.m. this day.

The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Badanai, Campbell (*Lambton-Kent*), Clancy, Clermont, Cooper, Danforth, Fane, Gundlock, Hales, Henderson, Hicks, Horner (*Acadia*), Horner (*Jasper-Edson*), Horner (*The Battlefords*), Howe, Knowles, Korchinski, McBain, Milligan, Muir (*Lisgar*), Nasserden, Noble, Pascoe, Peters, Phillips, Rapp, Regnier, Rogers, Smallwood, Southam, Stefanson, Tardif, Thomas, Tucker and Webb.—(35)

In attendance: From Massey-Ferguson Limited: Messrs. T. J. Emmert, Vice-President, North American Operations; W. J. Forsyth, General Sales Manager—Canada; N. H. Penney, Comptroller, D. W. H. Denton, Director, Personnel and Industrial Relations; J. G. Kingsmill, Assistant Comptroller—Financial Analysis; L. J. Child, General Traffic Manager; R. M. Snelgrove, General Attorney; H. L. Hickey, General Public Relations Manager; and J. A. Alexander, Manager, Field Services (Public Relations).

The Chairman explained the non-appearance of the Canadian Labour Congress on April 24th. The Committee agreed to hear their brief on May 29th.

The Chairman introduced Mr. Emmert who, in turn, introduced the members of the Massey-Ferguson delegation and called on Mr. Alexander who read Section A of the brief during which Mr. Emmert displayed and explained graphs and charts contained as appendices to their brief.

The Chairman informed the Committee of the personal background of Mr. Emmert.

The Committee questioned the officials of Massey-Ferguson Limited on the contents of their brief.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON MEETING (9)

The Committee reconvened at 2.30 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Campbell (*Lambton-Kent*), Clancy, Clermont, Cooper, Danforth, Fane, Gundlock, Hales, Henderson, Horner (*The Battlefords*), Horner (*Acadia*), Horner (*Jasper-Edson*), Howe, Knowles, Korchinski, McBain, McIntosh, Milligan, Montgomery, Muir (*Lisgar*), Nasserden, Pascoe, Peters, Phillips, Racine, Rapp, Regnier, Smallwood, Southam, Stefanson, Tardif, Thomas, Tucker and Webb.—(34)

In attendance: Same as at morning sitting.

Moved by Mr. Korchinski, seconded by Mr. Southam,

Resolved,—That the appendices to the Massey-Ferguson Limited brief be made appendices to this day's Minutes of Proceedings and Evidence. (*See B, C, D, E and F.*)

The questioning of the officials of Massey-Ferguson Limited continued.

Mr. Horner (*Acadia*), seconded by Mr. Gundlock, moved that the Committee ask Massey-Ferguson to prepare cost figures for the Committee, a breakdown of various cost items such as labour, materials, salaries and distribution for a number of years in making a tractor, combine, manure spreader and plough.

After discussion, the Committee adjourned at 5.15 p.m. to meet at 8.00 p.m. *in camera*.

EVENING SITTING

(10)

The Committee reconvened, *in camera*, at 8.00 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Campbell (*Lambton-Kent*), Clancy, Clermont, Danforth, Doucett, Fane, Gundlock, Hales, Henderson, Hicks, Horner (*The Battlefords*), Horner (*Acadia*), Horner (*Jasper-Edson*), Howe, Korchinski, Lahaye, McBain, Milligan, Nasserden, Pascoe, Peters, Racine, Rapp, Regnier, Ricard, Smallwood, Southam, Thomas, Tucker and Villeneuve.—(29)

In attendance: Dr. P. M. Ollivier, Law Clerk.

The Committee resumed discussion on Mr. Horner's motion and amended it to read: "that this Committee request all machinery companies appearing before this Committee to supply by years, from 1954 to date, a cost breakdown of the material, wages, salaries, and distribution which go into the manufacture of such items as tractors, combines, manure spreaders and balers".

Dr. Ollivier gave his opinion to the effect that the motion was in order and within the Committee's Order of Reference.

The motion passed unanimously.

At 8.30, the witnesses were recalled.

In attendance: Same as at afternoon sitting.

The Committee resumed the questioning of the officials of Massey-Ferguson Limited.

Mr. Clermont moved, seconded by Mr. Racine, that this Committee be adjourned to allow the members of the Committee to be in the House of Commons where they are studying Bill C-77.

The motion was negatived on the following division: YEAS: 3; NAYS: 22.

The questioning of the witnesses continued.

Mr. Horner (*Acadia*), moved, seconded by Mr. Milligan, that all machinery companies appearing before this Committee present figures for the years 1954 to date regarding numbers of employees in each of the following categories: administration, production and distribution, and that they give aggregate amount of wages paid in each case.

In amendment thereto, Mr. Thomas moved, seconded by Mr. Muir (*Lisgar*), that this motion be referred to the subcommittee on agenda and procedure.

The amendment was negatived on the following division: YEAS: 7; NAYS: 8.

Mr. Horner's motion carried on the following division: YEAS: 12; NAYS: 5.

The Chairman read a letter from Cockshutt Farm Equipment Limited requesting a postponement in their appearance before the Committee. It was agreed to re-schedule their appearance for June 5th.

At 10.15 a.m. the Committee adjourned until Tuesday, May 2nd at 2.30 p.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

MONDAY, May 1, 1961.

The CHAIRMAN: Order, gentlemen. I believe we have a quorum this morning.

Before I introduce our witnesses, I feel you probably would desire to have an explanation as to why there were no meetings last week. To start with, I hope you all have received through the mail a number of copies of returns and letters. This was information you had asked from Dr. Andel and Mr. Haase. They give you answers to the questions which were raised by various members at a previous meeting.

I feel I should say a few words about the non-appearance of the Canadian congress of labour, scheduled to appear on Monday, April 24. You will remember that your subcommittee sought and received approval from you to have the Canadian labour congress present their brief before the appearance of the machinery companies.

After setting one date which was not suitable to the congress, we received confirmation that they would appear on April 24.

At 8.00 a.m. on Friday, April 21, Mr. Lyons received a call at his home from Mr. George Burt, Canadian director, Canadian region, United Automobile and Agricultural Implement Workers union. Mr. Burt was to present the congress brief. The congress did not want to appear on Monday. Mr. Lyons arranged an appointment between Mr. Burt and myself at the conclusion of Friday morning's sitting. Mr. Burt did not want to appear without some other officer of the congress being present. Apparently the other officers were in South America or out in western Canada.

I explained to him that the committee wished their appearance before the machinery company briefs were heard and I suggested Friday, April 28. This date did not suit him, either.

Apparently the first date that suited was May 29. I told him I would put this date for their appearance before the committee. You will note that May 29 is after all the machinery companies have been heard. Is it your desire that we allow the Canadian labour congress to appear on May 29?

Mr. HORNER (*Acadia*): Yes.

The CHAIRMAN: I take it it is agreeable that they appear on May 29. I should also inform you that additional meetings have been scheduled for Monday, May 22, John Deere Company; and Friday, May 26, Saskatchewan wheat pool.

We have also been informed by the Canadian Co-operative Implements Ltd. that although they would be submitting a brief, none of their officers would make an appearance. Mr. John B. Brown, president of C.C.I.L. wanted to present the brief, but he is absent from Canada and will not return until June 17.

Gentlemen, this morning we are very pleased to have with us the Massey-Ferguson implement company and a number of officials from that company. I would like to introduce Mr. T. J. Emmert, vice-president. Mr. Emmert will introduce the other members of the delegation.

Mr. T. J. EMMERT (*Vice-President, Massey-Ferguson Ltd.*): Thank you, Mr. Chairman. Gentlemen, we welcome the opportunity to appear here today. Our directors have indicated to us very strongly that we should co-operate with the committee's objectives to the fullest extent. We believe we have done

so in preparing the brief, and in order to ensure that we fulfil the desire of our board I have with me to-day a number of my associates in the company. I would like to introduce these gentlemen to you.

Mr. W. J. Forsyth is our general sales manager for Canada. In that capacity he is responsible for all the activities of Massey-Ferguson in the field; that is to say Mr. Forsyth carries responsibility for sales, service, the operation of our branch houses and, in fact, everything that goes on with respect to our business, except that which is conducted at the head office or in the factory.

The remainder of the Massey-Ferguson men here carry responsibility also for North American affairs; that is to say their activities extend to all North America as well as to Canada.

We have Mr. Norman Penney, the comptroller for North American activity. Mr. D. W. H. Denton is director of personnel and public relations. Mr. J. G. Kingsmill is an assistant of Mr. Penney's and he is in particular responsible for financial analysis. Mr. R. L. Selgrove is our general attorney. Mr. L. J. Child is our general traffic manager; Mr. H. L. Hickey is our general public relations manager.

At this point, Mr. Chairman, with your permission I would like to call on Mr. J. A. Alexander, who is manager of our public relations field services, to read section A of Massey-Ferguson's brief. Is that satisfactory?

The CHAIRMAN: Would it be satisfactory to the committee if section A is read now? Very well.

Mr. EMMERT: I should mention that as Mr. Alexander proceeds with the reading of section A we have several visual aids and I would like to interrupt him from time to time to explain the purpose of these aids.

Mr. J. A. ALEXANDER (*Manager, Public Relations Field Services, Massey-Ferguson Limited*):

Last August, when Massey-Ferguson was invited to submit a brief to the standing committee on agriculture and colonization, our board of directors agreed at once to give full cooperation to your objectives.

It therefore became my assignment, as a vice president of the company—with responsibility for its operations in Canada and the United States—to supervise the preparation of the material filed with your committee and to present it to you at this time. We welcome the opportunity to appear here today and to lend support to your enquiry under the following terms of reference:

"That the standing committee on agriculture and colonization be empowered to enquire into the prices of farm machinery and to report to the House thereon".

At the outset, I believe it would be fitting to draw to your attention a few salient facts about a company whose history and traditions have been interwoven, for more than a century, with the development of Canada itself. Massey-Ferguson is proud of its long record. Our history as a company dates back to 1847—20 years before confederation. We are one of the few Canadian-based companies that has become truly international in scope. We have 24 factories in 10 countries, and market our products in 142 countries on all continents. It may interest you to know too that in 1960, while only 12.6 per cent of our total sales were in Canada, our combined sales in Canada and the United States represented 42 per cent of the company's consolidated world-wide volume.

In Canada we have our corporate office, our North American headquarters, six factories, an experimental farm and an engineering test track. We have some 6,400 employees, maintain five major branch centres and have a dealer

organization located in 900 rural communities. As a major manufacturer, we are substantial purchasers of Canadian goods and services—thereby providing additional employment and helping to stimulate the national economy generally.

It is significant to record, too, that the ownership of Massey-Ferguson is broadly based, with 42,000 shareholders—and almost 85 per cent of the shares are held in Canada. Thus, the shareholder-direction of our world-wide operations is basically Canadian.

Strong Management Imperative

In this broad portrayal of our company I have attempted to point up the responsibilities that are inherent in our position as a leading business organization in the economic life of Canada. The management of Massey-Ferguson is responsible to its shareholders for handling more than \$200 million of the money they have invested. In working for those who have chosen to participate in the growth of the organization we are deeply sensitive of the need to provide them with earnings comparable to those of other companies or institutions in which they could invest. Only then can we continue to command the capital necessary for efficient operation and for expansion.

Recognizing our responsibility in this regard, we have no hesitation in stating that we are in business to make a profit. We would state further that over the post-war years, our profits have been far too low. In recent years, Massey-Ferguson management has informed its shareholders that it is making very extensive changes in organization and in management policies which, it is fully expected, will yield higher returns. At the same time, we assure our farmer-customers that we are giving them the most they can presently get for their money; and we are determined to give them still more value as we progress.

We are pursuing aggressive policies—of necessity, rather costly ones. In the area of research and development of agricultural machinery, our goal is to give our farmer-customers machinery which is particularly adapted to their special needs, at the lowest price at which it can be supplied—machines which permit farmers to achieve rapidly increasing gains in efficiency of production. Similarly, in the areas of production and marketing policy, distribution, dealer and customer services, financial management, labour relations, and transportation, we are putting forth our most aggressive efforts to improve the efficiency of our organization. We recognize that our success will mean gains for our shareholders, for our employees, and for Canadian farmers. Our brief to you today will give you an insight into our activities in each of these fields over the post-war years, the period that we feel is of greatest interest in the present enquiry.

At Massey-Ferguson we have the task of keeping under constant review, the prices of some 120 pieces of machinery and equipment, and 85,000 parts sold in the North American market. We wish to make it unmistakably clear that, in pricing, we are guided overwhelmingly by considerations of the market. We must be sensitive to preferences of our farmer-customers and to the general tone of the market which reflects the state of the farm economy of the country, and we must be competitive.

The emphasis we place on demand in pricing our products is no denial of the importance of costs in our business; but this importance is in terms of internal adjustment of our operations. Costs must be met over a period of years; otherwise the manufacturer goes out of business. This is the major significance of costs.

As to capital investment and earnings, our submission to your committee at this time contains the same information as provided in connection with the royal commission on Canada's economic prospects, up-dated to 1960. (See page

41 of publication "The Canadian agricultural machinery industry", by J. D. Woods and Gordon, Limited, April 1956). Through this information it is clearly evident that, in recent years, the prices we have charged for our products have not covered costs and provided a fair capital return.

Mr. EMMERT: Gentlemen, although this information is in tabulated form, we thought it might be deserving of a visual look concerning what we are talking about. These two lines represent Massey-Ferguson's world-wide sales in terms of millions of dollars, and Massey-Ferguson's net income also in terms of millions of dollars. It simply serves to portray graphically what we have set forth in some detail in accordance with the principles established by the royal commission report on agricultural machinery. These aids will be available in the room all day, if you care to look at them.

Mr. PASCOE: Will they be reproduced in the hearings?

Mr. EMMERT: In appendices in tabular form.

Mr. KORCHINSKI: Could we not have this information as an appendix to our proceedings?

Mr. EMMERT: We will be very happy to reproduce the charts.

Mr. HORNER (*Acadia*): That is all in the exhibit.

Mr. EMMERT: It is in tabular form. Members would like it in graphic form and we would be delighted to do it.

The CHAIRMAN: This will all go into the proceedings today. If those charts are not the same as already in the appendices, they will be reproduced.

Mr. KORCHINSKI: Some people who are not at this meeting might be reading these proceedings, and if you make reference to these charts, they will not know what it is all about.

Mr. EMMERT: We will reproduce it for you.

Mr. ALEXANDER: Let me assure you that to remain competitive, we must constantly devise means of securing economies in production. One might say this is the biggest job of management. We react to demand as we find it, and make every possible internal adjustment on the side of costs—here, and only here, lies our opportunity for profits. And, even on the side of making internal adjustments with respect to costs, we face grave limitation. Our biggest cost elements are steel, labour, and transportation; and over none of these have we any significant control. Thus, the area of our own discretion, even on the cost side, is limited to the manner in which we organize our manufacturing and marketing procedures. These, like our pricing, are under constant review and changes proceed continuously.

We are proud of the management team we have at Massey-Ferguson—professional management people in the farm equipment business. But, we have told them and have told the share-holders, that since the quality of management, along with research, development, and product innovation, are the only areas where we have significant control over our business, we must do a still better job. Thus, over the last 12 to 18 months. I have presented our North American management team with a challenge to greater managerial innovation. If the challenge is not picked up, I know, and every member of the management team knows, how serious the consequences could be.

I express the business "facts of life" in these terms because they represent, better than any other way I can command, the approach to corporate organization at Massey-Ferguson. This is the accepted approach of strong corporate organization and I defend it. In telling our shareholders, we have told the public, and told our competitors that we are determined to secure a larger share of the North American market for agricultural machinery. To accomplish this, we have to produce a better product, produce it more cheaply, and price it so

as to get an increasing share of the market. In doing this, our policy is fully consistent with the welfare of the Canadian farmer and of Canada. Without this, a free enterprise economy has no meaning.

I cannot stress too strongly our concept of a competitive Canadian economy. Summarizing the accepted position of the country's leading economists, we would claim that free enterprise is neither a private prerogative nor a right, but a public privilege open to everyone.

What the Canadian people give through their government, when it charters a company, is the right for the company's shareholders to expose their capital to risk and to make profits or losses. Whether there are profits or losses depends almost entirely on the general public in the exercise of its freedom of choice amongst competitive businesses. Thus, the importance we attach to demand is dictated by the public. It is sole judge. All forms of business organization exist at the pleasure of the public—particularly the corporation, which owes its very existence to public charter. With this grant of powers, the corporation must demonstrate its competence in a fair field of competition.

A North American (Canada and United States) Industry.

Before proceeding further, I should like to make unmistakably clear, a point of greatest importance. While Massey-Ferguson in origin, development, and ownership is a Canadian company, there is no longer such a thing as a Canadian farm machinery industry serving only the Canadian farmer.

Since 1944, when the last tariffs were removed, there has been a common market for agricultural machinery between Canada and the United States. While this has certain advantages to us, in giving us access to the large United States market, it means that in return we must bear the full brunt of competition in Canada from United States-based companies. While there have been suggestions that a measure of tariff protection should be accorded the Canadian farm machinery industry, no such view has emerged from Massey-Ferguson. The market in which we compete on this continent is North American in scope—not two markets in two separate countries—but one all-embracing continental market. Farm machinery moves freely across the Canada-United States boundary line in both directions. To companies in this industry, the international border is of very limited market significance.

Mr. EMMERT: This is a map of North America defined as that geography consisting of Canada and the United States. This is the borderline. Its only importance in our industry is one bearing on the administrative procedures. We are still required to have a lot of paper flow within our company in order to have goods passed over that border. It is not an economic barrier however. This market south of the border is roughly eight times the value to the farm equipment industry. If it were not for our ability to transport goods back and forth across this border, without economic cost, Massey-Ferguson could not compete in the world's largest agricultural equipment market in the United States, and if that were not so, then the Canadian farmer would be obliged to pay the penalty of a smaller production unit within North America. This we consider to be an essentially important fact of life in this agricultural equipment industry with which we are dealing.

In this submission, therefore, our horizon must be North American, not Canadian alone. We cannot, for economic reasons, manufacture all of our products in Canada; nor can we produce in our Canadian factories all the machines we require to serve the Canadian market. It is our practice, however, to manufacture in Canada as much as we possibly can. It pleases us to observe that at least some of our larger competitors appear to be following our pattern in this regard.

Specialization of factories on both sides of the border to serve the entire North American market has permitted the realization of very substantial economies which are passed on to farmers in the two countries.

Massey-Ferguson produces all of its combines and balers for the North American market in Toronto; it produces its entire North American tractor output for this market in Detroit—and these have a high proportion of components brought from the United Kingdom. This is so because these components are used in tractors produced for all parts of the world. A substantial number of tractors, for the Canadian market, is produced in our British plants. I should point out that, in this continental market, Massey-Ferguson prices its products to Canadian dealers at prices no higher than those accorded our American dealers. We feel that Canadian farmers clearly gain from the continental orientation of our industry.

Another very important implication of Massey-Ferguson operations in the continental market is in our large volume of exports of Canadian-made products to the United States. Over the period since 1949, the favourable net balance of trade with the United States resulting from the operations of our company was \$460 million.

Massey-Ferguson and the Agricultural Industry.

Our organization is very much aware that while cash farm income has generally been maintained, there has been a general decline in the net and real income position of the Canadian farm industry. Our sales are very sensitive to farm incomes. The instability which characterizes farm incomes affects to a large extent the income or earnings of our organization. Our position in the Canadian economy is inseparably linked with the financial health of the farm community. Farm incomes are far too low as related to the amounts of labour, management, and capital that go into agriculture. We very much hope that the adjustments through which the farm industry is passing will lead to stabilizing returns at a much higher level. We would point to the fact that in maintaining prices of our machinery to Canadian farmers at levels no higher than those faced by American farmers, we are aiding in keeping Canadian farm costs down. This we can do by achieving large volume sales—possible only because we have free access to the large United States market.

Mr. EMMERT: Again, this is simply a graphic illustration of material which is in one of the appendices. The top line, which is green, represents the output of Massey-Ferguson Canadian factories in terms of millions of dollars. The difference between the green and the orange line represents shipments to markets other than Canada or the United States. It is apparent, as the years have progressed, that we have lost our ability to compete in export markets,—that is, outside the North American continent.

The band between the orange and the red line indicates the production of our Canadian factories which has flowed into the Canadian market. The area below the red line indicates our Canadian factory production which has been sold in the United States market. These shipments to the United States, and our ability to impinge upon the world's largest market below the border, is one good reason for our ability to keep the prices to Canadian farmers and to our dealers in Canada literally at no higher levels than the prices charged to American dealers. I would call to your attention, and to the members of the committee, that this price position on farm machinery—that is to say, where goods are sold for the same price in Canada as in the United States—is in marked contrast to the price position on other leading consumer goods such as automobile products, household equipment, and so forth.

Contrast the price position of our farm machinery in the United States and Canada with the position of such leading consumer items as automotive products, household equipment and so on.

Pricing and Financial Aspects.

Massey-Ferguson net income after taxes in 1960 on world-wide operations, amounted to 2.7 per cent of each dollar of sales. For the years 1954 to 1960 inclusive, world-wide sales were \$2,774 million and net income was \$63 million, or about 2.3 percent of net sales. This could scarcely be described as a situation where the prices of farm machinery could be identified with high profits. On this continent since 1948, our traditionally more profitable export sales have largely disappeared and have been replaced with less profitable sales in North America. Restriction on purchases in the dollar area by sterling countries was, of course, an important factor.

Actually, our advantage represented in the original development of the self-propelled combine gave Massey-Ferguson a spectacular share of the North American market in the immediate post-war years. This more than offset the loss of export markets outside of North America; but it lasted only three years, by which time our competitors had acceptable self-propelled combines. Defence sales, mainly in the United States, aided in maintaining the earning position of the company until 1954. Since that year, we have faced increasingly vigorous competition in what has become clearly a buyer's market. This market situation is associated with a customer demand for an expanding range of products and for fully adequate parts and servicing facilities; and, during this entire period, the farmer-customer has been purchasing increasingly on credit. These circumstances inevitably have increased the cost of investment in dealer inventory, and in providing marketing distribution, and servicing facilities. The rigours of living in this highly competitive industry have accounted to some extent for our declining earnings. But, we are determined to overcome these difficulties by selling higher quality products at fair prices and by giving more and better service.

Massey-Ferguson, for certain factors of production, has to pay on a basis determined by the market and general economic conditions. This is reflected in the fact that farm machinery prices have risen generally in line with the cost of steel and labour.

In an accompanying statement, we show details of our standard net recovery from dealers on four important Massey-Ferguson machines. These prices follow much the same trend as the dominion bureau of statistics retail farm machinery price index over the post-war period. In these comparisons, we emphasize the new features built into these machines year by year, as well as the general improvement in quality. It is significant that the steel we use has risen in price by 88 per cent since 1947, and our hourly labour rates have risen by 117 per cent since 1947. These increases in our largest items of cost compare with a 101 per cent increase in the price of farm machinery since 1947. It is apparent, therefore, that farm machinery prices are not out of line with the costs of steel and labour.

Engineering, Research and Development.

One of the great virtues of competitive enterprise is that it compels manufacturers to develop and offer to the customer better, more efficient products. In fact, we might say that the most insistent demand for innovation comes from the customer. We know this through the work of our product planning, marketing and engineering functions, which maintain close contact with Canadian and American farmers.

At Massey-Ferguson, we are mindful of the importance of engineering research and development. I am not speaking platitudes when I say that we are dedicated to the development of machines and implements that will

reduce manual labour, do work more efficiently, and enable the farmer to produce better crops at lower costs. Our objectives are (1) to provide the farmer with machines to improve the quality of his work; (2) to make better use of machine power; (3) to enable more efficient use of human labour; and (4) to make machines of greater durability. Our survival as a company depends on it. If we did not plan, engineer, and market products to meet these aims, we would have no right to be in this industry; nor would we be. Only through technical development and improvement has our industry outgrown the blacksmith shop,—and, it started as a blacksmith shop.

Engineering research and development are costly. They require highly trained engineers and scientists, the most modern equipment, and laboratory and field-testing facilities. During 1960, our company spent more than eleven and one half million dollars on this work.

There is no monopoly on ideas. In Massey-Ferguson we are determined to make a heavier impact on the market. We have, and are making, the products to do it. This results from intensification of our emphasis on product planning and development.

Our efforts and expenditures on engineering and research are well-directed. In Massey-Ferguson we have a world-wide engineering division that gives us centralized control, with attendant economies in time, money and talent. This gives us the advantage of a skilled group familiar with the world-wide needs of agriculture, and eliminates costly duplication at the national level.

The design of every machine must result in superior performance and reliability, in safety, in ease of maintenance, in a product capable of volume production, and with customer appeal. All of these characteristics must be achieved at a satisfactory cost—a formidable job in itself. And they are. As stated recently in a technical publication: “Modern tractors last longer and do more work than those made earlier. The average service life of a modern tractor ranges from 16 to 20 years, as compared with about 12 years for those made before 1940”. Our experience at Massey-Ferguson corroborates this statement. The useful life and productivity of our machines has increased sharply.

Massey-Ferguson engineering has paved the way to many innovations during recent years:

- (a) Volume production of the self-propelled combine.

This is a first in the world for this Canadian company.

- (b) The Ferguson system of mounted implements, enabling the use of more powerful, lighter-weight tractors—with resultant fuel savings.
- (c) Variable speed traction drives for combines.
- (d) Sealed bearings to lessen maintenance time and prolong life.

Standardization does have a place, and a very important one, in our company. For many years, Massey-Ferguson has standardized on the design of parts in its machines to the benefit of the customers. Let me mention only a few of many examples:

- A combine sprocket first used in 1921 is still used on combines in North America and France, and is planned for use on future machines.
- Cylinder bars used in 1941-43 were used on a new model in 1953 and are still used in production.
- A very important example too, is that implements designed to fit the Ferguson tractor produced in 1939 have not been obsoleted by newer, larger tractors developed in recent years.

We are now seriously engaged in a study of the possibility of greatly reducing the number of sizes of nuts and bolts used on our machines. This would not only simplify matters for farmers, but would reduce the number of parts we would have to make and correspondingly the numbers our dealers would have to stock.

Within the industry itself, there has been extensive standardization represented in the power take-off, hydraulic remote control, V-belt drives for farm machines, the location of hitches, farm tractor and implement wheel discs, baling wire for automatic balers, and the agricultural tractor test code. This has been achieved by professional engineering societies working in co-operation with the Farm Equipment Institute. We should like to see further progress in standardization approached within such a context.

Engineering and research have given the farmer safer, more comfortable, longer lasting, more efficient and more economical machinery to operate.

Marketing, Distribution, Servicing and Financing Sales.

Our marketing policy and our relationship with dealers and customers are dealt with in considerable detail in appendix III herewith. Because of the vital importance of this phase of our business, I wish to outline briefly the development of Massey-Ferguson's marketing concepts and our approach to distribution, servicing and the financing of sales.

Prior to 1944, "Massey-Harris" in Canada distributed its products through a comprehensive agency organization. Since fewer farmers had automobiles, it was customary to provide sales outlets for whole goods and parts in almost every hamlet. Thus, in 1935, the number of agencies associated with the company was almost 2,300. Many of these agencies held franchises, at the same time, from other farm equipment manufacturers.

These agents, in representing the Massey-Harris company, were little more than consignees. They assumed almost no responsibility beyond transmitting orders from customers to the company. Customers service and settlement of accounts were left to company employees who worked out of 17 branch houses. In addition, there were 10 supporting warehouses which distributed parts. As you can readily understand, this was a very costly distribution organization.

In 1944 the company took a major step forward by changing the consigned contract to a purchase contract. The "Massey" dealer became an independent businessman, responsible for the service required by the farmer-customer. As a result, the forces of competition at the retail level, coupled with improvements in transportation, led to a reduction in the number of outlets—so that in that year we were represented by 1,750 dealers. That was 1944.

From 1944 onward the company has continued to emphasize the basic responsibilities of its dealers to the farmer-customer as well as to the company. This continuing emphasis on the dealer feature of our business—coupled again with improvements in transportation and communications—resulted in a reduction, by 1950, to 1,350 dealers and by 1960 to about 900. In exact terms, we had 549 in western Canada and 337 in eastern Canada. In addition, we serve Canada through five major branch warehouses and five subsidiary locations—strategically situated for the most efficient distribution of machines and parts.

Mr. EMMERT: We mentioned earlier the very high inventory load which the traditional method of distribution in our industry called for, and the graph to which I now refer portrays the relationship of the inventories financed by the company as opposed to the sales. You will note, of course, that as the years have progressed it has taken more inventory to produce a dollar of sale, and this indicates the continuing demand on the part of farmer customers for a more varied line of products than was available to them back in these years.

Mr. HORNER (*Acadia*): Does that inventory graph include parts held by dealers?

Mr. EMMERT: No. It includes raw materials in our factories, whole goods in our branch houses and whole goods in the hands of dealers, goods that they have accepted from us on a purchase contract but for which they are not obliged to pay until the terms of the purchase come to an end, which can, I believe, run off as far as 14 months. The parts in the dealers' hands would be on top of that. It is interesting to note in that respect that our dealers, as a dealer body, actually carry a larger body of inventory parts than we do in our company branches, and our parts inventory last year represented almost a year's sales of parts.

Mr. ALEXANDER: Our policy is to continually "upgrade" the calibre and capability of our dealerships—by working with dealers to attain the highest possible level of *service*, in its broadest sense, to the customer. At the same time, we are providing our dealers with the opportunity of conducting a satisfactory business operation.

The reduced numbers of dealers, with increased service facilities, have in no way reduced competition. In fact, it is more vigorous than ever. Yet we state quite readily that our objective is: more adequately equipped, more financially responsible and more profitable dealerships.

We exercise considerable control over our dealers, particularly in ensuring a high level of service facilities for the benefit of the farmer. As to price, we indicate to dealers our suggested maximum list price on every machine. What the dealer actually gets for any machine is a private matter between him and the customer—because of the high incidence of trade-ins whose value is largely dependent on the market at the time of the transaction.

Based on data available from dealer associations, the net margins of dealers are a matter of public information.

You will understand that in the area of retail pricing we can be of no particular assistance. On the basis of our experience there is no such thing as a static retail price for any of our machinery.

As a sales incentive, we frequently give our dealers special pre-season discounts which, in addition to stimulating sales, help to stabilize employment in our highly seasonal industry.

In any customer-oriented business, the efficiency of the parts supply system plays a major role in determining the quality of customer service we are able to give. With this in mind, Massey-Ferguson established in 1958 basic principles relating to a centralized parts inventory and warehousing distribution system—applicable to any of the company's operations units around the world.

We had three objectives: (1) to improve distribution service to our customers so that a customer order, no matter from where it was placed, could be acted upon immediately and delivery made just as fast as the modern communication and transportation facilities would permit; (2) to bring our distribution costs down in order to improve our profit margin and keep our retail prices competitive; and (3) to put the principles into effect not only in North America, but in other areas of the world where we have manufacturing plants. The two main concepts of our plan, centralized control and global integration, represented two "firsts" in the agricultural industry.

We depend on data processing equipment for handling the mammoth job of "monitoring" distribution activities of the company on a continent-wide scale. Our branches are required to report their disbursements of parts to our central parts office. With the aid of computer equipment we have developed a record, up-dated semi-monthly, which tells us the volume of parts sales throughout North America on an item by item basis and signals us when and where in

our distribution system we are running short on stock. It is interesting to note that in the province of Saskatchewan, our inventory of parts at the end of 1960 was not much lower than our parts sales in the province in that year—and our own parts inventory is estimated to have been smaller than that of our dealers.

Hand-in-hand with parts goes consumer service. We are the only farm equipment company in North America that has a central service centre for training dealer personnel. Over 2,000 practical dealer mechanics have been trained in the past 18 months. Well-trained mechanics save the farmer both time and money, as you know.

Whole goods distribution has been under equally intensive study and action. In 1960, Massey-Ferguson initiated a mixed assembly line at its Detroit tractor plant. This line enables the loading and shipping of mixed carloads directly to dealers, thus reducing freight and handling charges which again permit lower prices to the consumer.

Our implement plants in the Brantford-Woodstock area made considerable headway, in 1960, in loading and shipping mixed carloads of small farm implements—a practice that enables our dealers to stock and service a variety of implements at less cost to the farmer. Many more realistic steps to streamline distribution are planned for the future.

In 1960, Massey-Ferguson established a retail finance subsidiary in Canada. You may ask, “of what benefit to the farmer is this?”

First, many young farmers are limited in becoming good farmers due to insufficient capital. You are well acquainted with F.I.L.A. (Farm Improvement Loan Act) and its fine contribution to the farm economy. By having a secondary source of capital, farmers are able to purchase, through that means, the equipment they require, and use their farm improvement loan to purchase fertilizer and seed which, in turn, help to increase yields.

In addition, a farmer saves time and faces a minimum of “paper work” by having available a one-stop service. He can finance at the same dealership where he purchases his equipment.

Recently, in a move to further streamline the process of communicating distribution data, we introduced a telecommunications system which links all our offices, parts warehouses and plants in North America into a company-controlled network. Together with data processing equipment, we now have fully integrated facilities for collecting the basic data on which to make adjustments quickly to any phase of our distribution activity. As further indication of our activities in this direction, a newly conceived distribution system is now being tested in one area within the United States. When its value to our customers, our dealers and the company has been demonstrated, it can be adapted to Canadian conditions and needs.

Labour Relations

Massey-Ferguson has 9,480 employees in North America—67 per cent of whom are located in Canada. (In exact terms, 6,320 in Canada and 3,160 in the United States.) Like other employers, we have been confronted with rapidly-rising labour costs. Hourly earnings in Canadian manufacturing industry have risen by 111 per cent since 1947—and we, as well as other employers, have had to adjust to that situation.

Almost all hourly rated plant workers are unionized under a multi-plant agreement covering our Toronto, Brantford, and Woodstock factory operations. This agreement is with the united automobile workers. Separate agreements cover stationary engineers, draftmen and plant guards. In all, we are party to 14 collective agreements covering 5,129 employees. Average hourly earnings

in our Toronto plant in December 1960 were \$2.19. This compared with \$2.13 for the Canadian agricultural implements industry, \$1.97 in durable goods manufacturing industries, and with \$2.08 in the transportation equipment group. Other dominion bureau of statistics data show hourly rates in the iron and steel products industry as \$2.09 and in all manufacturing industries as \$1.82.

We feel that the foregoing data indicates that Massey-Ferguson wages compare very favourably with those of the farm machinery industry and with related industries. Average hourly earnings in our Canadian plants increased by \$1.33 or by 153 per cent from 1946 to 1959; this exceeds the corresponding increase in all manufacturing and in durable goods manufacturing industries. Average hourly earnings in our factories have risen twice as much as the consumer price index—yielding a very significant increase in real hourly wages.

Fringe benefits at Massey-Ferguson are generous in comparison with those prevailing generally in Canada. Their cost runs at 28 per cent of our annual payroll or an average of \$1,275 per employee annually. This compares with corresponding averages of 22 per cent and \$1,038 for 100 major Canadian companies.

We have shown that Massey-Ferguson employees' earnings significantly exceed those of the Canadian farm machinery industry, and other industries with which comparisons are relevant. On the other hand, we show in exhibit 'E' to appendix IV that, in 1959 in the United States agricultural equipment industry, hourly earnings were 27 per cent higher than in the Canadian industry.

Lower labour rates in the Canadian farm equipment industry are recognized as the major factor that makes a Canadian-based industry feasible in a common North American market. This advantage overcomes the real disadvantage in transportation costs when selling in the prairie provinces and in the substantial United States market west of Michigan and south of the Ohio river. The Woods-Gordon report to the royal commission on Canada's economic prospects noted this fact. We would not disagree with the conclusion of the Woods-Gordon report (page 37) that Massey-Ferguson "with its substantial manufacturing operations both in Canada and the United States will be in a position to choose the location of any expansion on the strength of the conditions affecting costs and market at that time". We also recognize the fact that United States-based companies have a clear edge in terms of advantageous location in the high-volume North American market. Unfavourable developments in either the transportation rate situation or in our labour rate position could render the present North American deployment of production facilities, uneconomic.

Mr. EMMERY: Once again, Mr. Chairman, I think it would be well at this point to delineate graphically what Mr. Alexander has been talking about. Beginning in 1947, using that as a base, we have charted the cost of rolling mill steel on a wholesale price index, which is the red line on the chart I am holding. We have also charted the farm machinery price index, shown by the broken black line and, in the terms of the orange line, we have charted the average hourly earnings of the iron and steel industry. In this step chart up here, we have charted the increase in freight rates, or the relationship of freight rates to the base in 1947. These three elements, as we stated earlier, are of tremendous importance in the price that the customer eventually pays for farm machinery.

Mr. ALEXANDER: Now, Mr. Chairman, we shall be talking about transportation.

Transportation

Massey-Ferguson makes continuous effort to minimize price increases to farmers both by action within its plants and on distribution costs which apply beyond its factory doors. There is no better example of this than our constant review of transportation costs, in our employing the least costly and most efficient modes of transportation, and in our many appeals (sometimes successful) on freight rates, loading requirements and other transportation regulations. The record submitted to you in connection with this statement bears out the company's vigilance in keeping freight costs to farmers to the lowest possible levels, considering the fact that transportation rates are set by government regulatory bodies.

Canadian plants located in the Toronto area have a distinct disadvantage in freight rates to western Canadian destinations compared to plants located in the Moline (Illinois) and other American areas. The differential in favour of the American plants in shipping to western Canada now runs generally from 60 to 80 cents per hundred-weight over Toronto for 40,000-pound cars. Since the end of the war, Canadian freight rates on farm machinery have increased by 138 per cent, while United States increases have been 113 per cent. For our own organization, any such relationship and disparity would render our ability to sell Canadian products in the great agricultural areas of the midwest United States and western Canada increasingly difficult. Depending as we do on these markets for the bulk of our Canadian output, you can imagine how apprehensive we are, not only for our shareholders but equally for workers in our Canadian plants. At the present time, Canadian plants in the Toronto area enjoy a freight advantage over a territory which includes only 15 per cent of the market of the continent. Our difficulty in maintaining a reasonable share of the United States market for combines is to no small extent attributable to our increasing freight disadvantage.

We bring to the attention of the committee that, in 1952, at our instigation, the railways lowered the minimum carload weights applicable to farm machinery, from 24,000 pounds to 20,000 pounds in some cases, and to 18,000 in others. This brought a substantial saving in freight costs in shipments of combines.

To effect economies in inter-plant movements of components and inbound raw materials, we depend very largely on contact truckers—and secure rates approximately 40 per cent less than those of common carriers.

In 1958, Massey-Ferguson commenced using direct United Kingdom-Toronto ocean freight service on tractors. The opening of the St. Lawrence Seaway made this transport method still more advantageous. The same service has been used to some extent on direct shipments of components from the United Kingdom to Detroit.

Other illustrations of our efforts to effect every possible economy in transportation are: (1) internal and outside auditing of freight accounts to ensure that the most economic rates and routes are used; (2) negotiation of storage-in-transit arrangements to avoid separate freight charge on goods moving out from branches to dealers; (3) encouraging the greatest possible use of direct factory to dealer carload lot shipments, giving the dealer advantage of lower freight charges and of avoiding branch house handling and warehousing costs; (4) prepayment of freight charges to branches and dealers to ensure charging of proper rates and control of routing to give the cheapest and most efficient service; (5) accepting responsibility for loss and damage claims, thus relieving dealers of this task and, at the same time, giving them the benefit of our specialized knowledge and experience in these areas; (6) the use of diversion and storage-in-transit privileges and, (7) the use of loading methods which take advantage of lower rates applicable to heavier loading per car.

Conclusion

At this point, I should perhaps summarize the principal elements of this brief and their significance for your committee.

We have stated that Massey-Ferguson is a Canadian-owned company operating on a world-wide basis. We represent Canada in many lands throughout the world—and in a way that brings credit to our country.

We have presented the record of a substantial Canadian manufacturing organization over the post-war year. Our statement reveals that this company, in its North American operations, exists on its present scale because of free access to the United States market.

We have shown that sharply rising freight rates are placing us in increasing difficulty in our penetration of that market and have suggested that any substantial barriers to movement of our products to the United States market—either by way of freight rate increases or in other ways—would place us in a most difficult position. Only by our large volume of sales in the United States can we keep down costs and introduce imaginative, practical products for the benefit of the Canadian farmer.

We can affirm the finding of the Woods-Gordon report that our company, in its future expansion plans, will have to weigh carefully the advantages of labour cost, in a Canadian-based operation, against the transportation and other advantages of location in the United States.

We have stated that we have an aggressive management and that it is doing a good job on behalf of Canadian agriculture; nonetheless, we have not succeeded in making satisfactory earnings over the past seven years.

Canadian farmers benefit from Massey-Ferguson operations not only in a world-wide market, but particularly in a North American market. Almost two-thirds of the output of our Canadian factories is sold in the United States—permitting economies on a scale that we could not otherwise achieve.

Our North American operations have contributed to the entire Canadian economy. As stated earlier in this presentation, our exports to the United States since 1949 have resulted in a net favourable balance of trade for Canada of \$460 million. A very important consideration is that we serve the Canadian market without tariff protection—and ask for none.

We have indicated that in those areas over which Massey-Ferguson has any power to contain costs, we are aggressively pursuing appropriate policies. We are moving ahead in this direction, in the first instance, on behalf of our shareholders, but in full knowledge that to reap *any* gains for our shareholders and our employees we must provide the farmer with a better machine than he can get from our competitors, and at a competitive price. To solve this problem is the great challenge to our management people engaged in production, in engineering, in marketing, in labour relations and in financial management.

The committee will realize that for some years we have distributed our products in a buyer's market, and we are sure that evidence presented by the farm machinery dealer trade associations will bear this out. On the other hand, as we have pointed out, we lack a very significant degree of bargaining power in respect of the prices we pay for our major production requirements. In this sense, we share the cost-price squeeze with the farmer. Faced with this situation, we have both in manufacturing and marketing, exerted every reasonable effort to realize economies.

Finally, we have stated our concern about the income position of the Canadian farmer, for the very simple reason that our sales and earnings are very sensitive to farm incomes. It will be perfectly clear to you that our prices are not at their present level because of high profits—last year our profits were 2.7 per cent of consolidated world-wide sales.

Leading economists tell us that farm prices are low because of the very slow growth of demand for farm products, and because of the rapid productivity gains by Canadian agriculture—gains to which our farm machinery industry has contributed.

We are painfully aware of the intractable character of the farm income problem, and hope for the success of this committee, and all government and farm organizations endeavouring to find solutions to the problem.

Be assured, gentlemen, of our sympathetic interest and assistance in your efforts to aid Canadian agriculture. We look forward with faith to the development of a stronger farm industry in Canada—an industry which will provide adequate rewards to those who produce Canada's farm output and to those who provide them with the necessary tools.

Thank you very much for your attention.

Mr. EMMERT: Mr. Chairman, I may simply state that what Mr. Alexander has given to you in the way of an oral presentation is, of course, a summary of the mass of detailed information which is contained in the entire brief in the form of appendices.

That concludes our oral and visual presentation. I and my associates from Massey-Ferguson would be very pleased to stand ready to reply to any questions the committee may have.

The CHAIRMAN: Thank you very much, Mr. Emmert and Mr. Alexander. Before we proceed any further I must apologize to Mr. Emmert. I neglected to give him a formal introduction to the committee. I shall do that at this time. Mr. Emmert was born on a farm in the state of Illinois. He received his early education on another farm in the state of Washington. His business career covered the automotive, air craft and agricultural implement industries. He did not come to the good country of Canada until 1947, and became a naturalized Canadian citizen in 1956. Since coming to Canada, Mr. Emmert has lived and worked in Montreal, Windsor and Toronto. During the course of his work he has had the opportunity to travel across Canada many times from coast to coast and has acquired a good knowledge of Canadian agriculture in all the provinces.

I would ask the committee to direct questions through the chair to Mr. Emmert, who in turn may wish to ask a member of his organization to reply.

Mr. MUIR (*Lisgar*): On page 15 of the brief the effort they have made towards standardization of parts is mentioned. Would you not agree there is still an extensive area for improvement and expansion in this particular field of lowering costs.

Mr. EMMERT: Mr. Chairman, if I may reply to Mr. Muir's comment, we would quite agree there is a great deal of work to be done yet in the way of standardization. As a matter of fact within the last two years we have appointed within our worldwide centralized engineering division an activity which devotes its time to the matter of standardization of parts within our own company. In addition to that there is a lot of effort being put forward by the farm equipment institute—that is all the farm implement manufacturers—in an attempt to standardize items which lend themselves to standardization as between manufacturers. Nuts and bolts are an obvious example of that kind of thing.

We do not want to leave with you the impression that a great deal of effort has not already been made in this regard. It is possible today for a farmer customer to buy a Massey-Ferguson tractor and, if it suits him, to buy all of the equipment which might be attached to that tractor from other manufacturers. It certainly is not the intent of the manufacturers to so design their products that a customer, once having bought a piece of motive power, is

forever and a day hooked to that particular manufacturer. From a market point of view this would be very desirable; but on the other hand, it would backfire in terms of the used market for equipment.

Mr. MUIR (*Lisgar*): I have a supplementary question. I think one of the areas in this field which is rather annoying to perhaps some of your farmer customers is the fact that so many of your parts are not interchangeable between machines. I am talking about the sickles for your twelve foot combine which might be used on a twelve foot swather. The reel, slats, arms and so on, are the same; quite often there is only a fraction of a difference, but enough difference that they cannot be used on the different machines.

Mr. EMMERT: We discussed this last night at the hotel. In this instance, I think I would like Mr. Forsyth to expand on the answer I might give. Mr. Forsyth has a considerable knowledge of this industry and what may appear to our customers to be minute variations.

Mr. FORSYTH: In answer to your question, I will attempt to draw an example. In recent years in certain areas of North America a swather, for example, has become a normal method of handling hay. A peculiarity of a machine in cutting dry grain such as cereal crops is that the cutter bar requires a serrated blade in one case and a smooth knife section and reverse on the other. Although there is no basic change in the cutting bars there have been major changes necessitated such as a different angle of guard and different point of attachment. Many of the old machines are still in operation for which we have to supply parts. Therefore what would appear to the individual customer to be a confusion of these guards on sickles exists.

Mr. MUIR (*Lisgar*): Otherwise you mean that in your newer machines you are more or less trying to standardize that sort of thing.

Mr. FORSYTH: As much as is possible. If my memory serves me correctly we use only three types of guards in all our swather, mower and combine table production today.

Mr. EMMERT: If I may amplify that, we were speaking of standardization a moment ago. One of the major products that this standardization unit within our company has been assigned is to eliminate to the greatest degree practicable the multitude of different knife sections which our company manufactures all around the world. This is done really for very selfish reasons, because the fewer number we have to manufacture the more concentrated manufacture we can obtain. For example, we have a capacity in our Woodstock factory, where we make knife sections for North America, of about twelve million sections per year. It has been many many years since we have run anywhere near that capacity. Obviously, if we could we would benefit through lower production costs, and our customers would benefit. However, I must point out that if you standardized completely on an item of sufficient importance as is a knife section you would only serve to compromise the utility of the machine on which the section is used. It is quite true that a given knife section would cut dry hay, wet hay, oats or wheat, but it probably would not do it with the greatest efficiency.

We know in the case of some of our customers that they do not choose, for reasons of their own, to use the sections that we recommend for a particular application, because they just happen to run their machines the way they think would be most effective and most efficient. Some men like to travel at high speed, while other men like to travel at slower speeds.

Mr. HORNER (*Acadia*): I have a question on another line, and one which is supplementary to Mr. Muir's question. Mr. Forsyth has said that they are now trying to standardize their guard set-up. They put out a mower which has three different sets of guards. This creates great complexity to the dealers

all over western Canada. They have put out a mower for which they have put out three different cutting guards. Surely this company could go a long way to standardize that practice.

Mr. FORSYTH: Which one was that?

Mr. HORNER (*Acadia*): I am referring to your Dyna-balance mower. One of the cutting bars was made in Detroit, while another was made in England.

Mr. EMMERT: I can assure you that there must be some mistake, because none of our cutting bars come from the United States.

Mr. HORNER (*Acadia*): Well, I think they came from over there, at least, one or the other did.

Mr. FORSYTH: You are referring to the three-point mower?

Mr. HORNER (*Acadia*): Yes.

Mr. FORSYTH: It is conceivable that if that mower was produced previous to 1954, or even in 1954, there may have been difference sources of bars, but I do not think any came from England up to that time.

Mr. HORNER (*Acadia*): It was in 1956 when I bought it. It is a good mower, but it has created a great deal of headaches to the dealers. The dealer I have been dealing with has one complete grade of knife. They have tried to simplify it a little, but there is still a great deal of room left for further standardization in that regard.

Mr. FORSYTH: In that respect, that particular mower was first designed for forestry work, and not for agricultural use at all. Previous to our purchasing the company we would agree that there were actually five different sets of guards used on it—I think it is five. Some of them were used for a crop of which I cannot recall the name quickly. Oh yes, it was Medina clover, which required a special guard.

Mr. HORNER (*Acadia*): And for that same mower they put out two different knives, yet the holes for the knife sections are one-eighth of an inch apart. A farmer would go in and buy a section, only to find that it did not fit his particular sickle, because the holes were one-eighth of an inch out.

You would think it was for a John Deere machine. There should be standard practice not to vary the holes for the same knife in the same mower.

Mr. PETERS: I have a supplementary question: what relationship for standardization of this equipment do you have with regard to the metric system as compared to our American system? What overall standardization has taken place throughout this industry because of the co-operation to reduce the standards of measurement?

Mr. EMMERT: In reply to Mr. Peters, there was a substantial amount of work being done. And in our own industry in respect to the problem of changing the metric system measurements without our own company, we have no recourse but to handle through our central engineering division. If a part is designed in France, and it has application in Great Britain or in North America, we simply have to transpose from the metric to the inch measurements. From a manufacturing point of view, particularly in the case of a company such as ours which operates all around the world, it would be most desirable to have everything on the metric system. But unfortunately, we as individual manufacturers are not in a position to do that.

Our sales of course, in those countries which are not on a metric system, would suffer drastically if we attempted to introduce it.

The CHAIRMAN: It is now getting near the adjournment time. There will be another meeting in this same room at 2:30. I would like to ask the members to occupy their same seats this afternoon that they now occupy because it would

help our reporting staff. And I would ask those who wish to direct questions in the French language to sit as near as possible to the front, because this would help the translator in translating their questions.

Now, Mr. Horner.

Mr. HORNER (*Acadia*): I have a question on another subject. On page nine of your brief you suggest that Massey-Ferguson prices its products to Canadian dealers at prices no higher than those accorded our American dealers. In other words, you suggest that the Canadian farmer and the American farmer is on the same basis, price-wise.

How does this compare with prices in Great Britain? I am thinking of the Massey-Ferguson 35 which is made and sold in Great Britain, and also sold here in Canada and the United States. Are the prices the same?

Mr. EMMERT: In reply to Mr. Peters and to Mr. Horner, the Massey-Ferguson 35 tractor is made in two versions; one version is made in Great Britain, and another version is assembled in Detroit from components made in Great Britain. For internal reasons we have chosen—and also it is good for the economy of this country—to import our requirements for Canada of the Massey-Ferguson 35 tractors, from Great Britain. This is not the same tractor that we sell in the United States. It has the same engine and transmission, but it is a different pattern, and has certain different, minor features.

Now, as to what the tractors are sold for in Great Britain at the dealer level. I am sorry that I am not in possession of that information.

Mr. HORNER (*Acadia*): I might have asked my question in a poor way: but what are they sold for by the company? Are they sold for the same as they are on this continent?

Mr. EMMERT: As I have said, I am not in possession of the information on what the company charges the British dealer, because they have an entirely different method of distribution in Great Britain than we employ in North America. Secondly, by far the majority of tractors produced in our Great Britain factory are exported and not sold in the home market. I am sorry that I cannot give you the figures.

Mr. KORCHINSKI: Could it then be said that there is a different price for each country outside of the North American market?

Mr. EMMERT: I think it would be true to say that if you were to select any article that you might want to select, I am afraid you would find a different price in almost any country.

We consider that our policy of selling to the Canadian farmer at prices—or rather to the Canadian dealer—at prices no higher than to the American dealer is a very progressive policy. But as to dealers in France, Great Britain, Algeria, Brazil, or India, what they may pay really has no bearing on market conditions within North America.

Mr. KORCHINSKI: But your over-all operation has a bearing on the sales in other countries. The overall net profit of the company has a direct relationship to the sales in those countries, and the prices you receive from those dealers.

Mr. EMMERT: I think I could assure you that the prices our company charges to dealers in the other 140 countries of the world where we do business, are set by much the same sort of policy and principle we have enunciated here. The market sets the price. Our costs are secondary. This I know, from personal experience. The dealer in India would pay a substantially

higher price for a tractor than would a dealer in Canada. I know that. What the Great Britain dealer pays, I do not know. But I know this: that he pays for a Massey-Ferguson product what that product is worth in the Great Britain market as compared to its competition.

Mr. KORCHINSKI: Is it because of transportation costs added on to it or is it different policy, a different rate that you set for those countries?

Mr. EMMERT: No, the policy as I attempted to enunciate, is identical, but we are hemmed in by the requirements of the market, by competition, and by stock pricing policies. There is no question about that. And it applies to other private enterprise business as well.

Mr. SMALLWOOD: Have you any comparison with the price to you of producing the Massey-Ferguson 35 tractor in Canada as compared to producing it in Great Britain?

Mr. EMMERT: We do not produce tractors in Canada. The comparison would be as between production in the United States and production in Great Britain. Because of the very high incidence of components from Great Britain that go into the tractor assembled in Detroit, the basis of costs would be very nearly the same. From a purely selfish point of view we would be better advised to import tractors from the United States—that is to say, this would enhance the manufacturing volume of our particular operating unit in North America; but for considerations that I have mentioned, we have chosen to import our “35” requirements for Canada from Great Britain.

Mr. HORNER (*Acadia*): Why is there a different price for the tractor which comes directly from Great Britain than there is for the tractor which comes directly from Detroit? I am thinking of the position in western Canada of a dealer who received a tractor directly from Great Britain. It had a different price, plus the freight to the dealer than did the one coming from Detroit.

Mr. EMMERT: I am not aware that identical tractors were shipped to dealers in western Canada from both sources.

Mr. HORNER (*Acadia*): I think that has happened.

Mr. EMMERT: If it has happened it would be a very unusual circumstance. Here is our line of tractors. These are the tractors which Massey-Ferguson sells in North America.

We happen to be talking about a model 35 which was produced in Great Britain as well as in Detroit. They are also going into production in Brazil, and in India, with an equivalent model; and it will also be produced in France. But they all have some variation. Model 50 is a variation of model 35, and it is produced only in North America and it has a somewhat different application in the field. Number 65 was originally designed primarily for the North American market, but it is now earning some favour in Europe and Great Britain. Your domestic production for this tractor is in Great Britain, but the whole North American requirement comes out of the Detroit plant.

Mr. FORSYTH: The number 65 was originally designed primarily for the North American market. It is now gaining some favour in Europe and Great Britain and they are beginning production of this tractor in Great Britain. However, all our North American requirements come out of the Detroit plant. It is only in the case of this small tractor that we use imports from Great Britain to Canada.

The CHAIRMAN: Gentlemen, we will adjourn now until 2.30 this afternoon. Thank you.

AFTERNOON SITTING

MONDAY,
May 1, 1961

The CHAIRMAN: Gentlemen, the question arose during this morning's proceedings as to the printing of some of these charts that were displayed here this morning. In order to print them as appendices I believe a motion from the committee is in order, requiring a mover and a seconder.

Mr. KORCHINSKI: I so move.

Mr. SOUTHAM: I second the motion.

The CHAIRMAN: You have heard it moved and seconded. Is there any discussion? It will take quite a number of days to print the proceedings for today, so you may not have your copies of them for some time. Is the committee agreed to the motion?

Motion agreed to.

Before lunch time I believe Mr. Korchinski was asking some questions.

Mr. HORNER (*Acadia*): Mr. Chairman, in order to make the committee proceedings much easier to read and understand, I think it would be wise for the chairman to regulate the questions so that they deal with certain aspects of the brief first, and then go on to other aspects. That will make our questioning in the committee proceedings have a certain amount of continuity.

The brief is broken down into six parts, and even section A is broken down into six parts. Perhaps we could deal with those sections, and thereby arrive at a better conclusion.

The CHAIRMAN: Are there any other comments on how we should proceed?

Mr. CLANCY: I would like to second the suggestion that has been made. We have already covered the general section A, and I suggest that the committee's questioning be confined to the various appendices as they arise. Let us start with appendix B, and then carry on with C, D, E, and F.

The CHAIRMAN: I understood it was the wish of the committee that we review part A, the general statement, and certain aspects that have arisen therefrom.

Mr. CLANCY: That was not my suggestion. We have already covered section A. Now we are going to move on to the various appendices, and I suggest the committee confine its questions first to Appendix B.

Mr. KORCHINSKI: My question has reference to a question asked earlier. How am I going to go to section B from there on?

Mr. HORNER (*Acadia*): Your question follows under section B "sales, prices, financial aspects and profits".

Mr. KORCHINSKI: I think we ought to leave it to the chairman to decide.

The CHAIRMAN: I think we should devote a little more time to section A, and then go on to section B.

Mr. HORNER (*Acadia*): Section A is a summary of the rest of the brief.

Mr. CLANCY: The details are to be found in the appendices.

The CHAIRMAN: Mr. Korchinski will continue now, because he had the floor before the luncheon adjournment.

Mr. KORCHINSKI: My question relates to a reply that was given by Mr. Emmert, who suggested, after I inquired, that he did not know what the return or what price the dealer would have to pay to the company, if he were in Britain. He also suggested that he knew it was higher in India.

Before we started in with this committee some time last fall, I wrote to the company and inquired or asked for a comparison of the different items, such as tractors, harvesters, combines, bailers, and so on, in the different countries of the world.

I thought I would like to see a comparison. I have not received a reply and I wondered if there was any objection to having this type of information supplied to the committee, and if so I would like to know why.

Mr. EMMERT: Mr. Chairman, with your permission, our group would like to stand when they reply, so that people, perhaps, at the back of the room, might actually see who is talking.

Mr. KORCHINSKI is quite right. I replied, as he indicated, earlier this morning. The plain fact is that I cannot tell you what the Great Britain dealer would pay for a model 35 tractor.

Mr. KORCHINSKI: I do not want to know the exact price, but I would like to know if there is a difference? Is the price higher or lower to the Canadian dealer as compared to the United Kingdom dealer?

Mr. EMMERT: The only thing I would be sure of is there is a difference, because it is in a different market.

Mr. KORCHINSKI: Which way would it be, up or down?

Mr. EMMERT: I do not know.

Mr. HORNER (*Acadia*): Perhaps the comptroller or some of the other officials here might know.

Mr. EMMERT: I wonder if Mr. Penney has any knowledge of this?

Mr. N. H. PENNY (*Comptroller*): No. Our responsibility is within the North American group. I am afraid I do not have the other figures. I certainly do not have them here.

Mr. KORCHINSKI: Would you have any objection to supplying them to the committee at a later date, when you get that information?

Mr. EMMERT: Did you address a letter to our company?

Mr. KORCHINSKI: Yes, I did.

Mr. EMMERT: May I have a copy of it before I leave today, and we will reply to it in appropriate terms?

Mr. KORCHINSKI: Very well. If we could have that information supplied for the committee, it would do just as well.

Mr. EMMERT: We will do it as promptly as we can. I do not know if we have all the price lists in Toronto.

Mr. HORNER (*Acadia*): According to the 1937 inquiry, at that time the company stated that they had one price which they applied the world over, taking into adjustment any freight and so on. I think we should have it established as to whether there is a different price for every continent, and if so, the fact should be established.

The CHAIRMAN: Mr. Emmert has said that he would endeavour to provide that information as soon as possible.

Have you a question, Mr. Korchinski?

Mr. KORCHINSKI: No, Mr. Chairman; I have no further questions at this time, just as long as he can get that information for us.

Mr. HORNER (*Jasper-Edson*): Mr. Chairman, I have a supplementary question in connection with overseas pricing.

The CHAIRMAN: Proceed.

Mr. HORNER (*Jasper-Edson*): Did I understand Mr. Emmert to say that the company would charge, then, what the market would stand? This is what he said this morning. He said it would depend on the market.

Mr. EMMERT: Mr. Chairman, I am sorry, but I did not get the member's name.

Mr. HORNER (*Jasper-Edson*): Horner.

Mr. EMMERT: There are two of them.

The CHAIRMAN: No, there are three.

Mr. EMMERT: Mr. Chairman, I do not think that we quite said that we would charge what the market would stand, but that our pricing was guided by the demand and the market. I suggest there is a substantial difference between what we said and what you just said to us.

Mr. HORNER (*Jasper-Edson*): I have some friends who went to Scotland last year. They told me they could have bought an M.35 tractor over there cheaper than at home, and saved themselves between \$300 and \$400. In buying it from a dealer over there, taking into account the freight rates and everything else, they could have had it shipped home, with a savings to themselves of \$300 to \$400. If such is the case, I suggest to you that there would be an opportunity for an independent machine agent in Canada to go over to England and buy these tractors and have them shipped into Canada, because there is no duty. We have free trade.

Mr. EMMERT: Mr. Chairman, let me recite an incident which has had our general sales manager, Mr. Forsyth, fairly well wrought up in recent months. In fact, an individual is attempting to do that on the west coast.

Mr. HORNER (*Acadia*): Good.

Mr. EMMERT: Actually, I think, this entrepreneur was in the state of Washington, but he was attempting to sell these tractors in the province of British Columbia. For the past several months, I have not seen any more indication of worry on the part of Mr. Forsyth. I asked Mr. Forsyth on the way down what had happened to this worrisome thing out west. Apparently the man found it was an uneconomical proposition. At any rate, he no longer is importing tractors for re-sale.

However, there is absolutely nothing to prevent any entrepreneur from buying any tractors anywhere in the free world and importing them. All of you in this room know that there are a great many importations being made into Canada and all of us who are intimately concerned with the industry know that many of the importers are in business for a very short time.

The CHAIRMAN: Have you a question, Mr. Gundlock?

Mr. GUNDLOCK: In all deference, does the same thing apply to the dealer in Washington as it would to a dealer in British Columbia? Does the United States add some duty to British products which, perhaps, Canada would not?

Mr. EMMERT: I cannot answer that question. Have we any knowledge of the tariff in the United States in connection with British products?

Mr. ALEXANDER: It is preferential to Canada.

Mr. EMMERT: I think the answer would be that there is no tariff on agricultural products from Britain to the United States.

Mr. GUNDLOCK: In connection with agricultural machinery?

Mr. EMMERT: I know that is the case, at least in respect of components which we import from our Great Britain factories to Detroit.

Mr. HORNER (*Acadia*): In other words, what you are saying is that the price in Great Britain bears a direct relationship to the price on the North American continent, because, if it were not profitable, this fellow would start up again in British Columbia.

Mr. EMMERT: I do not mean to imply that we price in North America with the British price list in front of us. By no means do we do that.

Mr. HORNER (*Acadia*): Could you give the committee some idea as to how you arrive at the prices on the North American continent?

Mr. EMMERT: Yes. That is not an involved situation.

First of all, we attempt to ascertain what competitive products are being sold for. We then attempt to ascertain whether a competitive price on our part would allow us to cover all of our costs of doing business. If they do, so much to the good. However, if that competitive price does not, then we feel we have to take steps to adjust our cost within that competitive structure.

The CHAIRMAN: Have you a question, Mr. Korchinski?

Mr. KORCHINSKI: I have a supplementary question. For example, you did have a product which no other competition was offering—and I am thinking of the original self-propelled combine. You had a market for that particular type of product. In that case, you had no other comparison to make. In a case like this what would be your guiding factor?

Mr. EMMERT: I cannot answer what is really a hypothetical question, because that situation does not exist.

Mr. KORCHINSKY: But it did exist in the past.

Mr. EMMERT: Yes, perhaps you are right to a degree. However, I do not know what the pricing policy was, then.

Mr. CLANCY: Massey-Ferguson is an integrated company with world-wide responsibilities. Do you sincerely believe that, by bringing the British components and the British tractor in from Great Britain, you are selling to the Canadian farmer a product cheaper than if it was brought in from your tractor set-up in the United States? It has been pointed out this morning that in a free trading market in North America the competitive position is based on wages, freight rates, and transportation. I am not interested in your accounting system. I know that taxes vary in different countries. However, by bringing in your Massey-Ferguson 55 from Great Britain, does that actually mean you are able to provide competition in the Canadian market at a better price than if you brought it in from the United States? Aside from the fact that it is a free trade area, we know we have sales tax and various other things. The third question is: is this leeway given Massey-Ferguson used as dealer incentive, or is it passed on?

Mr. EMMERT: With three questions before us, I think we should start with number one. Would you restate it?

Mr. CLANCY: Does the company, as an integrated world-wide company, believe that by bringing in the 55 tractor from Great Britain, and by bringing your components into the United States, it is assured of a competitive position? In other words, if you had to manufacture entirely on the North American continent would you be out of a competitive position for the quality of goods you are supplying?

Mr. EMMERT: To begin with, I would like to be sure we understand each other in respect of terminology. The only tractor we import from Great Britain on wheels is the model 35.

Mr. CLANCY: I am sorry.

Mr. EMMERT: We assemble that same tractor in Detroit largely from components which we bring from England. We are certain that as an integrated world-wide company it is to the customers, the dealers and our own benefit to use that method of production; for example, to centralize in one area to the greatest degree possible. First of all, we have the well known advantage of volume of production. Secondly, we can afford more sophisticated tooling and so have better quality. Thirdly, we carry less inventory by doing it in that way. These are economic advantages which, if they did not accrue to us, would cause us to be less competitive in the Canadian market.

Mr. CLANCY: In other words, as an integrated company you believe your competitive position in that particular model is based on the fact that you are producing it in Great Britain and importing it here, and this is a two-way trade; they buy our wheat and we buy their machinery.

Mr. EMMERT: You do not have to go into another product such as wheat. In our Toronto works, for example, we produce all the cranks used in the combine everywhere. This is because we have a very sophisticated tooling situation in Toronto and could not possibly afford to duplicate it elsewhere. We could not afford the impact of the costs of doing cranks another way elsewhere, and we get better cranks doing it this way. Our world-wide combine engineering is centralized in Toronto. This flows both ways. Only this year we produced 120 large dieselized combines in our Toronto works for sale in the United Kingdom and France. That is an advantage of being an integrated company. The marketing people in the United Kingdom and in France do not know whether or not this particular combine will strike the fancy of the buyers, so it made very good sense to produce them in Canada in this instance and ship them over there. If it becomes really a satisfactory item, and there is a great market for it, I have no doubt that in later years they will produce them in England and perhaps in France.

Mr. CLANCY: In your brief you have already put forward the fact that your combine production was based in Canada and you were using the large North American free market because we had a certain advantage in hourly rates; maybe we were a little bit out on transportation and in order to compete in this market you had to have this differential. We will not go into the details of freight or anything else, but the fact is you can assemble this tractor using British components and in your opinion make a saving which eventually is being passed on to the consumer.

Mr. EMMERT: As I recall it you asked directly whether or not such saving, if any, would accrue to the benefit of the dealer or to the customer.

Mr. CLANCY: No. I will rephrase that. What I am asking is: is the saving used for promotional work, or is it based on and used as a direct saving to the consumer?

Mr. EMMERT: We would prefer, of course, the latter, because then we would attract more customers through a more advantageous pricing. That, of course, is our very objective. I might also point out that without such savings as we are able to engender through being an integrated company we would be less competitive and our competitors would enjoy more of the market. Whether we like it or not we are not number one in volume around the world.

Mr. HORNER (*Acadia*): What percent of the Canadian market do you envisage your company has?

Mr. EMMERT: We do not have accurate figures to determine that. We are really bound to the D.B.S. figures, and you find mixtures in them. We like

to feel that in the Canadian market we are number one, but perhaps another of our competitors would like to argue about that. I suggest it is just about that close.

Mr. HORNER (*Acadia*): You would not have a guess as to the percentage?

Mr. EMMERT: No. I would not be prepared to do that, because of the invalidity of the figures available to us as compared to what we actually sell.

Mr. McINTOSH: I think my question is supplemental to what Mr. Clancy asked. However, I would like to preface it with this. Our terms of reference are to inquire into the price of farm machinery, I suppose with a view to determining the reason for the apparent high cost to the purchaser. I am very interested in your statements in part A of your brief, although it could be taken under part B. The first statement starts at the bottom of page 4:

...in recent years, the prices we have charged for our products have not covered costs and provided a fair capital return.

The second statement in which I am interested is about a quarter of the way down the page:

Our biggest cost elements are steel, labour and transportation; and over none of these have we any significant control.

I believe in one of the questions asked, one of the reasons for manufacturing in another country was mentioned as being the contribution it may make to lower costs of the products, in that you have a larger volume and have less inventory to handle. A previous witness whom we had before us, when the question was asked of him what do you contribute the high cost of machinery to, said there were three factors. He outlined them very much as you have, but he said the cost of material, the cost of transportation and the cost of labour. I am wondering if you are able to obtain steel in say one of these foreign countries cheaper than in Canada; also if you are able to obtain labour in one of these foreign countries cheaper than in Canada and the same with transportation. In view of the tariff easements, as you may wish to call them, on imports of farm machinery in Canada which you manufacture in foreign countries, will that make the cost of the finished machine cheaper to the Canadian purchaser?

Mr. EMMERT: I am not sure I understand the question. Could you be a bit more explicit, please?

Mr. McINTOSH: First of all, are there any other factors which affect the profit you say you are not getting besides the cost of material, the cost of labour and the cost of transportation, that we should deal with in this committee in order to find out the reason for the high cost of machinery to the purchaser. That is one question.

Mr. EMMERT: I would have to reply, of course, in the context, that from our point of view, as we have attempted to explain here, we do not consider the cost of machinery to be high; period.

Mr. McINTOSH: The purchaser does, otherwise this committee would not be sitting.

Mr. EMMERT: It has risen, that is true. I think there is a very grave danger that if these elements of cost which you have enumerated are not controlled we will find this country without industry in the agricultural equipment field. We have said that aside from the lower labour rates that the Canadian industry enjoys we would be better off to be located in United States because of the transportation hazard which we face, operating as we do. There is nothing at all in the current laws to prevent any invader from invading this market—at what price I have no idea. They might bring it in. I can tell you with certainty that labour is cheaper in Japan, for example. Material possibly is cheaper also.

You must weigh that against the additional transportation distance they have to cover. We are no different from other Canadian industries in the sense that we face a very grave danger if these costs remain out of control. There is one other element of cost that anyone attempting to compete with our established companies would have to become very aware of; that is the initial capital cost to provide the basic facilities that Massey-Harris and Massey-Ferguson have provided over the last century, and that our good competitors have provided over almost the same period of time. People will look at the evidence before they put up the amount of capital money required, and if they look at the returns of the companies already established they will see how low they are.

Mr. McINTOSH: I think you have answered my second question indirectly. However, I would like to put it again just for the record. Can you obtain materials in other countries cheaper than in Canada? Can you obtain labour in other countries cheaper than you can here? Is transportation cheaper in other countries?

Mr. EMMERT: We will answer that one by one. Certainly it is possible to obtain labour cheaper in other countries. It is possible to obtain steel cheaper in other countries; that is the principal material. So far as transportation is concerned, it makes no difference whether you can haul a combine for a mile in Great Britain for less than in Canada, because it must be hauled in Canada to get to market.

I cannot answer your question significantly.

Mr. NASSERDEN: What percentage of the total price of a machine does labour, steel and transportation constitute?

Mr. EMMERT: This is a very difficult thing to answer. As a matter of fact it cannot be answered as a generality.

Mr. NASSERDEN: I am aware of that. The reason I asked this question was I was wondering about advertising costs. Is it one of the great costs of doing business today?

Mr. EMMERT: The cost of advertising in our view is a relatively modest cost in relation to the benefits that it brings. We are no more anxious to spend money uselessly on that media than we are on any other.

Mr. KORCHINSKI: Mr. Chairman, may I ask a supplementary question to what Mr. Nasserden asked here? I think it will be relevant to the conclusions we reach in this committee if we could possibly get a breakdown from your company indicating what is the percentage of cost, say, of steel, transportation or labour, which have gone into your over-all operation over the past ten years? I know there will be others who will be presenting perhaps a different point of view. For example, I might suggest that labour might say that it does not contribute as much towards the over-all cost of the machine. You might have a different point of view, and I wonder whether, for relevancy, you could not supply us with that type of information.

Mr. EMMERT: I will have to reply that that is a practical impossibility to do as you have suggested. I will tell you why. Nothing is static in this business of building farm equipment. For example, today we may build in our own factory stamping A. We may find it advantageous for a number of reasons in the forthcoming production year to buy it outside. We may choose to buy it in Canada or the United States or have it furnished to us from one of our associated companies in Europe. There is a continual interplay of production, particularly in our company, which is an integrated world-wide operation. It would therefore be a practical impossibility to tell you, with any accuracy, what the relative percentage of labour, material or any other item of cost you might want to mention, have borne to the total sales dollar in the last ten years.

Mr. KORCHINSKI: In other words, what you are suggesting is that you have no idea what labour is really costing you.

Mr. EMMERT: I am afraid that is a little far-fetched.

Mr. KORCHINSKI: If you cannot compare it within a few percentages—

Mr. EMMERT: No, in replying to your original question, which I think I understood, I thought I provided you with a reasonably cogent answer. Do you have another question?

Mr. KORCHINSKI: If, for example, in 1950 your total labour cost was, say, 35 per cent of over-all expenditure, and your steel cost you 40 or 50 per cent, and the balance was your other expenditure, this is the type of thing we want, because I think it is relevant to what conclusions we come to. We want to know how it has actually been brought about. For example, as I said, labour might have been 35 per cent in that year and because of the increases it may have gone up to 50 per cent. You may also have had a reduction in staff, which may have brought it down to 20 per cent. These are things which I would like to have answered for my information.

Mr. EMMERT: I can appreciate why you would want them, but I must repeat that it is a practical impossibility.

Mr. McINTOSH: If you cannot do it, no one can.

Mr. HORNER (*Acadia*): In the annual report the company states the marketing expenses and the general administrative expenses. I cannot see why it would be impossible for them to state their total payroll costs. This does not seem to me impossible. If they can state their marketing expenses of \$46 million, surely they should be able to state their total payroll costs.

Mr. EMMERT: That was not the question.

Mr. HORNER (*Acadia*): Can you give us your total payroll costs from 1950 to 1960, and the number of persons employed?

Mr. EMMERT: Related to what?

Mr. McINTOSH: To the amount of goods produced.

Mr. HORNER (*Acadia*): It does not have to be related to anything.

Mr. EMMERT: We produce a different kind of goods each year. If we had a constant production your question would be valid. You can then ascertain what you want to know, what percentage of the sales dollar goes to labour. But we are not selling apples all the time—we continue to mix them up.

Mr. HORNER (*Acadia*): The only thing we can get is a general appraisal, but if we had the number of persons employed in 1950 and the total payroll cost of employing them, it would not matter whether in 1950 they were making mostly combines and in 1951 tractors—it would average out. This is all we can assume. We would then arrive at the cost.

Mr. EMMERT: Those are exactly the kind of assumptions we would not want to be associated with, because there are too many variables.

Mr. HORNER (*Acadia*): In the 1937 report Massey-Harris Company tabled the exact cost of labour, management, factory burden, and so on, in the breakdown of several factories.

Mr. EMMERT: This was Massey-Harris Company.

Mr. HORNER (*Acadia*): I realize that, but all machinery companies did the same thing, and I cannot see why it would be impossible to do it now.

Mr. EMMERT: This is quite a different set of circumstances a quarter of a century after the report was written. We are a different company.

Mr. HORNER (*Acadia*): I realize that. I still feel that if you can table your marketing expenses for the year, \$46 million, you should be able to arrive at your payroll costs for various years.

Mr. EMMERT: There is no question in the same context as the annual report, that a world-wide figure could be derived for labour costs, but I assure you it is absolutely meaningless. There are so many variables in the thing. Our mix of production, our decisions, all those are forced upon us. Mr. Chairman, with your permission, I would like Mr. Denton, director of personnel, industrial relations, to expand a bit on these variables that makes these comparisons we are talking about year to year meaningless.

Mr. RAPP: How do you arrive at the price of the finished product, if you have no knowledge of your labour and material? How do you arrive at a set price of the finished product?

Mr. EMMERT: Mr. Rapp, I did not say that we did not know what the cost of labour was, and the material, on any given article under an assumed set of circumstances. We, as practically all other major manufacturers, arrive at a standard cost. The first thing we have to do is to arrive at how many units we hope to sell. If we happen to be fortunate and sell that many, then our standard costs, if all of our other estimating has been right, come out somewhere near right. If we are unfortunate, they do not.

Mr. RAPP: This would not help the committee to come to a conclusion as to whether the prices of machinery and farm implements are higher this year than they were last year if we cannot get these factors that contribute to the price and can compare it from year to year.

Mr. PETERS: Mr. Chairman, would Mr. Emmert be willing to supply this for a given number of machines? An investigation in the United States used one particular binder a number of years ago. They have used tractors and they break it down to the management section of labour and labour costs, steel costs, production line costs and the average factors that go into the making of the tractor, so the committee could arrive at what the transportation cost per unit were, the labour costs in relation to such transportation on a given unit and what the management cost was, what the advertising cost of a tractor was, and so on. Unless we come to some conclusion on a specific point—I might be in agreement with you in relation to the over-all policy of the company but I am not in agreement that your company is not large enough that they operate by a cost accounting system which will give you those figures on a tractor, because in making a modification you would have to have cost accounting of that particular unit to arrive at the modification of any change you make in it. This would affect, as you said, your sales. It would have great effect on whether you upped the price or lowered it. You do not wait until the end of the year to find out if the company made a profit. You must have a cost accounting on each piece of machinery. Would it be unreasonable to ask for three or four varied pieces of machinery that would be fairly representative in the committee's mind to Canadian agriculture, or that you could work out this cost accounting on, I would presume, a combine. A great deal of interest in this 35 Massey-Harris tractor was shown and we could probably apply something else for the small farmers that would give an indication of this cost accounting side.

Mr. EMMERT: Mr. Peters, I certainly did not intend to imply that we do not have a cost accounting function. We do. Any manufacturing concern of consequence has. What I am saying however, is that any breakdown of assumed costs on any given machine is suspect, and it cannot be otherwise. It is a completely arbitrary art or science, if you will, generated by people of Mr. Penney's and Mr. Kingsmill's profession. It is not exact; we make an arbitrary assessment of capital cost of our facilities to a given line of machines. You may say to me that that is wrong; all I can say to you is that is the way we do it and our auditors accept it on that basis. I cannot see that this line of questioning, Mr. Chairman, can be meaningful. Our system

of tabulating costs, which is really what it amounts to, is probably somewhat different from our major competitor's system. With what are you going to compare it? Let me repeat once more that if we built apples all the time, and the same apples, then these costs become relative and meaningful—but we keep changing them. We do not build the same thing all the time.

Mr. PETERS: You change the price too.

Mr. EMMERT: Sometimes up and sometimes down.

Mr. KORCHINSKI: I would refer you then to IX in B. Here in 1958 you have an amount for recovery from dealers, \$2,053 for the F.E. 35 tractor; in 1959 the recovery is \$1,908. Obviously there was some governing factor which has brought that price down. You must have been able to tabulate the cost of production of that particular line of tractor. You must have an accounting of some sort. If I may refer to your tables presented earlier this morning, we have an indication there. This is all relative, but it does not give us, as I pointed out, an indication of what it is really costing that company in wages that year. It is all relative. It does not matter if the company spent \$50 million, it does not tell us what we want. These are all things that certainly have not given me an indication as to what conclusions we should come to, and it is because of that fact we would like to have a breakdown. Could you give us a breakdown for these two tractors?

Mr. EMMERT: I would not be prepared to, Mr. Korchinski, because there again they have changed from apples to oranges.

Mr. MCINTOSH: What the members are trying to get at is that in one of your statements on page 11 you say:

This is reflected in the fact that farm machinery prices have risen generally in line with the cost of steel and labour.

If we had labour representatives before us, or if we had steel representatives before us, if they gave us the same answer, they would disagree with you that these have not contributed to the high cost of machinery. What the committee is trying to find out is whether you have anything on which to base that statement, that your labour has increased, that your steel has increased in producing a certain article.

Mr. EMMERT: I think, Mr. McIntosh, the data we have provided you with provides clear proof that the cost of labour per hour has increased. There can be no question about that.

Mr. MCINTOSH: The cost of labour per hour may be correct, but it may take half as much labour to produce that same article, and that is the point that labour will put before us. The actual money that the purchaser puts into that machine is no more than it was 25 years ago—unless you can prove otherwise to us.

Mr. EMMERT: I have no doubt that argument may be advanced. The plain fact of the matter is that the cost of labour has increased substantially per hour of labour.

Mr. MCINTOSH: Has automation reduced the number of men required to produce that one article?

Mr. EMMERT: Mr. McIntosh, automation is a very fine word, but it is not applicable to the farm equipment industry. Our runs are too small. I can think of no way to automate a combine line where we produce 8,000 and 10,000 a year in the variety we do.

Mr. HORNER (*Acadia*): Although you say you are a combine production line?

Mr. EMMERT: No.

Mr. McINTOSH: On the same page, page 11, you say:

We are determined to overcome these difficulties by selling higher quality products at fair prices and by giving more and better service.

I think you spend more on advertising. Is that one of the services which have contributed to the high cost of machinery and not, as you say, steel and labour?

Mr. EMMERT: Do I understand that the committee wishes to question the right of the company to engage in advertising?

Mr. McINTOSH: No. We are trying to get at what has contributed to the high cost of the machinery to the producer. Our terms of reference are to inquire into the price of farm machinery. If there is a lower labour content in the production of a tractor now as compared with 25 years ago, a lower price for the material than 25 years ago, then possibly our question would be, has the increase in the price contributed to a larger profit by machine companies—or it could be vice versa—to any one of the others.

Mr. EMMERT: May I suggest that what we are really trying to do is to over-simplify the matter that we are here to talk about. We have demonstrated to you that the cost of an hour of labour has risen, we have demonstrated to you that the cost of a ton of steel has risen. Now, what you are really asking us is how much labour you use to do it as opposed to several years ago. I reply that we are not building the same thing today as we were several years ago. We cannot make a proper comparison, Mr. McIntosh.

Mr. McINTOSH: You may not be using as much material.

Mr. EMMERT: In everything in life we endeavour not to use as much material, because it costs a lot of money.

Mr. McINTOSH: Or a cheaper material?

Mr. EMMERT: We control it to the best of our ability. We try to produce a satisfactory material without deteriorating in quality. In regard to the number 35 tractor, about which we spent so much time talking today, the tractor we are producing today in Detroit is a different article from the one we built two years ago, substantially different. To begin with, the power plant is different. Two years ago we installed a four cylinder engine in the diesel version of the tractor. Today it is a three cylinder engine. We have different ring gears, different pinions, a different fuel tank, different sheet metal, and different controls. This is not a static business to compare along a quarter of a century.

Mr. HORNER (*Acadia*): Because of the change basically from a four cylinder diesel to a three cylinder diesel, would not the labour component of the cost of producing that machine remain relatively constant? If the other factors remain constant, it would produce nearly as much in the case of the four as is produced in the case of the three, as far as the tractor going into that line is concerned.

Mr. EMMERT: Again, Mr. Horner, you are posing a question in the medium I am very sorry I am unable to answer. My inability results exactly from the point you have made. We buy that power plant as complete package. I have not the foggiest notion as to how many man hours go into a four cylinder engine, and how many go into a three cylinder. All I know is what we pay for the engine.

Mr. HORNER (*Jasper-Edson*): Do you feel that goes into the labour?

Mr. EMMERT: To the extent that labour has increased its cost?

Mr. HORNER (*Jasper-Edson*): Do you feel that the man hour to you has increased in cost?

Mr. EMMERT: I gather you mean the equivalent?

Mr. HORNER (*Jasper-Edson*): Do you feel that it has not?

Mr. EMMERT: I gather that it has not.

Mr. MUIR (*Lisgar*): If this is a matter of costs, perhaps we could get to a better pace if we started out on repair parts. One of the great complaints this committee gets is that excessive costs occur to the consumer or user by repair rather than getting a component part of the machine when it is built. I think I cannot tie this to hourly wages. I think it would be better to tie it to a unit cost. If you take a given sprocket, you have, say, three men putting out these sprockets, or, say, one man. You should be able to break down his wage in the cost of that sprocket, if he or perhaps two or three others are the only persons who are making this.

Mr. EMMERT: Mr. Muir, we were informed that the conversation might turn to sprockets, so I have gone to a good deal of trouble to do a little studying and research about that subject. In the first place we do not produce enough of very many sprockets in our Canadian operations to have a man, or some men, all the time making sprockets.

Mr. MUIR (*Lisgar*): For your combine?

Mr. EMMERT: It does not work that way. A machine, perhaps a \$25,000 Bullard machine must be retooled in the course of a production season many times to make a variety of sprockets. Furthermore, we do not have control over the labour force sent into factories to make sure that the same man is working on that machine all the time. Men will be moving along, if there is an opportunity to better themselves or if there is a lay-off. Then our entire force can be disrupted. Therefore, it is a complex thing and not a simple thing to do with repair parts of sprockets. There are a very great many costs, the costs of doing business are very difficult to account for, that go into the repair parts price for a sprocket. We are required to carry a certain number of parts. It varies according to the province. We are required by our own conscience to live within what we think of as our integrity, to carry spare parts. We have—I think this is mentioned in our brief—some 85,000 different and specific part numbers and we have to keep track of them and keep an inventory and attempt to have the right supply at the right time. The parts business is a great guessing game. I wish I knew today, and so does Mr. Forsyth, how many sprockets for any given combine would be required in western Canada during the harvest season. If we knew it we certainly would ship exactly that quantity. All we know is that we will ship either too many or too few. If we have shipped too few, we have to express some more; if we have shipped too many, we have to carry some over and that increases the inventory charges. Sprockets for a machine five or six years old may or may not be anything the same as are produced by a production machine. There may be buying of new material and we may tear down one machine and have a new set-up in the production, and that would mean a completely new handling in spare parts.

Mr. MUIR (*Lisgar*): That is what you attribute the high cost of spare parts to?

Mr. EMMERT: Well, the word "higher", Mr. Muir, is a relative word. Are you comparing it to the cost of a spare part ten years ago?

Mr. MUIR (*Lisgar*): I am comparing it to a part that was put out on the new machines.

Mr. EMMERT: I am not aware that we issued the price list of a new machine broken down by new machine parts.

Mr. HORNER (*Acadia*): It has been said that if you bought all the parts making up a new machine, it would cost five times the price of a new machine. That is what Mr. Muir means.

Mr. EMMERT: Perhaps you are right. It has often been said, but we have not said it.

Mr. HORNER (*Acadia*): Well, it has been figured out by parts men.

Mr. MILLIGAN: Do you have control of mark-up on spare parts?

Mr. EMMERT: The parts pricing starts out with a suggested maximum retail price in accordance with the laws of the land. This is all we are allowed to suggest. A dealer price is then established, and the difference between the dealer price and the suggested retail price varies by classification of parts.

Mr. HORNER (*Jasper-Edson*): And, dealers.

Mr. EMMERT: Not of equivalent volume.

Mr. HORNER (*Jasper-Edson*): That is what I am getting at.

Mr. EMMERT: Any dealer, with equivalent volume, buys at the same price. As a matter of fact, all dealers buy at the same base price.

Mr. MILLIGAN: What is your suggested mark-up?

Mr. EMMERT: It varies from part to part.

Mr. HORNER (*Acadia*): I have a supplementary question to that.

The CHAIRMAN: Well, that will be the last supplementary on this, as I want to get back on our list.

Mr. NASSERDEN: Before we leave that, Mr. Chairman, there was this question in connection with labour, steel and transportation costs, and I am still not convinced that we cannot have that information.

The CHAIRMAN: Could you bring that matter up again? I would like to get back to the list. I already have entertained a number of supplementary questions.

Mr. GUNDLOCK: My question was supplementary to this same question, Mr. Chairman.

Mr. HORNER (*Acadia*): Mr. Chairman, I had a supplementary to Mr. Milligan, and you were going to allow me to ask the question.

The CHAIRMAN: I am saying that we are getting away from the subject, and I want to give every member an opportunity to get in on the discussion.

Mr. NASSERDEN: Mr. Chairman, I see no use in passing over these things. I think we should get one thing settled at a time.

The CHAIRMAN: I will entertain your supplementary question now, Mr. Horner.

Mr. HORNER (*Acadia*): Mr. Emmert, I am going to read a statement produced by the dominion bureau of statistics. This statement was given in evidence before this committee, and I would like to ask you whether or not you agree with it. The statement reads as follows:

For the most part, wholesale prices are increased by 31 per cent to take care of the retail mark-up.

This retail mark-up percentage was obtained from one of the leading Canadian farm implement journals. Is this a relative figure, or is it too high or too low?

Mr. MCINTOSH: I do not think that Mr. Emmert is qualified, as a manufacturer, to answer for a retailer.

Mr. HORNER (*Acadia*): Well, this was obtained from a Canadian farm implement journal and, certainly, they publish their prices.

Mr. EMMERT: Mr. McIntosh, thank you very much.

Are these figures about which you are talking, Mr. Horner, produced by D.B.S.?

Mr. HORNER (*Acadia*): Yes.

Mr. EMMERT: They really are in quite different terms than we are accustomed to talking about amongst ourselves, or with our dealers.

I think you really are talking about the retail method—about the difference between what they pay and what they hope to sell it for.

Mr. HORNER (*Acadia*): Yes.

Mr. EMMERT: And, at this point, I agree with Mr. McIntosh; I am not qualified.

Mr. McINTOSH: What I meant is that it is not fair to ask you that question.

Mr. EMMERT: I am not qualified because our retailer has his own method of marking up his cost. All we do is establish a suggested maximum retail price, and then we establish a dealer price.

Mr. HORNER (*Acadia*): All the dealers certainly have a price list of repair parts. Any time I go in to buy a machine or parts for it, they check through a catalogue, and it may be number so-and-so; then they look over to the price, and it is so much, which is the price I pay for it. It is published by the machine company.

Mr. EMMERT: We do publish a suggested parts price list, but all dealers do not sell at that price, nor have we any way of determining in what instances they do or do not.

Mr. KORCHINSKI: What is the criteria you use in establishing these suggested prices? For example, let us take a crank-shaft. Let us get away from the tractor for a while.

How do you figure out the cost of a unit for sale, if it is a crankshaft, a boxing, or what-have-you? How do you go about that?

Mr. EMMERT: Well, Mr. Korchinski, if I may suggest it, let us talk about how we price an oil filter. I think I could be perhaps a bit more clear for the benefit of the committee.

I refer you to our brief, where we say that our prices are set in respect of the demand and the market. Now, if we were to price our oil filters for our machines at a price higher than that which a customer could buy an oil filter, from another source, we would not sell any.

Mr. KORCHINSKI: That is fair enough with oil filters, but I am unable to buy a Massey-Harris crankshaft from a John Deere dealer.

Mr. EMMERT: That is why I suggest an oil filter and not a crankshaft. If we charge an exorbitant price, in your eyes, for our crankshaft, or exorbitant in comparison with a similar crankshaft from International Harvester or John Deere, you are going to be dissatisfied with our tractor, and you are not going to buy it the next time because you will say it is too expensive to keep up and maintain. Again, we are caught in the millstones of the demands of the marketplace. If we can obtain, in price, that which covers what we assume to be our costs on that, we are very happy.

Mr. KORCHINSKI: Are you suggesting that the price of machinery is what it is because the farmers have been buying it continually?

Mr. EMMERT: Well, I did not beat my wife before I came, and I do not propose to acknowledge that kind of question.

The CHAIRMAN: I think we should get back to the subject. Mr. Rapp, you are next, followed by Mr. Danforth and Mr. Milligan.

Mr. RAPP: Mr. Chairman, on page 17, the brief outlines that from 1944 onward the company has continued to reduce the number of dealers. My

question is this: Has this resulted not only in better service to the customers, but in a savings on a machine, or has only the company had such a savings?

Mr. EMMERT: Mr. Rapp, in answering the latter part of your question first, it is quite evident from our very unsatisfactory profit performance that the company has not benefited particularly from the depletion in the number of dealers. Those steps were undertaken, first of all, because of changed circumstances. You will recall that we recited initially, that, some twenty years ago these people were really order-takers; they did not have any service responsibilities, collect from the farmers or service the accounts. They had a Massey-Harris sign, and if someone wanted to order a piece of Massey-Harris equipment, they took the order. Today it is different. The dealers we have today are intelligent businessmen.

I have a man here, namely, Mr. Forsyth, the general sales manager in charge of Canada, who has more knowledge on this subject than I, and, furthermore, has been in industry through almost this entire period.

Mr. Chairman, would you care to hear from Mr. Forsyth?

The CHAIRMAN: Yes.

Mr. FORSYTH: Mr. Rapp, and gentlemen. Mr. Emmert, although I do not want to correct you, I am sorry to say that I was through all of it. I presume this is the subject of frequency of dealer location of which you are speaking, which is covered here and dates back to 1935. There are many references to different points.

Through these years transportation communication, as stated in the brief, has caused the purchaser to migrate, shall I say, to larger trading centers for his purchases. As we stated at page 14, we made reference to the increased length of normal life and, in that case, it is tractors. What has happened in this: There is a continued demand for a wider variety of services for both older and new machines. Of course, this means that those people who Mr. Emmert has pointed out have to make a much more substantial investment in their business. After studying the matter very carefully over these years, it became apparent that the customer rightfully was demanding better service than a dealership was given. He was demanding better technical service, and a better variety of parts. We found that the only sensible way of doing this was by giving that dealer an area large enough to properly operate in so that he could maintain a better variety of parts, so that when you went in to see him you could expect to get at least the fast moving parts right off his shelf, and at the same time, if he could obtain something like a reasonable return on his investment, he would give the customer better service in the end. As a result, with the thought of better service in mind, we have more strategically located our dealers, and we have made greater demands on them by way of increased inventories of repair parts, increased service facilities, and, of course, all the other things that have been mentioned, such as him being a dealer rather than an agent. Does that answer your question?

Mr. RAPP: No, it does not, because if the company had not received any savings and these savings were not passed on to the customer, well then, the customer or the farmer had to pay much more for repairs in this way because, whereas he only had to go to a hamlet to buy a sprocket for \$3, it now costs him \$2 to go to the place to buy a \$3 sprocket, because it is fifteen or twenty miles away. In this way, the upkeep of a machine costs much more than it did before you actually had reduced the number of agents in a given district.

Mr. EMMERT: May I speak to that?

Mr. Rapp has said already that the record would demonstrate, whatever benefits had accrued, they would not accrue to the profit of the

company. I think it is fair to say that had such actions not taken place, that is to say, if today we still had to service 2,500 dealers, and had to carry inventories in that many places, then the farmers would be paying more for their machinery. It follows that this was an uneconomic distribution set-up which we had before.

Mr. PETERS: What is your arrangement with the dealers in relation to obsolete parts? I understand International Harvester carries an open price list and, as long as the parts are on that price list, there is a period of time each year in which the dealers can send back their stock of any particularly slow moving parts. Do you operate on that basis also?

Mr. EMMERT: I do not know International Harvester's plan in detail, but we have a plan which encourages our dealers to send back such parts. I think it is annually, Bill?

Mr. FORSYTH: That is right.

Mr. EMMERT: Under the plan they are allowed to send back a percentage of parts, related to the volume that they purchased from us. This is done so that the dealer's stock of parts can be kept up to date. That is to say, if a dealer makes a mistake and orders too many of one part we do not want him to be stuck with that. What we want to do is get the spare parts back into the stream of distribution again. However, I do not know what International Harvester's plan is.

Mr. PETERS: How long do you keep parts on a current price list?

Mr. EMMERT: That varies, in accordance with the sale for the particular part. If there is a reasonable movement, and I think today we describe that as being 10 or 15 part numbers per year, then it remains as an item on the current parts list price. If the sales per year fall below a certain level, then it switches from that current parts price list to another parts price list. The length of time that we would carry parts is, therefore, varied by the requirement for the part. It has something to do with the inherent life of the basic machine, how long does the customer keep using it and how long is it useful to him. We carry parts in our stocks today for farm machines which are—how old, Bill?

Mr. FORSYTH: 25 years old. We have some parts for our machines as old as 25 years.

Mr. PETERS: You have a legal requirement that they will be kept for 10 years?

Mr. EMMERT: There is a requirement on the part of certain of the provinces that we keep them for a specified number of years. I think the overriding requirement is the one I mentioned earlier. It is our own conscience, integrity and selfishness because, if we do not provide parts service we are going to lose a customer.

The CHAIRMAN: Have you any further questions, Mr. Rapp?

Mr. RAPP: No.

Mr. DANFORTH: I should like to pose a series of questions to Mr. Emmert and I believe they require only answers of "yes" or "no". They deal more with principles rather than specifics. I think members of the committee have been very much impressed by the fact that your company has 24 factories in 10 countries, and I think we are pretty well in agreement that most of the machine companies today are international in scope. So I presume the questions I pose will deal with all, or most, of the machine companies, rather than with a specific individual company.

Now, you said in your brief, and very frankly, that your company's main objective is to operate at a profit. We can accept that and we can assume that

sound business principles are implemented at all times in the operations of your company. That is the preface to my questions. Since you are international in scope and, in your brief, you state it is difficult to separate profits made on domestic manufacture from profits made on similar goods imported, and you also state that with the movement between Canadian and United States plants it is impossible to separate the profits between plants—at least, that is the impression I got—I would assume from these statements that the business of Massey-Ferguson is operating as an entity, as a big company in ten countries, but it is one company. Am I correct in assuming that?

Mr. EMMERT: Yes, that is true. Massey-Ferguson Limited is the parent company and the United States company, for legal reasons, is Massey-Ferguson Incorporated, but it is a wholly owned child of Massey-Ferguson Limited.

Mr. DANFORTH: Then we are dealing with one company. Now, may I pose these questions? Is it conceivable, due perhaps, to economic losses in one country in an operation of one segment of your company, to have that balanced off in the price of Canadian machinery in the following year? I ask this because the company, as you have stated, is designed to operate at a profit. Is it conceivable that even just a small percentage—no, I want to get down to principles—that a loss in one part of your world-wide corporation's operations could cause an increase in the price of your North American products, within the balance of competition?

Mr. EMMERT: You said you hoped for a "yes" or "no". Perhaps you will not like this, but the answer is no.

Mr. DANFORTH: It is not conceivable?

Mr. EMMERT: Not within the terms of the market in which we operate. It is inconceivable that a loss on the part of an element of our company that operates in, say, Brazil, could affect the price that we could charge in Canada for a given product because, unfortunately, our competitors could not care less whether we are making a profit in Brazil.

Mr. NASSERDEN: But they could be faced with the same proposition as you would be?

Mr. DANFORTH: That is my point—since all the companies are international in scope.

Mr. EMMERT: You, Mr. Danforth, made the statement that all companies were international in scope. I did not disagree with it because that is generally true, but it is another one of those generalizations which needs a little definition. Far more of Massey-Ferguson's business is done outside North America than is done by our competitors. International Harvesters and John Deere are certainly international companies, but they are not internationally dependent to the same degree as we are. Their large markets are here in North America.

Mr. DANFORTH: That leads to a second, specific question. Is it conceivable that a competitive war, in perhaps a new market field where, in order to obtain a market you would introduce your equipment at cost of product or less, would have any bearing on the overall cost of Canadian machinery?

Mr. EMMERT: Mr. Danforth, I would have to give the same reply. The market conditions here establish the price of equipment in this market. If our associates wished to do or take some action elsewhere in the world it does not follow that it affects, either upward or downward, the price of farm equipment in Canada so far as we are concerned.

Mr. DANFORTH: That leads to the very question in which I am most interested. Can we take it from your statements, even on a competitive basis, there is very little difference between the prices charged for tractors by the different companies if the prices were broken down on a horsepower basis?

Mr. EMMERT: I am afraid I do not understand that, Mr. Danforth. Does that go back to something we were talking about?

Mr. DANFORTH: Perhaps I can rephrase my question. Tractors now, instead of being rated as horsepower, are rated as 2, 3 and 4 plow tractors and diesels, and between companies they vary in horsepower from say, 3 to 5 horsepower, or whatever it may be. My question is this: Is it a fact that broken down on a per horsepower basis there is very little difference between companies on the prices of tractors?

Mr. EMMERT: I am afraid, Mr. Danforth, I would have to ask you to define the words "very little". We do not, as you assume, price our tractors per horsepower as related to our competitors. However, we do take into our reckoning the amount of work our tractors will do in relation to a competitor's tractors. We then look to the features which we think are worthwhile to the farmer, and we will adjust our prices in relation to competition for those features. If, for example, our tractor has a foam rubber seat and a tractor of equivalent power manufactured by our competitor is offered with a standard steel seat, we believe we are entitled to more money but, I can tell you, we will then turn around and offer another tractor with a steel seat.

Mr. DANFORTH: Would you be surprised sir, if an estimation were made of all the tractors on the market today and it were broken down to a horsepower basis between, say, a 35 horsepower tractor which you put out and a tractor put out by another company which has 45 horsepower,—would you be surprised to learn that the difference, on a horsepower basis, was, in effect, very few cents?

Mr. EMMERT: In relation to the first part of the question I would have no reason to be surprised because I presume our competitors are at least as efficient as we are. In relation to the second part of your question, if you take the broad range of tractors then I would be very much surprised to find that an 85 horsepower tractor sold for as much per horsepower as a 20 horsepower tractor.

Mr. DANFORTH: I am speaking of competitive tractors, 85 horsepower as against 85 horsepower. Now, I have one further question and I do not want to take up the time of the committee. I believe it has to do with a statement made this morning or, perhaps, it was something in the brief related to the moving of old stock and, by old stock I mean current model stock. I believe standard discount incentive is given to dealers to take a percentage of current stock before a new model is brought in. I believe this is current with one machine company, that it tries to move all stock on hands when a new model is contemplated, or actually is in the process of manufacture. Now, since this is strictly a business, worked on business principles, is it a fact that this is taken into consideration whenever a price is established on a model and that there is, in effect, a margin of profit over and above normal to take care of such a contingency?

Mr. EMMERT: Mr. Danforth, I think you are referring to page 18 where we state:

As a sale incentive, we frequently give our dealers special pre-season discounts which, in addition to stimulating sales, help to stabilize employment in our highly seasonal industry.

Is that not the reference, Mr. Danforth?

Mr. DANFORTH: I can understand that part of it, but it was in reference to the movement of surplus stock of a particular model. Let us say that combine A is being supplanted this year, or is contemplated to be supplanted by

combine B, which is quite different in scope, with a lot of improvements, and that you have a lot of stock on hand. Therefore to reduce your inventory, you are going to give the dealers an incentive to purchase in order to move these combines.

As you have stated, you contemplate the sales in any particular field as to the number of units. Is that not a factor in the pricing of machines? I mean the fact that you cannot establish the number of units?

Mr. EMMERT: No, it is not a factor in the pricing of the machines. But it is certainly a factor in the ultimate profit outcome of the company. If we find that we are overstocked, we must provide an incentive to our customers, to our dealers to move that merchandise. This will have an effect on the hoped-for profitability of the year.

Very often in this industry the companies find it necessary to reserve against the year's operation what they expect they may have to reduce the price next year. It is called the principle of reserve accounting. The principle of reserve accounting is followed in the industry. That has nothing to do with pricing.

We do not put any margin in the initial pricing structure to account for whatever reserve we may have to throw out. That is why we continuously strive to do a better job in the estimate of our requirement position so that it may be distributed properly, and so that they will match the market that exists. There is nothing we can do about catastrophe, drought, and things like that. But we still think there is a substantial amount within this industry to be done to eliminate some of the dangers we faced in the past in respect to other than catastrophes.

Mr. DANFORTH: I have one other question. This has to do with generalities. I certainly do not want to be misunderstood about it, but it is a question I would like to pose for the record.

What reason have we to believe, when you say that prices are set on a competitive basis—what reason have we to believe or what substantial argument can you give us to the effect that since you have stated that labour is an intangible, and that for the steel for the different machines it is not possible to give us a breakdown—what argument can you give us that there is in effect any competition, but an agreement between the manufacturers to establish prices?

Mr. EMMERT: I would not propose to give you any argument except my word. In the first place, it would be a complete contravention of the law of the land. We do not participate in that sort of thing. There can be no argument about it, because I do not propose to argue with the law.

Mr. DANFORTH: That is why I asked. I have been misunderstood. A company as big as Massey-Ferguson, and the other machine companies involved, certainly are not going to do something which would contravene or break the law. We will accept that. But what can you give us as an illustration in the way of there being competition and not combination?

Mr. EMMERT: Perhaps I could point out to you that if all the competitors in a given field built an identical machine, and the prices were reasonably close, then there would be some reason for suspicion. But in fact the machines are not identical. They are different.

I understand there may be some feeling that the machines should have more identical features, and more interchangeability as between manufacturers. But we do not subscribe to that for the reasons which we have set forth.

We are selling different machines. What we are attempting to do is to sell to our customer and prove and demonstrate to him that our machine with its features, at about the same price, is a better machine, and that it will in fact do a better job for him.

Mr. DANFORTH: Thank you, sir.

The CHAIRMAN: Now, Mr. Gundlock.

Mr. GUNDLOCK: Mr. Chairman, we, in this committee, are here to investigate the high cost of machinery in relation probably to former years. Now, in that investigation I find myself wondering how we are going to analyse this thing and to reach some overall conclusions if we cannot have from the machine companies the various cost components contributing to the rise, such as capital costs, depreciation, transportation, labour, and so on down the line.

I would just like to ask Mr. Emmert in view of his remarks how he expects the committee to come to some conclusion if the company itself cannot establish the various component costs, and component relationships? In other words, we are here to find out why, and the reasons for it.

Mr. EMMERT: Mr. Gundlock, as we understood the terms of reference, they stated that the standing committee on agriculture and colonization be empowered to inquire into the prices of farm machinery, and to report to the house thereon.

Mr. GUNDLOCK: All right.

Mr. EMMERT: It does not say the high price.

Mr. GUNDLOCK: All right.

Mr. EMMERT: The terms of reference say nothing about the costs of the industry. It says prices of the machinery. So I can only suggest to the committee that your purpose will be served by comparing the prices of machinery with the prices of other commodities.

I do not think your purpose will be served by attempting to compare the prices of machinery with the assumed cost of the machinery. There you have our financial statement in terms of the royal commission, and we have delineated it to a far greater degree than they did. That is to say, we have taken you right through, over the years, since they left off, and it is obvious that the profit potential in the industry is not great.

I am beginning to feel, Mr. Chairman, that the purpose of the committee is to question the cost element, but this was never in the terms of reference, nor have we prepared anything on that basis. I have assured you that if we had information to give you, it would be meaningless in terms of past years.

Mr. GUNDLOCK: I have one supplementary question. Could you tell us more about what you have to say at the bottom of page 10 of your section B,—could you give us the relationship between this and over-all profit?

Mr. EMMERT: What is that?

Mr. GUNDLOCK: You have some net income figures.

Mr. EMMERT: This is exhibit 10?

Mr. GUNDLOCK: No. I am referring to page 10 of section A of your brief, the net income figures. Would you give me the relationship between income and real or over-all profit?

Mr. EMMERT: Perhaps Mr. Penney would like to describe net income for the committee. Would you like to define it?

Mr. N. H. PENNEY (*Controller*): Net income, as we use it here, is the same as we defined it in our statement. It is income or net after all expenses have been taken, and after income tax has been paid.

Mr. EMMERT: I could refer you to exhibit 11 in section B, where you would find a more detailed tabulation.

Mr. GUNDLOCK: No, really what I am asking for is this: what is the relationship to income? Is it synonymous?

Mr. EMMERT: Do you mean: do we have any way to delude the tax people?

Mr. GUNDLOCK: No. I think you know pretty well what I mean. Is it the same as real and over-all profit?

Mr. EMMERT: Net income and net profit are identical.

Mr. GUNDLOCK: No. I said real and over-all.

Mr. EMMERT: Then you will have to define what you mean by "real".

Mr. NASSERDEN: This 2.7 per cent of the dollar sales, of your total dollar sales—what does that represent percentage-wise to the capital investment of the company?

Mr. EMMERT: Well, let us go back to exhibit 11.

Mr. NASSERDEN: What is the page?

Mr. EMMERT: It is under section B of the brief, the last page of section B. If you take the year 1960, with \$490 million worth of sales and \$201 million of capital and retained earnings, plus \$93 million of long-term debt, the net income for the year, that is to say, the profit after tax, is \$13.1 million.

John can work it out percentage-wise very promptly.

Mr. KINGSMILL: For 1960, six and a half per cent. That is net income as a percentage of capital and retained earnings.

Mr. EMMERT: But you include the long term debt.

Mr. KINGSMILL: It would be a little below four and a half.

Mr. NASSERDEN: In addition to that you pay interest on the investment. The interest on this capital investment is provided in the expenses.

Mr. EMMERT: No; I am afraid not. We are not obliged to pay interest on that amount of money. Our shareholders hope that in respect of that amount of money they will receive a dividend which must come out of the \$13.1 million net profit.

Mr. NASSERDEN: Perhaps I am a little mixed up. Your financial statement lists the debt of the company. This is on page 20. The long term debt is listed there with the interest which is paid on it. I take it you pay that and that is taken out as expenses; is it not.

Mr. EMMERT: The interest on the long term debt is an expense item. The interest on our short term borrowings is also an expense item. There is no interest payable, nor charged in respect of the capital and retained earnings.

Mr. MILLIGAN: Is the 2.7 per cent profit you have after the dividends have been paid out?

Mr. EMMERT: No sir; it is before dividends.

Mr. MILLIGAN: What rate of dividends were paid on Massey-Ferguson shares?

Mr. EMMERT: Currently they are running forty cents per annum per share. That has been the experience for the last two years.

Mr. NASSERDEN: Did any of your subsidiaries show a loss for the year that is shown in this statement?

Mr. EMMERT: Truthfully I cannot answer that. I do not know.

Mr. GUNDLOCK: I will take back all those adjectives I used formerly and still come back to the question. The costs in the price of machinery today here in Canada are appalling. I cannot quite understand why we cannot have the various components which contribute to the price, whether it is high, low or whatever it is.

Mr. EMMERT: I have done my very best to explain to you the practical impossibility of providing you with the kind of information you are hoping to get.

Mr. GUNDLOCK: What you say is that in your cost accounting branch in the company you do not have certain figures for labour, transportation and overall figures concerning your operation. In the overall figures there must be a certain cost for certain things. Otherwise, how do you arrive at your overall cost?

Mr. EMMERT: True. I suggest to you once more that those figures would be absolutely meaningless in the context of the price of Canadian farm machinery.

Mr. GUNDLOCK: I accept the fact that you are a world-wide organization. What is it in a world-wide sense?

Mr. EMMERT: There I must refer to the terms of reference.

Mr. HORNER (*Acadia*): Surely the committee was ordered this year to inquire into all such matters that may be referred to it. This year in our reference we were asked to look at the cost of farm machinery. In inquiring into the cost of farm machinery surely it is the committee's duty and main business to find out why machinery costs are as high as they are.

Mr. GUNDLOCK: Or as low as they are.

Mr. EMMERT: Or just where they are.

Mr. HORNER (*Acadia*): Yes. Surely it is true we must know what makes up the cost of farm machinery in order to arrive at any accurate study of the question.

Mr. EMMERT: Mr. Horner, we have demonstrated to you that our total costs come within that much of our total income.

Mr. GUNDLOCK: I do not care if it goes down below.

Mr. HORNER (*Acadia*): You publish your annual report. In arriving at this year's statement you have the cost of goods sold, roughly \$390 million. Perhaps at a later date you could provide us with what goes in to make up that \$390 million.

Mr. EMMERT: In the cost of goods sold?

Mr. HORNER (*Acadia*): Yes. Perhaps you would provide the committee with that information at a later date.

Mr. EMMERT: I would be quite prepared to advise the chairman if that is possible.

Mr. HORNER (*Acadia*): Further down in the same statement I see that you have attributed to direct depreciation and production tooling a cost of \$18 million for 1960. Surely you always run a reasonable cost analysis of your business. Even in your further statement to my question as to how you arrived at the costs in respect of selling prices you said you keep in mind the competitive products and what prices they are selling at, and then set prices which will cover the cost of doing business.

M. EMMERT: Hopefully.

Mr. HORNER (*Acadia*): I wonder how you arrive at the cost of doing business. Take your new tractor of the past year or so, the MF 55. Here was a new tractor only made for your North American market to start with. How did you arrive at the price of that machine?

Mr. EMMERT: In the first instance the machine was intended to be designed to be competitive price-wise with tractors already marketed and merchandized by International and Deere, and so on. There had to be an estimate made by our company as to the volume of the machines we might produce, and then from that estimates as to the capital cost for machinery, the capital cost for tooling, the estimated cost of labour, material, and all the components which go into it. However, lots of things happen in that time.

Mr. HORNER (*Acadia*): I just used this tractor as an example, because it is a new product. In coming out with this tractor you have taken into consideration the competitors' prices. You feel you can put out a tractor price-wise which is competitive. In taking up an analysis of a proposed tractor what happens, for instance, in analyzing your cost of that tractor if your price is not competitive? Do you still go ahead with production?

Mr. EMMERT: We are faced with just that sort of management decision day in and day out. The fond hopes which we put together when we start to design a plan to market a new product very often go astray. We then really have three options. We can say, well we will extend the period of time in which we hope to sell this machine and attempt to recover costs over a longer period of time. We can say we must now go back and redesign the machine in an attempt to take costs out, say in the form of features or weight, or something like that. Or, we can say that as our sales with new products in the last four or five years are not competitive, we will get out of this business.

Mr. McINTOSH: Could I say this. In respect of retail farm machinery the D.B.S. index has progressively been increasing, much as your M-F index has. Do you take into consideration the gradual increase in D.B.S. figures and apply it and say that the trade will stand that much more this coming year, in arriving at your costs?

Mr. EMMERT: No, we do not, sir. The D.B.S. figures come out late, to begin with, and they would be of no value except as history. I think all they reflect is the same set of circumstances impinging upon all our competitors, as well as upon ourselves. That is all they do.

The CHAIRMAN: Gentlemen, the question of our terms of reference arose this afternoon. May I remind the committee, and also our witnesses, what the order of reference was. I shall read the full text of it. I am reading from Hansard of March 14th, 1961:

Resolved that the standing committee on agriculture and colonization be empowered to continue its inquiry into the question of prices of farm machinery as recommended by the said committee in its fourth report presented to the house July 28th, 1960, and that the committee's minutes of proceedings and evidence with regard to this inquiry at the last session be referred to the said committee.

I want to read to you at this time at least part of the fourth report.

The committee recommends

(2) that the ministers of the different government departments concerned, instruct their officers to offer every assistance to the persons designated by the committee to procure and compile all available facts regarding farm machinery prices.

Gentlemen, we are endeavouring to find out all available facts in connection with farm machinery prices.

Mr. GUNDLOCK: Does that apply only to departments?

The CHAIRMAN: No, to the whole committee.

You are next, Mr. Smallwood.

Mr. SMALLWOOD: Mr. Chairman, I would like to move to exhibit No. VII and discuss the prices of these combines. We might get some answers in respect of this exhibit. I note here a list of prices. In 1960 I see you have recovered from the dealer \$5,673. That combine, in Canada, is selling for nearly \$9,000. Are you intimating that the dealer is getting the difference?

Mr. EMMERT: Would you care to comment on this question, Bill?

Mr. FORSYTH: Mr. Smallwood, I do not have a price list with me. That is a suggested retail price list. However, those prices would be for standard equipment. The model to which you are referring is a super 92 combine. In this case, it is f.o.b. Toronto. That is where this combine is priced. This would be the net payment, under settlement by the dealer, for that machine, whereas when you speak of a machine selling for \$9,000, or in that neighbourhood—\$8,500 or \$9,000, that would include your freight charges to either the dealer or the branch, then the branch to the dealer, according to how he got it, set up charges, if he made them, and the dealer's margin of profit. That would be the pluses which would go onto that figure.

Mr. SMALLWOOD: The dealer's margin of profit?

Mr. FORSYTH: Yes. This one you are looking at here is f.o.b. Toronto.

Mr. SMALLWOOD: Yes.

Mr. FORSYTH: Then, too, I presume that normally when you are speaking of a machine in the neighbourhood of \$9,000, you are including a pickup with that, as well as a rotary screen. I think lights are standard. As I say, out of that difference the cost of the other items,—these components to which we refer as extras—would be added to this price, the dealer's cost thereof, before you would have a fair comparison with the delivered price, say at your home. This is f.o.b. Toronto. Whatever that difference might be would be what the dealer has to operate his business on. He takes your trade-in, reconditions it and re-sells it. All these things that go into running a dealership have to be taken into consideration. Does that answer your question?

Mr. SMALLWOOD: Yes, but I have some more questions. I might say that I was quite surprised in this connection, and I phoned Alberta and found out last fall that it was costing them \$7,000 for a machine which you quote at \$5,600. It costs another \$1,400 in the west.

Mr. FORSYTH: I would have to question that.

Mr. SMALLWOOD: Well, it is not necessary. It is correct.

Mr. FORSYTH: I would have to question the \$7,000. I presume that you obtained that reference from a dealer out there.

Mr. SMALLWOOD: It is absolutely correct.

Mr. FORSYTH: Well, if the reference you got incorporated the same equipment as this price entails—

Mr. SMALLWOOD: You have the bare combine.

Mr. FORSYTH: It is a bare combine, whereas, in your area, and in most of the areas of western Canada, it is normal to refer to a combine as including a rotary screen pick-up—and I do not know why I cannot think of these extras fast enough—and that sort of equipment. So, if you ask the dealer to show you his price list, at the top of the page the words "on regular equipment" appears. A pickup is something in the neighbourhood of at least \$550. That is only an approximate figure.

Mr. SMALLWOOD: I would like to go back to 1953, where you have \$4,146 and, in 1954, you have 4,295. Was there any improvement in your machine that year?

Mr. FORSYTH: Between 1953 and 1954?

Mr. SMALLWOOD: Yes.

Mr. FORSYTH: I could not answer your question specifically.

Mr. SMALLWOOD: Maybe I should tell you. It had sealed bearings put in that year, throughout the machine.

Mr. FORSYTH: Was that the year? I was not sure.

Mr. SMALLWOOD: It does not seem to me that you have raised the price very much, after putting all those steel bearings in, and I cannot understand the reason for it. The next year you put in the dynaflo shoe system. Then, you did not make many improvements from then until 1958. I am acquainted with all this equipment, and I am tracing this through.

After these two years you kept climbing up to \$5,400 before there was again a big change. Are you able to comment on that?

Mr. FORSYTH: I cannot, without the records before me, I know we put the sealed bearings in after the 90 came out.

Mr. SMALLWOOD: The next year.

Mr. FORSYTH: The shoe, to which you referred actually is a trade name. It is a dynaflo shoe, and it was changed somewhere in that area, I know.

Mr. SMALLWOOD: That is right.

Mr. FORSYTH: I believe there was a larger gas tank.

Mr. SMALLWOOD: Yes, sure, but that doesn't make the combine any more efficient.

Mr. FORSYTH: No, but it has increased it to some degree.

Mr. SMALLWOOD: And you moved the grain tank from up here to down there, and ran the exhaust pipe from up here and back there, but we are directing our questions to the efficiency of the machine.

Mr. FORSYTH: You are relating these two prices from 1954 to 1960.

Mr. SMALLWOOD: Well, from 1953 to 1958, because there were five years in there, and changes were not too great, although the price kept going up.

Mr. FORSYTH: Well, in this respect I would have to refer the question as to why they went up to the man who knows the labour prices and all the rest of it. I presume this would be related to one of these charges.

Mr. SMALLWOOD: You do not know that?

Mr. FORSYTH: I do not know that.

An Hon. MEMBER: And nobody else does, either.

Mr. SMALLWOOD: Mr. Chairman, I have one further question in regard to the conveyor chain. It is like a sprocket. The conveyor chain for the No. 90 combine three years ago cost roughly \$75, and this year it cost \$106, yet it is the same chain. I would like to know the reason for that increase in price.

Mr. FORSYTH: This is from the table to the feeder.

Mr. SMALLWOOD: Yes. It weighs around 75 pounds. Three years ago I purchased it for \$75, and, last fall I paid \$106 for the same chain. What would be the reason for this?

Mr. FORSYTH: I am not in a position to give you any answer to that question. You are perhaps quite correct in saying that, as you are the one who is buying them.

Mr. SMALLWOOD: Yes, that is true. These are the types of questions to which we would like to have answers.

Mr. FORSYTH: I do not have information on which I can give you an answer to that because, as Mr. Emmert pointed out, we have not the prices here.

Mr. SMALLWOOD: Well, the dealer went to the Massey-Harris book, opened it up, checked his list, and there it was.

Mr. FORSYTH: Yes.

Mr. SMALLWOOD: If we are unable to get answers to questions like that, I do not know what good it is in asking them. We are here to find out the

reasons for these things. When we return to our constituencies, our constituents are going to ask us what we have done.

Mr. FORSYTH: This is the vertical elevator chain?

Mr. SMALLWOOD: Yes, the conveyor chain on the combine.

Mr. FORSYTH: Yes. You say it cost you, three years ago—

Mr. SMALLWOOD: Around \$75, and it went up to \$106 last fall.

Mr. EMMERT: I do not have any better answer for that question than Mr. Forsyth, but without attempting in any way to be impertinent, let me ask you a question.

Mr. SMALLWOOD: Fine.

Mr. EMMERT: Did everything else remain static in price during that period?

Mr. SMALLWOOD: Perhaps I could answer you in the same way as you answered us and say that it is not in the terms of reference.

Mr. EMMERT: Touché.

Mr. MILLIGAN: This question refers back to advertising and promotion, which appears to be making a major contribution to high prices of farm machinery. Can these costs be reduced—for television programs and such like?

Mr. EMMERT: The answer to your question is that we could certainly hope for that and we would do our best to reduce them and contain them. I sense a certain amount of wonderment, perhaps, on the part of the committee as to why we use the media of television. I can answer that very simply. It is because we think that that provides us with our best value for the advertising expenditure. We reach more prospective customers through that media than we possibly could for the same dollars through other media. We think we are getting good value, sir.

Mr. PETERS: We compliment you on your choice of programs.

Mr. EMMERT: Thank you.

Mr. MILLIGAN: Where a man is unfortunate enough not to be able to buy machinery, apparently you have a retail finance. What rate of interest do you charge in your financing?

Mr. EMMERT: We charge, I think it would be fair to say, the lowest rate of interest on any consumer commodity. We have a schedule of terms here.

Mr. SNELGROVE: In the case of the retail contract condition of sale, it bears a simple interest of 11.08 per cent. Now, do not pin me down to the .08 or .07, but that is approximately the simple rate of interest charged to the retail customer who finances the purchase of his equipment through our machinery financing institution. This interest rate is competitive within the agricultural implement industry, and certainly is less than the interest charged for the financing of other products, automobile products.

Mr. REGNIER: Is this interest rate you have quoted in vogue in France or in Great Britain, or Canada or the United States?

Mr. SNELGROVE: The interest rate charged in Canada and the United States by our subsidiary is the same rate. This rate also includes insurance, credit life insurance, and a property damage insurance, along the same terms as fire coverage, generally speaking.

Mr. REGNIER: What is the rate charged in Europe?

Mr. SNELGROVE: I do not know.

Mr. EMMERT: May I answer that? As far as I know, we do not offer the same financing facilities outside of North America.

Mr. REGNIER: What would be the total amount of accrued interest charged to farmers? How many million dollars would you get per year from interest rates charged to purchasers of equipment?

Mr. EMMERT: I am afraid I cannot answer that because it depends on a number of factors. One is the amount of outstanding balances, another is how long it is outstanding—that is, the terms and conditions of the specific contracts involved.

Mr. REGNIER: When you make your income tax up, probably you have to provide those figures to find out your profits or your losses.

Mr. EMMERT: Thus far, this year, Mr. Regnier—we hope this is going to change—our Canadian finance company subsidiary, in respect of the tax return that you mention, indicates a loss. We believe this is an accounting matter rather than something that would pertain throughout the year.

Mr. REGNIER: Could you provide us with those figures?

Mr. EMMERT: I am not so sure that we would be prepared to provide as public information such information about a subsidiary, a wholly owned subsidiary.

Mr. REGNIER: You plead the fifth amendment?

Mr. EMMERT: No.

Mr. HORNER (*Acadia*): I have a supplementary question to this. What percentage of your sales in Canada are financed through your own finance organization, or your own finance company?

Mr. EMMERT: We now have a question that I can answer specifically. In 1959, it was 17.2 per cent; in 1960, it was 34.1 per cent; and in 1961 to March 25 it was 33 per cent.

Mr. HORNER (*Acadia*): This is what is financed through these two finance companies that operate?

Mr. EMMERT: This is the percentage of paper that we have taken in relation to the retail sales.

Mr. HORNER (*Jasper-Edson*): You find that banks are not giving out as much under the Farm Implement Loans Act and this is why your subsidiary is doing more business on your sales?

Mr. FORSYTH: I cannot answer that question specifically, but I believe that a large percentage of our credit business comes from customers who have taken up the maximum benefits possible under the F.I.L. act and need additional financial assistance. Certainly there is a large sector of farmers, particularly in eastern Canada who, because they have other employment such as working in a factory, find that their principal source of income is separate from the farm and they cannot qualify under the F.I.L. act. Essex county is a good example of that. I had a check myself there. These purchasers may be a substantial percentage.

Mr. HORNER (*Jasper-Edson*): You cannot break down these percentages as between east and west?

Mr. EMMERT: I do not have those figures. Mr. Chairman, for the benefit of the committee, may I just recite a little bit of our philosophy about this retail time payment with which we are dealing.

Mr. KORCHINSKI: More advertising?

Mr. EMMERT: I beg your pardon.

Mr. KORCHINSKI: I was just wondering whether that was more advertising?

Mr. EMMERT: Our philosophy is quite simple on this. We are not in the business of selling time paper or, I should say, buying it. That is not our intention. It is not our policy, as laid down for the administration of

the finance companies in Canada and the United States. We operate one subsidiary in each of these countries, and we operate them for an identical purpose, namely, to provide our dealers with an additional sales power. We urge our dealers to use the facilities of the F.I.L.A. to the maximum degree. We urge them to use the facilities of their local banks to the maximum degree. Not always is it possible to satisfy the requirements through these sources of money, and in that event we are prepared to consider financing a man's transaction if he meets our requirements. The point is, this is a sales tool. We are not in the finance company business. We had to get into this.

Mr. NASSERDEN: Are the dealers tied into the contract with the farmers so far as the financing is concerned?

Mr. EMMERT: Do you mean, do we kick back to the dealer?

Mr. NASSERDEN: You can look at it this way or the other. If there is a loan, what would be the situation?

Mr. EMMERT: We have several varieties of contract. We have full resource contracts, and contracts running all the way to non-resource contracts. It depends on the saleability and integrity of the dealer as to which plan he signs up with us on.

Mr. NASSERDEN: He is the one who makes the deal.

Mr. EMMERT: Exactly.

Mr. HORNER (*Acadia*): Would you prepare and give to the committee later on a breakdown of the percentage for western and eastern Canada?

Mr. EMMERT: Yes.

Mr. NOBLE: Mr. Chairman, my question is in respect of something which may affect cost in Canada. The statement has been publicized to the effect that what adds materially to the Canadian cost of production is the large management and administrative staff used in our plants in comparison to the same type of plants in Europe. In some cases it is claimed the staff is double and even triple for the same number of employees. I am wondering if this affects the Canadian plants.

Mr. EMMERT: Mr. Noble, that is a fairly general statement. Can you tell me the source of it. What plant are you speaking about?

Mr. NOBLE: I might say that I read an article in *Readers Digest* yesterday in which it was stated that was one of the reasons we could not compete with Europe; we had such an overhang of management and administration which put our costs out of line.

Mr. EMMERT: I would not be in a position to quarrel with this author, but I would need more facts than that to even attempt to reply.

Mr. NOBLE: If you take the last issue, I think you will find the facts are there and that the figures are stated. I did not know I was going to be on this committee today, or I would have had it here.

Mr. EMMERT: I could not deal with it now.

Mr. HORNER (*Acadia*): On page 1 of appendix (E) you state the number of hourly employees you have in Canada and the number of salaried employees you have in Canada. Could you prepare, perhaps for a later meeting if you do not have it available now, figures listing the number of salaried persons five or ten years back and the number of hourly employees employed five or ten years back.

Mr. EMMERT: Mr. Hooper, no—I am sorry—I should know you well enough by now. Certainly our personnel records would lend themselves to the derivation of the figures that you have asked for but, once again, I must say to you it would be absolutely meaningless for the purposes you have in mind.

Mr. KORCHINSKI: Let us worry about that.

Mr. EMMERT: I am afraid I cannot let you worry about that because, if they are meaningless, they are subject to any kind of interpretation anyone could put on them. I would not be prepared to give details of those figures, except in person and with a complete recorded account of whatever transaction occurred in whatever period of time we are talking about. If we take a supervisor from a lower rank which was hourly rated and put him on salary the bare figures just show that as one for one but you see, there is something behind that.

Mr. HORNER (*Acadia*): On that same page, Mr. Emmert, you go on to say that "almost 55 per cent of Massey-Ferguson employees are unionized". Later you state that some of the salaried workers, such as draftsmen, are now covered by a union agreement. Is it a fact that in most instances salaried workers are not unionized and the rate workers are?

Mr. DENTON: Generally speaking, that is a fact. There are unionized salaried people in the industry but I think the majority are not organized. Certainly, in our case, that is so. We have only one organized unit of salaried workers.

Mr. PETERS: Would it be possible to get a breakdown of the amounts of money under hourly rates and salary rates—the total cost per year or whatever would be the easiest to figure out?

Mr. EMMERT: Once again, I would have to give you exactly the same answer I have already given. They would be meaningless without a complete explanation of every transaction within a certain period of time.

Mr. PETERS: It would be very interesting.

Mr. KORCHINSKI: I know they might be meaningless but, if you go back to the charts which we had before us this morning, on one you will find an index for 1947 and you will find one for 1954. You will find that in most cases they started with 1949 but you will also find omissions in the periods with which they deal. This is also the case in your brief. In the first "A" you make reference to 1947 and on page 22 you make reference to 1946 and to 1959 on page 24. I think you go back to the days of the world war, which is all intended to prove a point and this, Mr. Emmert, is exactly what you are trying to suggest will happen if we get a set of figures in that way. Why, in the interests of intelligent study, are we not presented with these figures on a common basis?

Mr. EMMERT: I would suggest, Mr. Korchinski, there is a very valid reason for the beginning of each chart. Mr. Kingsmill, let us take the ones Mr. Korchinski has referred to.

Mr. KORCHINSKI: I was referring to the text. It is confusing when you have 1954, 1957, 1953 and a few omissions, and then you go back to 1946 and 1947 and so on.

Mr. EMMERT: We shall look at this chart, Canadian prices index.

Mr. KINGSMILL: This (indicating) is the base to which the labour section of the brief went back, and so we thought we should take it all the way back to 1947 on the others. That is the place the labour one started from.

Mr. EMMERT: Let us take this one, worldwide net sales.

Mr. KINGSMILL: On that one you have to 1947. The railways were frozen so that particular comparison would begin to get meaningful as an index from 1947 on.

Mr. EMMERT: And, if I may refer to this chart, 1954 was selected because that was the year of the amalgamation of the Massey-Harris and Ferguson companies. Figures were not available prior to that time.

Mr. KORCHINSKI: And yet, in your brief, on page 11 "B" you go back 1952, and you jump to 1954.

Mr. KINGSMILL: We are just updating the Gordon report.

Mr. KORCHINSKI: You go back to 1950; then there is an omission in 1951, 1952, and you jump to 1954.

Mr. KINGSMILL: Everything up to 1954 is merely a copy of the Gordon report, and we have up-dated from there.

Mr. EMMERT: 1936, 1946, 1950 and 1954 figures are those identical figures which appeared in the royal commission inquiry on this industry, and we have used, each year since that time, that equivalent information.

Mr. KORCHINSKI: Then, you have a trend comparison. You refer to an amalgamation, and then you go back to 1949, which was prior to amalgamation.

Mr. EMMERT: In our context?

Mr. KORCHINSKI: I was looking at the chart. I am taking them at random. You can open any page in your brief, and you will find the same thing.

Mr. EMMERT: Oh, well, this is perfectly reasonable. This one deals with North American inventories and customers—accounts receivable—in comparison with sales in North America. We can pick any page you want.

Mr. KORCHINSKI: The point is that you are comparing one year against the next one. You say the labour costs have gone up since 1948 and, all of a sudden you throw in 1949. I submit, in all respect, that in the interest of an intelligent analysis of this we should have a common basis. This is a thing that is confusing, when you start wondering about these things. The very thing you suggest is what is going to confuse the committee, by not having all the available facts before us.

Mr. EMMERT: I thank you for making the point, because you are becoming confused already by this very thing.

Mr. KORCHINSKI: Here is a 1935 comparison on page 2.

Mr. EMMERT: Allow me to state our policy on making up these exhibits. It was to go back as far as there were any meaningful statistics or records available to us. We are quite aware that the longer the trend, the more significant it can be. I think you would agree, Mr. Korchinski, that in all the charts we have looked at here, we do not attempt to compare apples and oranges. We may talk about apples from 1947 onwards, and oranges from 1939 onwards, but we are taking 1947 and 1939 and putting them on the same chart.

Mr. KORCHINSKI: But if we had gone further back we might have found a factor which does not present itself on the chart.

Mr. GUNDLOCK: And, apples still keep the doctor away.

Mr. EMMERT: I am sorry that we cannot go further back.

Mr. PHILLIPS: Mr. Chairman, I have a question I would like to put.

The CHAIRMAN: Is it a supplementary question?

Mr. PHILLIPS: No. Several times today you have spoken about the unsatisfactory profit picture of your company, and, at the same time, a share of Massey-Harris was increased considerably on the market; that is, it has shown a steady rise. To what factor do you attribute that, in view of your unsatisfactory profit?

Mr. EMMERT: Well, Mr. Phillips, I would not presume nor attempt to out-guess the stock market; however, I must point out to you at our annual meeting two years ago a very irate shareholder arose and said to the chairman: "I bought my Massey stock at 16½; what am I to do?" It was then selling at 8.

The chairman responded by saying: "Well, I am very sorry; I cannot help you, but I really do not know many people who paid \$16 $\frac{1}{4}$ for the stock." So, there has been a considerable variation in the share price.

Again, following Mr. Korchinski's line of thought, I think you would have to chart this for a very long period in order to have any significance. As of last Friday, our shares were selling for about 13 $\frac{7}{8}$ ths on the Toronto stock exchange; last year they were as low as 8 $\frac{1}{4}$. For all I know, they may be available at 8, or something less than that next year. I just don't know. I do not know what makes people attracted to any particular shares, or why they bid them up or down.

The CHAIRMAN: Gentlemen, it is now almost five o'clock, but it does not appear that the committee will finish for at least half an hour. We have a meeting scheduled for eight o'clock tonight, so I suggest that we now adjourn.

Here is the list of speakers who wish to ask questions: Messrs. Nasserden, Muir (Lisgar), Clancy, Southam, Jack Horner (Acadia), Pascoe, Thomas, Korchinski and Hales.

Mr. HORNER (Acadia): I would like to move, before we adjourn, while everybody is here, that through due study of this committee we have seen that the profits for the Massey-Ferguson company have declined sharply since 1950, when we would have expected prices to decline as well, but the latter has not been the case. Therefore I move as follows:

That the committee ask Massey-Ferguson to prepare cost figures for the committee, a breakdown of various cost items such as labour, materials, salaries and distribution for a number of years in making a tractor, combine, manure spreader and plough.

In making up these cost figures for a tractor, combine, manure spreader or plough, they may include any other major implement they feel should be included. I so move.

Mr. NASSERDEN: I would like to move an amendment to include all the machine companies, because if we cannot get these answers, a precedent is set right here for all the machine companies that appear before us.

Mr. HORNER (Acadia): I agree with the amendment, but actually we have Massey-Ferguson before us now, and I feel this is definitely a very important point, because if we do not have the costs from Massey-Ferguson, it is quite conceivable that we will not have any cost analysis from any of the other companies. That is why I suggest we have a cost analysis from Massey-Ferguson so that the other companies who will appear before us will produce them too.

Mr. GUNDLOCK: I second the motion.

Mr. MUIR (Lisgar): I would like to point out to the gentlemen present that it is to their benefit as well as to the benefit of the committee, and the reason I say this is that I have here a presentation from the Canadian labour congress. They sent it to me, and I have read it.

The CHAIRMAN: I wonder if you should quote from it, since the Canadian labour congress have not yet appeared.

Mr. MUIR (Lisgar): Their brief breaks down the cost per unit of output. They also break down the distribution and sales dollar. They make the point in the distribution of the sales dollar that 1947 wages amounted to 29.1 cents out of the sales dollar, and that in 1958 this labour cost had been reduced to 16.7 cents.

The CHAIRMAN: We are not dealing with the Canadian congress of labour brief. They had the courtesy to present it to the members of the committee,

but I feel the committee would be out of order in discussing their brief when they have not yet had an opportunity to be here and to discuss it.

Mr. GUNDLOCK: May I make a suggestion? It is simply not ambiguous, and I do not want it to be taken that way in any shape or form.

The CHAIRMAN: I was just referring to the Canadian congress of labour brief.

Mr. GUNDLOCK: Yes, I agree with that, Mr. Chairman.

The CHAIRMAN: I am not objecting to the direction.

Mr. MUIR (*Lisgar*): If you allow me to carry on, I shall be brief. The other brief is going to be brought in, showing the breakdown in the unit cost in the distribution of the sales dollar, which I think could possibly be challenged by the group who are presenting their brief today and I think it is to their advantage, as well as to that of the committee, to have these figures.

Mr. KORCHINSKI: If I may just add to what Mr. Muir has said, I do not want the officials of Massey-Ferguson to think that we are trying to get this information with a view to attempting to condemn them in any way. What we want to do is prove the very point you are trying to make. If you can supply us with this information, and if the situation is as we take it to be, surely there would be no harm done in presenting it to everyone.

Mr. THOMAS: Mr. Chairman, Mr. Horner's motion is a very important one and I think before we take any action on it we should get legal advice from the Department of Justice and should discuss it thoroughly in camera before we go any further with it. I think the motion is full of complications and I fear we are only going to get ourselves tangled up unless we get legal advice.

Mr. HORNER (*Acadia*): Mr. Chairman, a committee has full power to ask for information and in the 1937 report, the most recent study which the house has made, there was a fully documented statement included by each company, John Deere, Massey-Harris, Cockshutt, International Harvester and figures were given showing the exact breakdown of factories, of foundaries, the casting and the rolling mills and everything else. Therefore, I see nothing out of order in this motion.

Mr. McINTOSH: I think Mr. Emmert inferred if he did not say so, that the terms of reference as laid down to the company did not cover the detailing and preparing of the type of information mentioned in the motion. May I ask you, as chairman, do you feel that is correct and, if it is correct, could we go back to the house and ask for a change in the terms of reference?

The CHAIRMAN: Well Mr. McIntosh, may I refer again to the fourth report of the committee of last year. The committee at that time asked that a committee be set up again this year and compile all available facts regarding farm machinery prices.

Mr. GUNDLOCK: Mr. Chairman, we have asked for these facts all afternoon and all we can get is an answer that "it is not referred to in the terms of reference". I asked three questions and that is the answer I got.

Mr. KNOWLES: Could we not consider this better when we come back after the adjournment?

The CHAIRMAN: I move that we adjourn and this question will be on the agenda when we convene at eight o'clock.

Mr. THOMAS: I do so move.

Mr. HORNER (*Acadia*): I think that Mr. Thomas' statement is out of order. However, we can adjourn first and then put down the motion on the records.

EVENING SITTING

MONDAY, May 1, 1961,

The CHAIRMAN: Order, gentlemen. When the committee recessed previous to six o'clock there was a motion before the committee, in respect to our witnesses. The committee dealt with the motion in a somewhat amended form in camera, and I will read the motion now as the committee passed it:

I move, seconded by Mr. Gundlock, that this committee request all machinery companies appearing before this committee to supply for the years from 1954 to date, a cost breakdown of the material, wages, salaries and distribution which go into the manufacture of such items of farm machinery as tractors, combines, manure spreaders, balers.

It is signed by Mr. Jack Horner.

Mr. KORCHINSKI: I think the year 1954 was given in consideration of the fact that Messrs. Massey and Messrs. Ferguson became amalgamated in that year. I did not really think of that at the time, but it has struck me now that in fairness to Massey-Ferguson Limited that is as far as we should go back. Because of the fact that other machinery companies did not amalgamate at that time, I wonder if I could possibly request the committee to go back for ten years from 1960, or to 1949 perhaps—which would be the best year?

Mr. HORNER (*Acadia*): It does not really matter. I think we should leave it to the discretion of the individual companies, if they feel they would like to go back further.

Mr. KORCHINSKI: Could I make a motion, then, or an amending motion, to say "if they possibly can". I am making this statement only in consideration of the fact that Messrs. Massey and Messrs. Ferguson became amalgamated that year. It is only fair to them to ask them to go back to that year, but I think the other companies could supply us with more complete information.

The CHAIRMAN: Would you make that in the form of a suggestion?

Mr. KORCHINSKI: I am making it in the form of an amended motion.

The CHAIRMAN: The motion has been passed. It would have to be a new motion.

Mr. KORCHINSKI: That motion was passed in camera. Is it a fact that the in-camera proceedings are part of our overall proceedings?

The CHAIRMAN: That is correct. You can form a new motion if you wish to do so. What took place in camera was part of our proceedings.

Mr. KORCHINSKI: very well. I misunderstood. I thought this was being brought out now just to put it on the record. Could I make it in the form of a suggestion to the other companies?

The CHAIRMAN: That is what I suggested, that it be made in the form of a suggestion.

I might tell the committee that all the machinery companies will be informed now of this motion which has just been passed.

Mr. MUIR (*Lisgar*): Considering the increase in freight rates over the years, I would like to ask Mr. Emmert, would there be any advantage in shipping component parts from, say, Toronto by the carload and have them assembled, say, in Winnipeg. I mean pricewise about which we are talking.

Mr. EMMERT: I gather that you are really suggesting that we might have assembly points other than in Toronto, Brantford and Detroit, or wherever they exist. This would not be an economic thing in our view. It has been demonstrated in Canada, in the automobile business, for example, that the companies cannot

support more than one assembly plant because of the very high capital costs. The savings that might result from the lower transport cost simply do not offset the cost of the capital. Mr. Childs, have you anything to add?

Mr. CHILDS: I would add that the cost of hauling prime products like steel would be very costly to a point like Winnipeg in comparison with the movement of the finished goods out as we now do.

Mr. MUIR (*Lisgar*): I was not talking about raw steel. I meant where you would make your raw steel into a combine and ship the body parts out. No doubt you could get a great deal more value from your freight than you would by shipping just a whole machine. You might be able to ship out half a dozen machines.

Mr. CHILDS: That is possible, but there is not too much difference at present between the low and the high in respect to rates. It is all one rate. We do not have any incentive minimum rates in Canada, at least to western Canada.

Mr. CLANCY: This is just a question of clarification. In your brief you state that you changed over from a policy of consignment to dealership, in the sense of purchase by the dealer, several years ago. Secondly, that the reason for the changeover was to make the dealer an independent businessman, in other words, he is not receiving a consignment, he is actually signing a contract subject to certain conditions and the vagaries of the industry, to purchase. Thirdly, the incentives that are given to him on discounts, prepaid shipments, and so on, are a straight business incentive. In other words he has to use a certain amount of judgment on his own. I am talking about parts particularly. In the parts field you allow a certain rebate on parts at the end of the year, which is particularly due to the circumstances of your own business. In other words, instead of putting it on consignment, you would try to increase the efficiency of your dealer by making him assume some responsibility. Is that true?

Mr. EMMERT: Mr. Chairman and Mr. Clancy, the word "consignment" as it was used in years gone by—and I hope never to be used again in this industry—really referred to whole goods.

Mr. CLANCY: I appreciate that.

Mr. EMMERT: Our parts policy today is quite a different thing to our whole goods policy.

Mr. CLANCY: What I am trying to get clear in my mind is this. If I buy from you in November and if my business for that line may come in the spring seedling time, by giving you a firm contract in November you are prepared to give me certain advantages—which, I think, is quite legitimate in business. I am a small retailer myself, not a very big one but I do some business. I get certain advantages such as prepaid shipping or a discount of 5 per cent; or I hold a stock for six months, or they give me 60 days or 120 days before my draft is due. In other words, there is an incentive for me to give the company a forward order. I have to take on a certain amount of responsibility after I do that. That is the policy to increase efficiency, as you are trying to put it. There is another question, in regard to parts individually. If I ordered one part in Toronto, there is an f.o.b. ex-factory price on that. In the case of an individual order, there would be an f.o.b. price, and I would have to pay the freight and whatever else is concerned. On the other hand, if I am prepared to start a ledger account, you are prepared to give certain credit terms and use your sales force and your knowledge to give me the cheapest shipping. Is that right?

Mr. EMMERT: Mr. Clancy, we attempt to provide an incentive to our dealers on parts in the form of what we call a stock order. In other words, it is to our benefit to have our dealers order parts in advance of the season, and to be sure that they are at the points of requirement at the right time.

It is to our advantage to have our dealers order parts in sufficient quantity to allow our stockrooms, our central warehouses, to do their work properly.

Therefore if a dealer is prepared to do this, we provide him with an incentive which causes to do this. In other words, he, at that point, assumes some of the cost that we would otherwise have to assume, and we reimburse him for doing it.

At the same time we think this is good business for our customers, because we thereby anticipate by having the parts to distribute out among the customers, rather than in our warehouses where they are no good.

Mr. CLANCY: When you come to your suggested list price, I assume that it is based on the general average of what you know the overhead of the dealer to be. If he does not make a percentage, he will go broke and a bankrupt dealer is no good to you or to anybody else. You have no actual control over that list price, however, and he can get whatever he likes when once he gets it.

Mr. EMMERT: Is that the question?

Mr. CLANCY: That is the question. Your suggested list price is based on an average. Dominion bureau of statistics may say that the basic cost is a certain percentage for every dealer in Canada. There may be an average, and it may vary from one dealer to another according to his efficiency, but three is an average.

Your allowance on your list price, on the mark up, is on an average. But once that is in the hands of the dealer, if he can save through buying a carload lot, it is his business, and no one else's. He can give the farmer a "deal", or he can do with it as he pleases.

Mr. EMMERT: I quite agree with the premise in the latter part of your question, but I cannot agree that our prices are set on the basis of an average cost to a dealer doing business. I must be absolutely truthful. We do not consider that in the parts business. What we have to consider are the very points I have been making all the afternoon. We have to be informed on the parts price, but what the dealers' cost of handling parts is, we have no way of knowing. Averages in that case would be useless. However, with the latter part of your premise I quite agree.

Mr. CLANCY: In other words, you say that your industry has no general survey of costs of doing business among your dealers.

Mr. EMMERT: In respect of parts, which is the subject we are talking about.

Mr. MUIR (*Lisgar*): May I ask a supplementary question to my first question? I would like to ask Mr. Emmert if he finds it advantageous since the opening of the St. Lawrence seaway to ship his combines from Toronto to Fort William by water, and to unload them there as freight?

Mr. EMMERT: Once again I would like to have Mr. Child's reply to this, because it is a question about the advantageous use of the St. Lawrence seaway for ocean shipment.

Mr. CHILD: That is something which just came out recently, with the inauguration of the St. Lawrence Navigation Company which before this year were contract haulers for bulk goods. This year they went into more package freight business. They are coming out to our plant in the latter part of this week to see whether they can physically handle combines and put them down through the hold, or have to carry them on deck as cargo. One deterring factor is the question of planking and stacking once it gets to Fort William or Port Arthur. We have very strong regulations there imposed by the American association of railroads and the Canadian railway authorities in Ottawa that we have to have so many planks, so many tie-downs to

make a load safe for transportation. The cost to us is quite considerable to do that work at the factory, and I cannot see any outside company doing it for less. I think the advantages we might gain in the first instance would be more than eaten up in the cost of reloading at Fort William.

Mr. NASSERDEN: In the brief you made quite a point about the fact that combines are laid down at the same price in western Canada as in the United States. You also mentioned that the cost of labour in the United States is somewhat higher than it is here in Canada.

Does that sort of thing indicate that what you are doing there actually is this: you are not giving anyone in western Canada any particular benefit. That is putting it very crudely.

Mr. EMMERT: No, I would not say it was putting it crudely at all. I do not think we said that the price laid down was the same. I think that we said that the prices at the factory were the same.

Mr. NASSERDEN: Yes.

Mr. EMMERT: And to this you must add your cost either to western Canada or to any point in the United States; and with that you have the laid down cost to balance the fact that we sell at the factory to the dealer in western Canada or to the dealer in the United States at the same price.

Mr. NASSERDEN: I take it from your brief that you feel this is something special which people in western Canada should appreciate. But it seems to me with the increased labour costs in the United States this is not anything special.

Mr. EMMERT: There is another factor which we also pointed out that in respect to freight, it costs us considerably more to ship a combine from Toronto to western Canada than it does from Moline, which is the big center of the industry in the United States, to western Canada.

What we have really done is to exercise the benefit of the lower labour rate in Canada to restrain the price of the combine in western Canada.

Mr. KORCHINSKI: How can you say that if you do not even know what the cost of your labour or transportation is in Canada?

Mr. EMMERT: I did not say that.

Mr. KORCHINSKI: But you have refused to give it to us. Is that not right?

Mr. EMMERT: No.

Mr. CLERMONT: Mr. Chairman, the fact that these gentlemen from Massey-Ferguson will have to come back upon the request of this committee, I move that we adjourn this committee to allow the members of the committee to go to the House of Commons where they are presenting bill 77 an act to provide for the rehabilitation of agriculture lands and the development of rural areas in Canada.

Mr. HORNER (*Acadia*): I would like to speak to that motion before you put the question.

The CHAIRMAN: Is there a seconder?

Mr. HORNER (*Acadia*): Before the question is put I think the committee should first consider whether or not the representatives of Massey-Ferguson who are here before us have a good idea as to what questions we want to put. I have in mind some other questions which, perhaps, they may not be able to answer at this time. Perhaps they would like to have time to work on them, and to bring their answers to us at a later date.

While there may be a bill before the house, we have all had an opportunity to speak on it at the resolution stage. I know I would like to be up there to speak on it myself, but I realize that we have this group before

this committee, and I think we should give them a precise idea as to what we want answers upon, such as costs, wages, transportation, manufacturing, and so on. I think that while we have them before us we should continue with them.

The CHAIRMAN: Does anybody else wish to speak on the motion?

Mr. PETERS: I think it has been very unfair that the agricultural committee should meet at a time when this bill is before the house.

Mr. HORNER (*Acadia*): That is something to take up in the house, and here.

Mr. PETERS: I think it is the fault of those who organized the business in the house.

Mr. KORCHINSKI: Did your whip have any consideration about it with the other whips?

The CHAIRMAN: This meeting was arranged for some three or four weeks ago. We never know what business is coming up in the house when meetings are to be held.

Mr. HORNER (*Jasper-Edson*): All you fellows have had your say.

An HON. MEMBER: The question, please.

Mr. KORCHINSKI: Is it understood that the witness of Massey-Ferguson will appear before this committee at a later date?

Mr. NASSERDEN: I think we should deal with them now, while we have them here.

The CHAIRMAN: Gentlemen, I think the witnesses stated this afternoon that they do not have certain information which you requested, and we requested that in a motion which was passed earlier. No doubt it is going to take the company some time to prepare that information and, undoubtedly, it will be the wish of the committee that they appear here again.

SOME HON. MEMBERS: Yes.

Mr. KORCHINSKI: Is it agreed that they will appear again before the committee? As far as I am concerned, I am not finished with my questioning, and I would like to have their assurance that they would appear again at a later date.

The CHAIRMAN: Are you prepared to come back at a later date?

Mr. EMMERT: Is it proper that I speak while this motion is before the house?

The CHAIRMAN: Well, the question was asked if you would be prepared to come back.

Mr. EMMERT: Of course, the answer to that depends upon the terms of coming back.

Mr. HORNER (*Jasper-Edson*): Your answer is in the motion that was passed.

Mr. EMMERT: We have not had any opportunity to study your motion. I indicated to you earlier this afternoon that our company, when invited to submit a brief here, expressed the view that we would give the fullest co-operation to your objectives. In my view some of the objectives, as they were originally stated to us, were changed a bit and we now need time to review these new objectives after they have been defined. I am not even certain in my own mind what the new definition is. I know some generalities, but I certainly do not know the specifics.

Mr. KORCHINSKI: I think this is highly irregular but, nevertheless, the statement has been made.

It seems to me, Mr. Chairman, that what we want here are answers to substantiate our questions in connection with statements made in the brief. One statement has been a very contentious one, and it has to do with the biggest cost element, being steel, labour, and transportation. We want substantiation for that.

The CHAIRMAN: You are speaking to the motion. I asked Mr. Emmert to answer your question as to whether or not he is coming back. I think we should put the question.

Mr. KORCHINSKI: I am stating that it is highly irregular.

Mr. EMMERT: May I have one more word in reply to your question.

I suggested to you, sir, and to the committee that, when all the briefs that your committee is about to hear have been heard, the entire complexion of this inquiry that you are conducting will be very different. In this sense, the decision that you have taken—your resolution to ask certain witnesses for additional information—I suggest should be deferred until you have the complete content of all the briefs that are going to be submitted to you.

Certainly, I have no desire to stand before this committee and refuse to give you information—not in the least. At the same time, I have no desire to stand before the committee and give you information which would assist our competitors, not all of whom even have been asked to appear before this committee.

Gentlemen, I strongly urge you to await any decision as to what you may want from any witnesses until you find out what you obtain from all the witnesses.

Mr. HENDERSON: Fair enough.

Mr. HORNER (*Acadia*): Mr. Chairman, if we follow that procedure, we would have to hear every witness of every machine company twice and, while the session may drag out quite a while, I do not think it will last that long.

Mr. HORNER (*Jasper-Edson*): Mr. Chairman, in speaking to the motion that we adjourn, I disagree with it, and speak against it. We had an opportunity to speak to the resolution, and those of us who want to speak on the bill can be there. We have passed a motion in the committee tonight that we ask the machine companies to provide us with certain information with regard to the cost and, with all due deference to the vice-president of Massey-Ferguson, the question of price of any product has to be investigated in conjunction with the cost of that product. They have outlined in the brief three areas in which they feel they do not have the control which they might like to have of these particular costs. I refer to their labour costs, their transportation and material costs.

We had asked particularly and specifically this afternoon with regard to their labour costs. Now, this is the sum and substance of a number of questions we have asked. We have asked what and how much has labour cost increased in the price of farm machinery; what and how much does labour contribute to the price of farm machinery. This is what we want to know, in essence, Mr. Chairman, and with all due deference to the vice-president, we feel this is rightfully within our terms of reference.

There are a number of further questions to be asked, and if he wants to take these and discuss them with his management group, then, fine and dandy; we will agree with that. On the other hand, there are other questions outside and inside the labour group to be asked.

Mr. CLERMONT: Mr. Chairman, this has nothing whatever to do with the motion.

Mr. HORNER (*Jasper-Edson*): If my friend will allow me to finish, I would like to say that I have several questions I have been waiting patiently to ask

through the vice-president to the gentleman who is in charge of their traffic. I should like to ask these questions on freight rates which, I suggest, sir, is—

The CHAIRMAN: If I may interrupt. Dr. Horner, would you confine your remarks to the motion?

Mr. HORNER (*Jasper-Edson*): I am suggesting these reasons, Mr. Chairman, for being against the motion. I have these questions I would like to ask tonight—not next week, but tonight—so that if they do not have all the answers, or all the facts, they will be in the position of at least knowing the questions. Then, at a later time, they can produce the information.

Mr. Chairman, this is essentially my opposition to the motion as proposed. I am sure that other members of the committee have other questions to ask. We do not expect that these officials be supermen, but I say that if we ask these questions, and if they are reasonable ones, they could supply an answer for them. Perhaps they could not do it tonight but, if not, they could do it at a later date. I think that the questions should be put at least tonight. These are the reasons why I am opposed to the motion as proposed by the hon. member.

The CHAIRMAN: Is the committee ready for the question?

Some Hon. MEMBERS: The question, please.

The CHAIRMAN: It has been moved by Mr. Clermont, and seconded by Mr. Regnier, that this committee be adjourned, to allow the members of this committee to be in the House of Commons where they are studying bill 77. All those in favour of the motion? All those against it? I declare the motion lost.

Mr. Nasserden, were you finished with your questions before the motion was proposed?

Mr. NASSERDEN: Mr. Chairman, I have been sidetracked for a moment by this motion. However, if given the opportunity later on, I would like to ask further questions.

The CHAIRMAN: Then, we will proceed to Mr. Southam.

Mr. SOUTHAM: Mr. Chairman, my question is based on a general observation of part A of the brief, prices, and financial expenditures. During the testimony of a former witness before this committee, he was interested in some statements and deductions made by a certain body in the United States, dealing with cost factors in the price of farm machinery. The observations fall under the following headings: administered prices, planned obsolescence, non-standardization of component parts and the superfluous gadgets that are put on machinery. What I am concerned with, Mr. Chairman, is his reference to administered prices, and this is what he had to say:

The rising price of farm machinery has, on the one hand, come as a result of the application of an administered price by the industry, and on the other hand as a result of a market price as applied to the sale of farm products.

This, I may add, was testimony given before chairman Estes Kefauver of the subcommittee on anti-trust and monopoly of the United States senate.

Mr. PETERS: May I ask, what is the hon. member reading from?

Mr. SOUTHAM: It is, as I said, part of a reference made by a former witness who represented the national farmers union and it has given me a certain amount of concern. This is what was stated by chairman Estes Kefauver during that testimony.

With the passage of time, administered prices have become more and more important in our economy. This has been partly due to the changing composition of the country from a predominantly agricultural to a predominantly industrial economy.

The words "administered prices" were apparently originated by a doctor Gardiner C. Means, an economist for the United States government committee for economic development. He originated the term and his definition of it was:

On my definition an administered price is a price set by someone, usually a producer or seller, and kept constant for a period of time for a series of transactions. The opposite of an administered price is a market price—a price that fluctuates on the basis of supply and demand as these forces are felt in the market.

That, to me, seemed like a new economic criteria which has been introduced into business during the last few years. Would Mr. Emmert care to comment on it? Do you agree with these assertions, in part or in whole?

Mr. EMMERT: I am afraid I am not just qualified to comment on anything given in testimony before Senator Kefauver. I have already covered the question this afternoon that, so far as any price fixing is concerned, there is none in our industry. So far as the definition of "administered prices" is concerned, I would have to inform you that there are no such at the retail level because, as we have already pointed out, the prices paid by the customer is altogether a matter between the dealer and the customer. We have nothing to do with that, except to set the suggested maximum retail price.

Mr. SOUTHAM: I am glad to hear you say that, Mr. Emmert, because this former witness used these words and I was wondering was this a new economic criteria coming into general business operations.

Mr. KORCHINSKI: Before this agreement in 1944, where previously the dealers were given machinery on a consignment basis, was there a different type of arrangement in that you had a direct say in the price charged to the consumer?

Mr. EMMERT: I am not just qualified to answer that question. I was not in the industry at that time. Can you, Bill?

Mr. FORSYTH: Mr. Chairman, you said pre-1944?

Mr. KORCHINSKI: Was not that the year the other arrangement was made?

Mr. FORSYTH: I think it was 1945, but you are suggesting that has a relationship as to how a business would possibly go as a dealer component. No, at that time an agent—pardon me, I shall start it the other way and say that all of the inventories in our agencies were owned by the company and could be transferred at the company's will. In fact, the inventory was only in the care of the agent. There was a suggested list price. I am not sure of the law at that time but I suppose world war emergencies applied in those years, but this went back to the 1930's. The agent, if he took a trade-in, was responsible to the company for reimbursement to the value of that trade-in and, once a year or more, the agent collected his commission. As far as our company, and probably any other company was concerned, in that they could actually dictate that a dealer was to get \$7.7 for a machine, or whatever the price was,—that was solely up to the agent. If he sold it for less—

Mr. KORCHINSKI: But there must have been a recovery price, as you call it.

Mr. FORSYTH: Very much so. In addition, if we wanted \$100 for a machine and an agent sold it for \$75 retail, then he owed us \$25.

Mr. KORCHINSKI: In other words, there was a recovery price which might be comparable to the present recovery price. There must have been some difference?

Mr. FORSYTH: Yes, it was entirely different in the structure.

Mr. KORCHINSKI: What price did you charge and what price did the agent have to pay for that machinery?

Mr. FORSYTH: Actually, he remitted the entire settlement. If a machine was sold for \$100, be it cash, trade-in or credit and cash, the agent remitted the entire settlement under those circumstances to the company.

Mr. KORCHINSKI: But, if he were able to procure \$150 did he remit \$150 to the company?

Mr. FORSYTH: I would say theoretically that is right but I do not think in practice it ever happened. I have never experienced it.

Mr. KORCHINSKI: But in theory that was the practice?

Mr. FORSYTH: In theory that possibly would have been the practice, but I do not think it happened. If it did, the agent never submitted more than the list price; but the point I want to make is that there was a fixed rate of commission subject to settlement being made accurately and promptly and the trade-in, if a trade-in was involved, being settled promptly and accurately. Generally speaking, this commission account became once a year and it was commonly referred to in the trade as "settlement date".

Mr. KORCHINSKI: There is no such thing as commission for an agent at the present time?

Mr. FORSYTH: Not in our company.

Mr. SOUTHAM: However, if an agent sells so many pieces of equipment this year does he not get two per cent, or something like that—

Mr. FORSYTH: We would not refer to that in the terms of commission.

Mr. KORCHINSKI: How would you refer to that type of arrangement?

Mr. FORSYTH: That would be a special incentive of the type we have outlined.

Mr. KORCHINSKI: Are there any other types of incentives?

Mr. HORNER (*Acadia*): Interest free for six months.

Mr. KORCHINSKI: If, for instance, a dealer sells certain equipment in September is there any special incentive for that?

Mr. FORSYTH: That, again, is another type of incentive. As a matter of fact, we had a program this year for early orders on, I think it was combines, where we waived the time payment differential to some period in 1961; but this was to the customer, to the retail customer and I believe we paid interest on monies he paid in at that time. That was another form of incentive.

Mr. KORCHINSKI: Has this shifted the responsibility from your company to the dealer in regard to the overall price of farm machinery?

Mr. FORSYTH: I could not say it had or had not. I would think, overall, it had not. One of the examples I would quote to you would be that under the agency structure, if they were operating on consignment, they were responsible for the field services to agents. With the growth in the industry that would have required a core of trained men which becomes impossible, let alone economic. This cost the company a lot of money and the dealer actually absorbs it in his own operating costs now. I do not think it would vary the price to any material degree, one way or another.

Mr. KORCHINSKI: A lot of farmers have so-called experts coming around after machinery has been sold to them. Is that the responsibility of the dealer or of the manufacturer, to provide that type of service? It is extra mechanical service.

Mr. FORSYTH: You are suggesting, Mr. Korchinski, where a dealer has attempted to service a machine and has been unsuccessful, and he calls for help to the parent company?

Mr. KORCHINSKI: Yes.

Mr. FORSYTH: It is a responsibility of the management to have competent people to instruct the dealer on service procedure and principles. This so-called expert you speak of would be of that category.

Mr. KORCHINSKI: That is what I thought.

Mr. SOUTHAM: This is a follow-up to my previous question. Several factors were mentioned at former hearings, and one of these was that certain types of industries have been accused of planned obsolescence. I should like to ask the witnesses if there is anything like that in the farm machinery industry—planned obsolescence which would increase the cost of the machinery?

Mr. EMMERT: I think we can dispose of that one quite promptly. The term "planned obsolescence" was generated from the automobile industry with the annual model change. It has since carried over into such items as household equipment, refrigerators, stoves and so on. It is certainly not practical in the farm equipment industry. We have no intention of practising it in the context that the automobile people are alleged to practise it. That is the simple answer.

Mr. SOUTHAM: Personally I am not suggesting you did. I only thought it was a good time to bring the question up, as it was hinted at earlier.

Another thing that was mentioned at the same time, I think, as you mentioned the automobile industry, this is the competition between different companies in the planning of frills, gadgets that are superfluous and that would increase the cost. What is your attitude on that? Do you find that a factor in competition in the machine industry?

Mr. EMMERT: I would find it very difficult, Mr. Southam, to categorize any feature on any one of our machines as a frill.

Mr. KORCHINSKI: A cigarette lighter?

Mr. EMMERT: That is a convenience because we find people are willing to pay for it. They insist on smoking on a tractor and they cannot light a cigarette without a cigarette lighter. You might categorize foam rubber seats as a frill; personally I would not, as I do not want to sit on a tractor for ten or twelve hours on an iron seat. You might categorize a tachometer as a frill; I do not consider it that, it is a basic tool.

Mr. KORCHINSKI: Fenders?

Mr. EMMERT: I do not consider fenders a frill.

Mr. KORCHINSKI: Why are they not standard equipment? I am probably dealing with the wrong company; I know companies that do not provide them.

Mr. PASCOE: Mr. Chairman, I had a question this afternoon but the point was passed over before I had the opportunity to speak. In view of the motion passed here a while ago asking for more details on the cost factor of production, perhaps I should defer it. I will ask it anyway to indicate what line of questioning we might have at a later hearing. I took some notes this afternoon, and Mr. Emmert said—or I thought he said—that the productivity per man hour in a company's factories has not increased in line with the increases in hourly wages. I imagine this statement will be disputed by witnesses at later hearings. I would like to ask Mr. Emmert if there are any charges or figures in this brief to support his statement, and if we could look at those for a while, if there are such charts.

Mr. EMMERT: Mr. Pascoe, you are quite right; I did say that productivity had not increased in direct ratio to the increase in the wage which you saw here. I am not aware of any specific charts dealing with that particular matter largely for the reasons that I have been giving the committee all afternoon—that is, you have to have a constant article before you can accurately portray for the committee what has really happened to productivity in relation to wages.

Mr. PASCOE: But it is still your opinion?

Mr. EMMERT: It is still my opinion that it has lagged behind wage increases.

Mr. PETERS: On this particular question, could I ask the vice chairman whether any of your plants have what you call in the steel industry C.W.S. or a formal increment wage study?

Mr. EMMERT: You are referring to the incentive wage system?

Mr. PETERS: No, a work unit measurement. Your increment for various categories is based on it—so many points for this or that on a formal basis, so that you would be able to relate productivity to the actual wage factor.

Mr. EMMERT: Mr. Peters, we have several ways of paying our people. I would like Mr. Denton to describe the three formal methods of payment, all of which refer to the measurement of work.

Mr. PETERS: Is the witness familiar with C.W.S. used in steel plants?

Mr. DENTON: We have no plan comparable to that. That is an evaluated plan that is not, to my knowledge, based on productivity. I may be wrong but we have not got that type of plan. We have three systems of payment: an incentive plan in which your earnings increase according to the effort you put into your work with a minimum base guaranteed rate. We have what we term a measured day work plan in which you have a guaranteed day work rate, and we expect a certain output; and then you have a straight day work type plan which would be for toolmarkers and other labour that you cannot readily measure. There are therefore three types of plans, and none of them are comparable, really, to the type of measurement you indicated.

Mr. EMMERT: Mr. Peters, you are on to a very interesting subject here, from our point of view. I gather, from reading something about the committee members, that there are a number of employers on the committee, either in term of farmers, industrialists or businessmen. Is it the experience of any of the members of the committee that the productivity of their workers has improved commensurate with wage increases they have had to grant?

Mr. PETERS: Just as an example—it may be a joke and all that.

Mr. EMMERT: It is no joke.

Mr. PETERS: Take for instance the hired man on a farm. We used to have four or five hired men and now one hired man and a farmer can do the same work on milking machines where it was impossible for them to do it by hand, while wages have gone up. I think it could be assessed how much more money was being paid to hired help on the farm in comparison to what it was in those years when they milked by hand. I think the milking machine and the stable cleaner has made it possible for one hired man to clean the stables for that number of people. We are only dealing with those employers who are farmers. I think there is not a farmer here who will not agree that there is a relationship between productivity of his hired men and the wages he pays them. This was maybe a facetious remark in the first place, but I know that on the farm we have at home, my father and brother, since they put in a stable cleaner and have milking machines and other assets where they used to use three hired men and sometimes more, and also the farm equipment they now use, they very seldom have more than one boy working on the farm in the summer. There is only one hired man. Fifteen or 20 years ago we used to have two or three and sometimes more men. So while it is true that the wages are three times as high as they were then—

Mr. HENDERSON: Five times as high.

Mr. PETERS: We used to pay good wages on the dairy farm. There is a relationship, and I would be surprised if there was not some method of ascertaining the relationship in plants. Now the bonus system which you are talking about in two of the plants you have, would be an indication that you

are increasing your productivity or your bonus system and your wage increase would disappear because you still know what your unit of work is and you know the wage you are paying, the total volume of units. Anything you pay over that is a bonus system actually, which is an incentive. You can ascertain quite easily whether you are getting some type of increased production. It may not be directly proportionate but I would suggest there is some kind of relationship.

The CHAIRMAN: I hope the supplementary questions will not develop into full length speeches.

Mr. HORNER (*Acadia*): Is it a statement or a question?

Mr. PETERS: It is an important factor, if you are going to talk about wages and productivity.

Mr. EMMERT: Mr. Chairman, I have a brief comment in response to Mr. Peters' very lucid, I thought, statement. You have made the point perfectly, Mr. Peters, that in order to improve the productivity of your hired man you had to make a capital investment. I submit that our industry has not made enough money to allow us to make the capital investment to obtain the productivity gains that we might otherwise have had. I know perfectly well, standing here tonight, how to increase the productivity of Massey-Ferguson Limited—that is, to replace all of our Canadian plants. I do not mean to replace them out of the country but to replace them, build new ones. We do not have the funds to do it.

The second point you made—and I thought very well—was that none of this improved productivity on our bonus system, or any other system, necessarily comes from increased effort on the part of the individual. This is why we have a bonus incentive system in an attempt to incite people to work a little harder than the standard. This is the only reason.

Mr. KORCHINSKI: Have you had a reduction in staff since 1954?

Mr. EMMERT: Since 1954? I will ask Mr. Denton.

Mr. DENTON: I have not got the figures available.

Mr. EMMERT: It would be almost dependent on whether our production was up or down.

Mr. NASSERDEN: I have a supplementary question; I was wondering whether there was any possibility that the high prices of repair parts had become an inducement to encourage the sales of new machinery.

Mr. EMMERT: I am afraid I will have to ask to have it rephrased.

Mr. NASSERDEN: I was wondering whether you thought there was any possibility that the high prices of repair parts had become an inducement to encourage sales of new implements.

Mr. EMMERT: First of all, as you know perfectly well from this afternoon, I take strong objection to the word "high". Secondly, I really do not know how I can answer that question. If the price of spare parts is considered to be too high, then the first alternative of the customer is to buy a different brand of machine where he believes he will do without spare parts or where he thinks he can buy spare parts at a lower price. I cannot quite tie the two together.

Mr. MUIR (*Lisgar*): Of course he was speaking of the whole industry, I mean that there would be no point in turning to new machinery if we are all in the same position.

Mr. KORCHINSKI: You also suggested that your prices are comparable, with little variation, to other prices of machinery, so that wherever I go I am out of business or else I am prepared to pay for that piece of equipment.

Mr. NASSERDEN: You said this afternoon your price is set by your competitor.

Mr. EMMERT: I do not think I quite said that, sir. I said that our price was established by the market and demand.

Mr. KORCHINSKI: But it has got to be competitive.

Mr. EMMERT: How many questions are we dealing with?

Mr. KORCHINSKI: Is it competitive or is it not?

Mr. EMMERT: Am I speaking with you or with the other man?

Mr. KORCHINSKI: If you do not want to answer, you do not have to.

The CHAIRMAN: I will ask the committee to address their questions to the chair.

Mr. HORNER (*Acadia*): May I proceed with the question I was going to ask?

Mr. PETERS: Before you leave this, could I ask what you do with your parts after you have set up and you finish the machine, you are finished with the model entirely and I presume you made parts for a number of years to come—or do you do this? Do you farm out parts at all to jobbers by giving them your casting molds, and that sort of thing, or do you control your parts at all times?

Mr. EMMERT: Mr. Peters, there are several categories of parts: one, the kind of parts that come of production tooling. In that case it is obvious we retain tooling to produce production parts, and we attempt, to the best of our ability, to run parts requirements at the same time as we are running production requirements. The second category is in respect of tools that have become passé on production equipment. We retain those tools, and as parts are required we attempt to run the most economical number in view of the past sales and future prospective requirements. We have many, many thousands of tools in our plants simply stored. We are continually in the process of serving those tools to determine whether it would be best to make a lifetime of parts and scrap the tools, save the cost of storage and generate the scrap value of tools, or whether we must retain the tools.

The second part of your question was whether we ever attempted to job out these parts. We would be delighted to do so on these short-run parts. Unfortunately, we cannot find anyone who will take on the business. We have an obligation, so we have no choice.

Mr. NASSERDEN: I believe the witness was on the point of answering my question.

Mr. KORCHINSKI: I interrupted when Mr. Nasserden asked his question.

Mr. NASSERDEN: The witness appeared to be ready to answer.

The CHAIRMAN: I want to be fair to all the members of the committee, but some members have not had an opportunity to make any comments this morning or this afternoon. They have been waiting for some time to make that comment. I hope the committee will recognize some of the members who have not had an opportunity.

Mr. NASSERDEN: If I do not get this question answered now, I will have to ask it later.

The CHAIRMAN: I recognize Mr. Horner.

Mr. HORNER (*Acadia*): My question dealt with manufacturing. We have all agreed that in order to study prices of farm machinery we must look at manufacturing. On page 3 of part (B) of the brief you outline Canadian manufacturing and what percentage of the American market this captures and what percentage of the Canadian market it captures. The total manufactured in Canada is, I understand, in that chart on page 3, \$91 million. I wonder if Mr. Emmert could prepare, or perhaps he has the figure here,

a statement showing this figure. We know their sales for 1960 are \$490 million. What I would like to know is where those sales are manufactured. We see \$91 million manufactured in Canada. In their annual report last year I see \$126 million were manufactured in the United Kingdom. I would like to see a breakdown of the \$490 million—where are they manufactured?

Mr. EMMERT: By country of origin? I do not have those figures but they can be prepared.

Mr. HORNER (*Acadia*): You will make an endeavour to prepare them?

I have another question that, perhaps, may be brought back at another meeting. I asked this earlier on in the evening, and I want to put it again, with regard to the number of employees. I realize there are 35,000 employees with Massey-Ferguson, and perhaps 9,000 in the North American continent. In appendix E they list the numbers employed, the numbers of hourly workers employed in the United States and the number of salaried workers. In order to study the cost appraisal we should have a breakdown, perhaps for a later date, of the number of hourly employees and how this has varied in the past years, and the number of salaried employees and how this has varied over the past years in Canada, in the United States if you wish, and in Massey-Harris generally; and the payroll costs on each.

Mr. EMMERT: Mr. Horner, I was delighted to accede to your request about the country of origin. That is straightforward and simple, and for whatever purpose you have in mind, we are delighted to furnish it. This new request I cannot comply with. The material is simply not available in the form in which you have asked for it.

Mr. HORNER (*Acadia*): I find that hard to believe. I do not mean to be facetious or anything like that, but you must know how many men are employed. You have listed in your annual report 35,000 employees with the company. In a sense, I would wonder how many of those are hourly employees and how many are salary employees.

Mr. EMMERT: Mr. Horner, the traditions of industry vary from country to country. We all know that what is an hourly rate man in North America may or may not be so in some other country. We have companies all over the world who have nothing but salary people. We have right here in North America an example, where Mr. Forsyth in his branches has salary people at work. In the United States branches they are hourly rated people.

Mr. HORNER (*Acadia*): Could I break it down?

Mr. EMMERT: So this is the apples and the oranges?

Mr. HORNER (*Acadia*): What number of employees are actually engaged in production, distribution and administration? Could I have a breakdown of your employees in that regard over the years? What I am trying to get at is this, has the cost of machinery gone up because machine companies are over-administrated to an extent—This is a term the farmers like to accuse them of—or is it because the production workers have increased their wages very much so that they are the culprit, or is it because of excessive and outdated distribution methods? It was suggested by an engineering firm, in the Woods and Gordon report, that distribution methods were out of date up until 1944? This is mentioned in the Woods and Gordon report. The only way we can see into it is by knowing the number of persons employed. We know your sales have increased. We must take every relative factor, of course. If we had an idea as to the number of men employed in administration, the number of men employed in distribution and the number of men actually employed in production, we would then have an idea as to which is outweighing the other to some extent.

Mr. EMMERT: Mr. Horner, I suggest—and again with all due deference to a committee member—that you would have actually no more idea than you have now. Our definition of distribution may or may not coincide with a competitor's; our definition of direct labour may or may not coincide; our definition of indirect labour may not coincide. We change it from year to year.

Mr. HORNER (*Acadia*): I realize that, Mr. Emmert, but if you felt that your definition of production labour or distribution labour would not be interpreted rightly, you would be well advised to table a definition of each of these labours and this would be brought in with the table. Everybody would have it there for their own reference and we could judge it accordingly.

Mr. EMMERT: And after the judging, then?

Mr. HORNER (*Acadia*): We have to come out to a conclusion. We have to bring in some recommendation.

Mr. KORCHINSKI: This is a supplementary question. How do you arrive at an hourly rate, then, if you do not know?

Mr. EMMERT: By the people paid by the hour, sir, as opposed to those paid by the month.

Mr. KORCHINSKI: That is the salaried employee. Therefore you know what your salaried employees are getting per hour. You have to know because you have to divide into something to get an hourly rate.

Mr. EMMERT: We know how much goes out and we know how many salaried people there are and what they are being paid.

Mr. KORCHINSKI: Therefore we can get the salaried ones?

Mr. EMMERT: I did not say you could get it. I said we knew.

Mr. HORNER (*Acadia*): In order to bring this to a head I would so move, that we have all machinery companies before this committee produce the number of their employees over the past few years contributing to administration, distribution and actual production. If the machine companies wish to bring this information before us with their own definition of these categories, it is their privilege and we hope they would do so so that we would not misinterpret their figures. Must I write that down?

The CHAIRMAN: It will have to be in written form.

Mr. EMMERT: Mr. Chairman, I am really quite distressed at the track this inquiry is taking. We came down here to Ottawa with what we considered to be a thoughtful, honest, comprehensive brief in accordance with the terms of reference that were sent to us in the original letter. This apparently is not the case. Our brief is not accepted in the context that we have delivered it. We have said to the committee that the elements of cost that have increased include our labour, we have demonstrated the increase per hour of labour. Now we are asked how many hours of labour are used. This is a different thing. We have demonstrated to the committee that the material—I am referring particularly to steel—has increased exactly by what percentage; and now we are asked how much steel is used.

We have demonstrated to the committee that transportation has increased in cost, yet that apparently is not satisfactory. Now, at this point I must admit to being rather confused as to why we are here. I thought we were here in accordance with the original letter. But this, apparently, is not the case.

I do not think it is appropriate that we could be expected to have answers to a number of questions that have been raised. I do not think it is appropriate that we should be expected to answer some of the questions that have been raised, because it is competitive information that you are asking for.

I suggest once more that the committee would be well advised to hear the balance of the briefs and assimilate all the information that will be willingly given by all the parties to your hearings, and then, if you do not have all the information you want, you may continue the hearings. I have said to you that we will co-operate to the best of our ability. I just do not know what else we could say at this point.

The CHAIRMAN: Might I add a word here. I think in all fairness to Massey-Ferguson and to the other implement companies which will be appearing before us, it is my personal feeling that I do not think it is the desire of the committee that we should delve for or seek out information and bring it from any company before us, that is, information which would be of value to a competitive company.

Mr. HORNER (*Acadia*): I do not want to put Massey-Ferguson on the spot. The Lord knows I have more Massey-Ferguson implements on my farm than any other members of this committee.

Mr. FANE: You say you have more than I have?

Mr. HORNER (*Acadia*): Yes. But I do not want to put Massey-Ferguson in a poor position competitor-wise vis-a-vis their competitors. And in asking for the number of employees they have in distribution, for example, I fail to see why they would be put in an inferior position competitor-wise.

Mr. EMMERT: I would be perfectly prepared to give you the number of employee categories in any way you would like to have them, as of any given date; but I am not prepared to give you the category of employees over the years without a specific and explicit explanation as to the movement of employees, and, in that regard, we cannot do it. We cannot do it because we do not have the records to substantiate the movement of people from one job to another in our company. I certainly could not commit, under any circumstances our Indian company, our South African company, our French company, and our Great Britain company to do that. In the first place, we have only had a Great Britain company for a year. Prior to that it was Standard Motors.

Mr. HORNER (*Acadia*): I realize that. And I realize what I am trying to get at is not an exact figure. If they laid off a man yesterday, that is fine with me. What I am trying to get at is the amount of men employed in distribution, the amount of men employed, just roughly, or approximately.

The CHAIRMAN: Are you using "amount" or the number of persons?

Mr. HORNER (*Acadia*): Well, number means the same as amount, when you are talking about persons employed. I want the number of employees with regard to distribution. We have evidence in the brief that the whole distribution system was revamped after 1944, and that the number of employees in distribution was automatically reduced after that time. This is in the brief, and I can give you the page, if you give me time to look it up.

I want to know how this has affected the production of their machinery, and the amount of people actually employed in production. I think we should try to find the relative per cent with other companies which present briefs before us, as to whether or not in common there is here a lower policy than some of the other companies. We have every right to wonder about the same matter in regard to machine companies. Again, I want to make sure that the committee understands that I have nothing—that I have no axe to grind, particularly in the case of Massey-Ferguson or anyone else. I think their machines are wonderful. That is why I have so many of them.

Mr. PETERS: Would this be agreeable to the vice president.

Mr. HORNER (*Acadia*): Mr. Chairman, there is a motion before the committee.

Mr. PETERS: It seems to me that we should not be too interested in whether you have 2,000 employees in your Canadian plant, or what the actual number is, and exactly what salaried employees you have, or what staff there is among your demonstrators. Could it not be broken down on a percentage basis including the salaries, on some type of basis which would do for our purpose, I imagine, and you could give us the type of information that we are interested in without meeting the objection you would have in using actual terms, and bringing it down to actual dollars and cents.

If the relationship was worked out on a percentage basis, this would indicate to us whether we thought your company was top-heavy, without you being placed in a position of admitting exactly whether it was to-heavy or not.

In other words, if the salaried employess were 75 per cent, and the production employees were 25 per cent, I would assume it was top-heavy. I do not think it would really matter to me what the exact figures were. It could be worked out on a percentage basis, rather than bringing it down to dollars and cents. I can see where there would be some objections, from a competitive position, in reducing it to that level. Would this be part of the objective?

Mr. EMMERT: Mr. Peters, what you really are suggesting is that the committee inquire into the internal affairs of the companies engaged in the farm equipment industry. This is really the suggestion that Mr. Horner and you are making. I do not believe that the terms of reference that we came here on have anything to do with that.

We have demonstrated to you that the prices of farm equipment bear a reasonable relationship to their constituents of major cost—maybe labour and material. Any figures you might derive in respect to salary payrolls, distribution payrolls, hourly rate payrolls, I tell you, as truthfully as I can, would be completely meaningless. They could not be compared as between companies. They demonstrate nothing. I would be prepared to bet the money I have in my pocket, which is not very much—so, if you want to take the bet, do so—that the company itself cannot agree on a definition of a man engaged in distribution. I know it is an impossibility.

I will go further and tell you that the eight Massey-Ferguson men here before you today cannot agree, either. I could claim to Mr. Forsyth, under certain circumstances, that his service men that he has out in the field are distribution people, and that they should be charged into that account; he will argue with me.

I could claim that a stock man in a branch is a distribution man, and maybe he is or maybe he is not; the only man in our organization that we could have complete agreement on as to whether he is chargeable to distribution or not, is the distribution clerk. We have one in Mr. Forsyth's organization—one.

Mr. HORNER (*Acadia*): Would you like to break it down into only three categories?

Mr. EMMERT: I would not like to break it down into any categories.

Mr. NASSERDEN: On a point of order, Mr. Chairman—and it has not anything particularly to do with the last remarks made by the witness—we have heard today, on several occasions, when questions have been asked, the assertion that it would not mean anything to this committee. I think we are

the ones to decide whether it will mean anything, or not, to us. We will not know until we hear some of this information, whether it means anything to us, or not. While in explanation it is all right to offer that as part of the answer, when we hear it time after time it tries the patience of members of this committee. From that standpoint, I would like to say this. Speaking from that standpoint, I should like to say in regard to the price of farm machinery that costs certainly enter into those prices and, if we are to go along with the generalities included in your brief here today, we shall not get down to the meat of the matter that we have been given to discuss and inquire into. So far as I can see we have wasted our time, unless we can get some specific answers to some of the questions that have been asked.

The CHAIRMAN: Mr. Muir, do you wish to speak to the motion?

Mr. MUIR (*Lisgar*): Yes. I am inclined to agree with Mr. Emmert on this particular phase in that, if we get the information we asked for in our previous motion, then this other information which we are now discussing is not really relevant. I think there is a limit to which we can go in investigating private enterprise, in that the witnesses have to be competitive with other companies within the industry. Therefore, I think if in all honesty they give us the information that we required in the previous motion, that should give us the information we need as regards costs.

Mr. KORCHINSKI: Mr. Chairman, when I first got this brief I read it with diligence and studied it closely. I was under the impression it gave us a lot of information. The first statement in it reads like this:

When Massey-Ferguson was invited to submit a brief to the standing committee on agriculture and colonization, our board of directors agreed at once to give full cooperation to your objectives.

Now, our objectives are what? They are that the standing committee on agriculture and colonization be empowered to inquire into the prices of farm machinery and report to the house thereon.

On page 5 of their brief Massey-Ferguson state that their biggest cost factors are steel, labour and transportation. I took the words on page one at face value, and I expected we would get that co-operation. I mean no disrespect but I thought that was important if we were to delve into the prices of farm machinery. Unless we are prepared to admit that costs, such as steel, labour and transportation, are not factors in determining the prices of farm machinery, then we might as well forget them.

Later, in their brief, they mentioned that their profit on sales in 1960 was 2.3 per cent. They have also suggested, on page 4, that the prices charged for their products have not covered costs and provided a fair capital return. In all fairness, I want to bring out the facts behind every statement, and the questions I have asked were in order put the company's position as clearly as possible before the public. I think my people back home expect me to get the facts for them, and it is with that intention we required into every phase of their business.

If there was a type of question which was unfair to ask because their competitors should not hear it, I would have preferred had we been told so and we would have dropped that line of questioning. I tried to drop such a line of questioning myself, which I thought might not be fair, and had we been told this we would have been in a far better position to ascertain what was in the witnesses' minds. I merely place this on the record, because I think we are just running up against a brick wall, both of us having the intention of proving the same thing.

Mr. MILLIGAN: I do not know, Mr. Chairman, if you have had a seconder to the motion, but I should like to second Mr. Horner's motion. I probably would not go so far, except that Mr. Emmert is drawing us out. For instance, Massey-Ferguson have a factory in Toronto which is producing only combines, and surely they could give us a breakdown of the labour costs in making those combines there? I do not think we are concerned about labour costs in foreign countries, but surely the company should be able to give us the costs for the manufacture of one particular machine, centralized in one particular place? I also think we should be able to get some return on sales promotion. Surely the witnesses have a figure on that and also on costs of administration? I believe it would satisfy the committee if we had a rough idea so that I, when I buy a combine, would know the percentage of cost I am paying for labour, for steel, transportation and all the rest of it. I would not want the witnesses to go so far as divulging something which might put them in an awkward position with other companies, but I think we should get this information from all the companies.

The CHAIRMAN: I might suggest to the committee that the original motion, passed earlier in the proceedings, was much stronger than the motion before us now. You are asking for a breakdown of these wages salaries and distribution costs which go into the manufacture of such farm machinery, and I fail to see where you are going to gain any more information under the present motion before the committee.

Mr. HORNER (*Acadia*): I would point out that the committee has an economist hired to guide us, and I think you should consult with him and see if he thinks this is a legitimate question, fairly asked in order to try and arrive at distribution costs. I mean, is it fair to ask all the companies who will be appearing before us about management costs, labour costs and distribution costs?

The CHAIRMAN: Mr. Horner, I am not questioning your question, but pointing out that your motion is not specific. All you say is "for the past few years".

Mr. HORNER (*Acadia*): Then go back to 1954.

The CHAIRMAN: That is in the original motion. You have tied them back to 1954 there.

Mr. HORNER (*Acadia*): In my original motion I wanted a breakdown of wage costs, transportation costs, and something else I cannot remember now for the various machines. Now, however, I am asking for a breakdown of the number of people employed in administration, distribution and actual production. To me they are altogether different.

The CHAIRMAN: For these machines?

Mr. HORNER (*Acadia*): For all these machines of Massey-Ferguson, of Cockshutt when they come before us, of John Deer, International Harvesters and every machine company. To me it is an altogether different question—the amount of wages paid in each category.

Mr. NASSERDEN: Before the motion is put, I want to say that I think the first motion takes care of it. So far as labour costs are concerned, we have that in this brief, pointing out how many people are working.

Mr. HORNER (*Acadia*): No, we have a breakdown of the number of employees in Canada and the United States but they only total 9,000. The com-

pany's annual report says they have 35,000 employees, and that approximately 30 per cent of their production of implements is done in the United Kingdom where wages are a third what they are here—I mean half of what they are here. I certainly think the motion is advisable.

Mr. THOMAS: Mr. Chairman, would you accept a motion or an amendment to defer this motion to the steering committee?

The CHAIRMAN: An amendment would be in order if you would desire to move an amendment to this motion.

Mr. MUIR (*Lisgar*): I will second the amendment.

Mr. HORNER (*Acadia*): What is the amendment?

Mr. MUIR (*Lisgar*): That the motion be referred to the steering committee for discussion with our economist.

Mr. HORNER (*Acadia*): The economist is here.

Mr. THOMAS: I will make the motion, Mr. Chairman, and say a word about it.

Mr. HORNER (*Acadia*): The motion is made. If you are making anything, you are making an amendment to it.

Mr. THOMAS: You can always make a motion to refer a motion. You can defer it or refer it, and this is to refer it to the steering committee for this reason.

Mr. HORNER (*Acadia*): It is an amendment to the motion.

Mr. THOMAS: There is danger of getting into confusion over some of these questions, and I think it is better to take our time over a question like this. I think we should give it thorough discussion and probably the steering committee can get hold of the economist from the Department of Agriculture who should study it.

Mr. HORNER (*Acadia*): There are two of them sitting right behind you.

Mr. THOMAS: There are many of us who have waited all day to ask a few questions. It is about time to adjourn. Therefore, I think it is wise when these motions come up, instead of having them interfere with the routine which we set out to follow this morning, I think the motion should be first dealt with by the steering committee, and I think maybe sounder action would come out of that sort of procedure.

The CHAIRMAN: Mr. Muir, did you second that amendment? Seconded by Mr. Muir. I am ready for the amendment. All those in favour of the amendment to the motion? Contrary?

I declare the amendment lost.

Mr. Horner, will you read your motion?

Mr. HORNER (*Acadia*): The motion is as follows, seconded by Mr. Milligan, that I move that all machine companies appearing before this committee present figures for the years back to 1954 regarding the number of employees in each of the following categories: administration, production and distribution, and the aggregate amount of wages paid in each of those categories.

The CHAIRMAN: Gentlemen, are you ready for the question? All those in favour of the question? Those opposed?

I declare the motion carried.

Mr. HORNER (*Acadia*): Mr. Chairman, can I have the information as to who is on the steering committee?

The CHAIRMAN: Mr. Lahaye, Mr. Smallwood, Mr. Forgie, Mr. Boulanger, Mr. McIntosh, Mr. Peters and the chairman.

Mr. HORNER (*Acadia*): Before we proceed any further, for the benefit of the steering committee and those on it, I wonder if we could ask the economist, Mr. Gratton Haase, who is an economist hired by the government, to answer questions which I wish to put to him.

The CHAIRMAN: Is it agreed to hear Mr. Haase?

Agreed.

Mr. HORNER (*Acadia*): I would like to ask Mr. Haase this as an economist—and I think that is his business as an economist—he having heard the motion that was raised here a while ago dealing with machine companies submitting evidence to this committee. The evidence requested was that they give this committee the number of employees employed in the three categories, distribution, administration and actual production, to the best of their ability, of course. We understand that this is a difficult question for the machine companies to answer, but we ask them to do it to the best of their ability. We also ask them to give the aggregate amount of wages paid in each of these divisions. Now, Mr. Haase, do you feel that this question would aid the committee in studying the prices of farm machinery?

Mr. HAASE: Mr. Chairman, I could not anticipate what the final results of that information would be. I would imagine that some benefit might be derived from it, but I would repeat the warning that the vice-president gave as to the difficulty of defining just what each classification that had been requested contained, and I wonder whether the classification that you gave them is a suitable one to include all the activities of the company, and whether on the basis of that classification you will get the total outlay for wages and salaries which, I presume, is what you want. For example, where do engineering and research services fit into your classification?

Mr. HORNER (*Acadia*): If the companies want to break it down in more than those categories, they would be perfectly in order in doing so. What I wanted was a rough breakdown of salaries and wages, and I listed these three categories. If they want to break it down into a greater number of categories, it is their privilege to do so, and perhaps it would be wise for them to do so. Thank you, Mr. Haase.

Mr. KORCHINSKI: In 1960 they spent \$11½ million in research. This is part of the overall cost. This, as a percentage, could certainly be expressed.

The CHAIRMAN: We have Mr. Thomas, Mr. Horner, Mr. Korchinski, Mr. Hales, Mr. Milligan and Mr. Nasserden all wishing to make some comment. We have had a lengthy day. Is it your desire that we continue in an effort to finish by any reasonable time, or should we adjourn until tomorrow.

Mr. HENDERSON: I move we adjourn. All I have got is a headache.

Mr. EMMERT: Mr. Nasserden, I want to address this remark to you. I think you said earlier that I had been repeatedly stating that whatever information you had been requiring would not mean anything to the committee. I said that much of the information that has been asked for would be meaningless or not meaningful. I have never impugned the intelligence of the committee and its ability to interpret information. What I am trying to drive home is that it is not a practical thing to place a proper interpretation on the kind of information you are hoping to obtain. It will be meaningless, not meaningful.

Mr. NASSERDEN: It depends on how you look at it.

The CHAIRMAN: Before we adjourn, I have a letter from the Cockshutt Farm Equipment Limited addressed to myself as chairman. It reads:

Dear Sir:

In view of the committee's desire to pursue this inquiry to the specifics of cost analysis, we respectfully request a deferment of our scheduled hearing which has been set for Friday, May 5, 1961.

Yours very truly,

J. W. V. Adams,

Cockshutt Farm Equipment Limited,
Brantford, Ontario.

The CHAIRMAN: The only date we could defer this to would be to Monday, June 5. What is the wish of the committee?

Mr. HORNER (*Acadia*): Agreed.

The CHAIRMAN: Is it agreed that they appear on June 5, if that is agreeable to the company?

Mr. KORCHINSKI: I was going to ask if the officials of Massey-Ferguson would be prepared to meet with the committee to-morrow, or would they prefer to meet with us at another date?

Mr. EMMERT: Well, I must say that I have had a delightful time today, so I am quite prepared to meet to-morrow or any other time.

Mr. KORCHINSKI: I have enjoyed your company very much.

Mr. EMMERT: Well, we are perfectly prepared to stay over and meet with the committee tomorrow. I am afraid however that I will not be in possession of any more information of the kind apparently desired to-morrow than I am to-night. But if there are other questions on which we can be helpful we would be delighted.

The CHAIRMAN: The committee will now stand adjourned to meet to-morrow afternoon at 2:30 p.m.

NOTE: Appendix "A" (see this day's morning evidence)—General statement.

Appendix "B"

SALES, PRICES, FINANCIAL ASPECTS AND PROFITS

I N D E X

	<u>Pages</u>	<u>EXHIBIT</u>
1 - SALES	1 to 6	
North American Net Sales by Type of Product		I
North American Net Sales of Canadian Manufactured Farm Machinery by Territory of Sale		II
Canadian Net Sales of Farm Machinery by Place of Manufacture		III
Canadian Net Export of Farm Machinery by Territory of Sale		IV
Summary of Industry Shipments of Self-Propelled Combines in the North American Market		V
2 - PRICES	7 to 8	
Price Movement and Summary of Product Changes:		
- No. 72 Self-Propelled Combine and its predecessors		VI
- Super 92 Self-Propelled Combine and its predecessors		VII
- TO 35 Deluxe Gasoline Tractor and its predecessors		VIII
- MF 35 Diesel Tractor and its predecessor		IX
3 - FINANCIAL ASPECTS AND PROFITS	8 to 11	
Trend Comparison of North American Inventories, Dealer Receivables and Customer Receivables with North American Net Sales		X
Summary of Capital Investment and Earnings - World Wide Operations		XI
4 - SUMMARY	11	

I - SALES

Since its beginning with a small factory opened in 1847 at Bond Head, Ontario, the Company has literally developed with the country to its present world-wide position. Traditionally, its growth has depended heavily on its exports and on its operations in countries outside Canada. This is evidenced by its total sales by territories for 1960, which may be summarized as follows:

<u>Sales by Territories</u>	<u>Millions of Canadian Dollars</u>	<u>Percentage to total</u>
North America		
- Canada	\$ 62.	12.6%
- United States	144.	29.4
	<u>\$ 206.</u>	<u>42.0%</u>
Europe		
- United Kingdom	\$ 66.	13.4%
- France	56.	11.4
- Scandinavia, Germany, Jugoslavia, Austria, Italy and Others	69.	14.2
	<u>\$ 191.</u>	<u>39.0%</u>
Australia, New Zealand, and the South Pacific	<u>\$ 38.</u>	<u>7.7%</u>
Africa, Asia and Latin America	<u>\$ 55.</u>	<u>11.3%</u>
Total Sales	<u>\$ 490.</u>	<u>100.0%</u>

The above shows that North America, with 42% of total sales, was the company's largest market in 1960. This was due to U.S. Sales which accounted for 29.4% of the total - well over twice as much as Canadian Sales which accounted for 12.6% of the total.

To achieve its sales, the company maintains locally managed operations units for the manufacture and marketing of its products in each of North America, the United Kingdom, France, Germany and Australia, together with an International Export Operations Unit for the marketing of its products throughout the rest of the world.

In North America, which is defined herein to consist of Canada and the United States of America, there is a common market for the sale of agricultural machinery and implements in which Canadian and U.S. Companies, engaged in the manufacture and sale of these products, operate freely between both countries. Therefore, a meaningful examination of the Canadian Operation must be encompassed within the broader examination of the North American Operation .

The North American Operation consists largely of the manufacture of Combines at Toronto, and Tractors at Detroit, for sale in the North American Market and, to some extent, for export outside North America. From this North American Operation, the U.S. Market purchases products made by Canadians in Canada, Canadian Dealers enjoy the same prices as U.S. Dealers, and Canada's trade balance with the U.S. is favorably affected.

North American Sales

As may be seen from Exhibit I, attached, sales in the U.S. Market have increased since 1949 to more than offset the loss of sales to markets outside of North America which have virtually disappeared, whilst Canadian Sales have remained fairly constant. The change in composition of the Company's North American sales from 1949 to 1960 is summarized as follows:

<u>Net Sales</u>	<u>1 9 4 9</u>		<u>1 9 6 0</u>		<u>Increase or (Decrease)</u>	
	<u>Millions of Dollars</u>	<u>% to Total</u>	<u>Millions of Dollars</u>	<u>% to Total</u>	<u>Millions of Dollars</u>	<u>% to Total</u>
U.S.	\$ 82.2	51.4 %	\$ 143.2	69.4 %	\$ 61.0	18.0 %
Canada	47.7	29.8	54.9	26.6	7.2	(3.2)
Export	28.6	17.9	5.5	2.7	(23.1)	(15.2)
Other	1.5	.9	2.7	1.3	1.2	.4
Total	<u>\$ 160.0</u>	<u>100.0 %</u>	<u>\$ 206.3</u>	<u>100.0 %</u>	<u>\$ 46.3</u>	<u>-</u>

It is observed that the Company's North American Operation in 1960 was almost 70% dependent on the U.S. Market.

Canadian Manufacture

The impact of North American Sales on Canadian manufacturing, illustrated on Exhibit II attached, shows that increased U.S. Sales have more than offset disappearing sales outside North America. The change, from 1949 to 1960, in markets in which Canadian manufacture is being sold, is summarized as follows:

North American Net Sales of Canadian Manufacture	1949		1960		Increase or (Decrease)	
	Millions of Dollars	% to Total	Millions of Dollars	% to Total	Millions of Dollars	% to Total
U.S. Sales	\$ 36.6	45.1%	\$ 58.0	63.1%	\$ 21.4	18.0%
Canadian Sales	27.8	34.2	30.9	33.6	3.1	(.6)
Total North American	\$ 64.4	79.3%	\$ 88.9	96.7%	\$ 24.5	17.4%
Sales outside North America	16.8	20.7	3.0	3.3	(13.8)	(17.4)
Total	\$ 81.2	100.0%	\$ 91.9	100.0%	\$ 10.7	-

It is, therefore, seen that the Company's Canadian Manufacture in 1960 was 63% dependent on the U.S. Market, an increase of 18% from 1949, which offset a decrease in sales outside North America.

Canadian Sales

In Canada the sale of Canadian manufactured products (Combines) is greater than sales of U.S. manufactured products (Tractors), as may be seen on Exhibit III. The change from 1949 to 1960 in the composition of Canadian and U.S. manufactured goods sold in Canada may be summarized as follows:

Canadian Net Sales by Source of Manufacture	1949		1960		Increase or (Decrease)	
	Millions of Dollars	% to Total	Millions of Dollars	% to Total	Millions of Dollars	% to Total
Can. Manufacture	\$ 27.8	58.3%	\$ 30.9	56.3%	\$ 3.1	(2.0)%
U.S. Manufacture	19.9	41.7	19.3	35.1	(.6)	(6.6)
	\$ 47.7	100.0%	\$ 50.2	91.4%	\$ 2.5	(8.6)%
Manufactured outside N. America			4.7	8.6	4.7	8.6
Total	\$ 47.7	100.0%	\$ 54.9	100.0%	\$ 7.2	-

As can be seen from the above, Canadian Manufacture of Sales in Canada (Combines) has reduced from 58.3% of total sales in 1949 to 56.3% in 1960. This 2% decrease, together with a 6.6% decrease of U.S. Manufactured goods, has been replaced by an 8.6% increase in sales of Manufacture from outside North America, (mostly from Tractors from the U.K.). It is also pointed out that the U.S. Manufactured Tractors, in terms of net sales dollars, now contain about a 40% U.K. manufacture content principally due to Perkins Engines made in the U.K. by the Company.

The trend of the Company's sales, in Canada, from 1949 to 1960, shows that the sale of tractors made in the U.S. and the U.K. is increasing faster than the sale of combines made in Canada. Nevertheless, the largest sale of products in Canada is still of Canadian Manufacture (56.3%), mainly self-propelled combines.

Canadian Exports

Basically, the Company exports combines to the U.S. from its Canadian Manufacture, and imports tractors from its U.S. Manufacture. As may be seen from Exhibit IV, attached, this has resulted in a net export from Canada of \$37 million (in terms of net sales dollars) in 1960. The change, from 1949 to 1960, in the composition of net export of Canadian Manufacture may be summarized as follows:

Net Exports of Canadian Manufacture	1949		1960		Increase or (Decrease)	
	Millions of Dollars	% to Total	Millions of Dollars	% to Total	Millions of Dollars	% to Total
<u>U.S.</u>						
Export	\$ 36.6	109.3%	\$ 58.0	156.8%	\$ 21.4	47.5%
Import	19.9	59.4	19.3	52.2	(.6)	(7.2)
Net Export	\$ 16.7	49.9%	\$ 38.7	104.6%	\$ 22.0	54.7%
<u>Outside N.A.</u>						
Export	\$ 16.8	50.1%	\$ 3.0	8.1%	\$ (13.8)	(42.0)%
Import	-	-	4.7	12.7	4.7	12.7
Net Export	\$ 16.8	50.1%	\$ (1.7)	(4.6)%	\$ (18.5)	(54.7)%
Total	\$ 33.5	100.0%	\$ 37.0	100.0%	\$ 3.5	-

The foregoing illustrates that the loss of exports from Canada to territories outside North America has been offset by the gain of exports from Canada to the U.S. to maintain a favourable trade balance to Canada of \$37 million in 1960. Since Canadian sales to the U.S. market largely consist of Self-Propelled Combines manufactured in Toronto, the maintenance of the Company's Exports from Canada is largely dependent on the U.S. market for self-propelled combines.

Position in the North American Self-Propelled Combine Market

In order that Massey-Ferguson may continue volume production of self-propelled combines in Canada, the Company must at least continue to obtain its present share of the United States self-propelled combine market as well as maintain present penetration in the Canadian market.

The U.S. self-propelled combine market has grown steadily from an estimated 55.7 million dollar market in 1949 to an estimated 149.2 million dollar market in 1960 - a market equal to approximately 60 percent of the total 1960 Canadian Agricultural Machinery Market. During the same period - 1949 to 1960, the Canadian self-propelled combine market grew from 19.6 million dollars to 27.0 million dollars in 1960, a 38% increase compared with a 166% increase in the United States.

It is anticipated that the U.S. market will continue to expand, both in total units and dollar value as the market is still in a transition stage from small type machines to the larger capacity self-propelled types, whereas in Canada the transition has already occurred, particularly in the major grain production areas of the Prairie Provinces. Therefore, the growth potential for self-propelled combines is primarily in the U.S. market.

Measured in terms of number of self-propelled combines sold during this period, the growth has been similarly spectacular as the quantities increased in the United States from 21,452 units in 1949, to an estimated 28,956 units in 1960, a 35% increase. In Canada, the number actually decreased from 5,746 units in

1949, to 4,861 in 1960, having reached peak sales in 1952 of 10,585 units.

Annual data, in units and dollars, are shown in Exhibit V. The lower percentage movement in units compared to dollars reflects the trend to larger units.

Massey-Ferguson's share of this North American market has declined over this same period, from approximately 50% in 1949 to 30% in 1960. In 1960, the Company maintained this share despite a 27% decline in the U.S. market caused by unfavourable conditions and outlook during the normal buying period. Some improvement is expected in the 1961 market, and an upward trend is anticipated over the next three years.

The decline in Massey-Ferguson's share of the market has been largely due to increased competition from competitive combines being offered by leading U.S. companies. Massey-Ferguson had introduced its self-propelled combine in 1939, just prior to World War II. As a result, the Company entered the post-war market with a tested and proven machine that no other competitors had. At the same time, competitors had difficulty in producing competitive machines quickly because of shortages, etc. in the early post-war years.

This favourable situation temporarily offset the basic advantages of the major U.S. manufacturers, namely, more favourable location in relation to the market and more firmly entrenched commercial position.

By the early 1950's, these temporary favourable advantages to the company were largely offset by the fact that our competitors had developed acceptable self-propelled combines that substantially reduced our degree of product superiority. The period of the Company's superiority was not long enough to permit building of a strong Marketing organization in the U.S., or strong "brand" loyalty among farmers comparable to that enjoyed by leading U.S. Companies. This resulted in a gradual decline in market share until the current period, by which time our Marketing organization has been strengthened, and improved products developed.

2 - PRICESPolicy

The Company is well aware that it must give the best value it can for the price it receives, not only to meet competition but, more important, to satisfy the customer. Since our customer is the farmer, we must satisfy him by ensuring that he gets the best possible value for his dollar if he is to be successful. The success of the farmer is vitally important to the company, since the Company's future success is dependent upon the farmer's future success.

The Company's policy of pricing for the North American Market means that the Company does not charge more in Canada than it does in the U.S. - for example, our F.O.B. factory price is identical on a combine shipped to any location in North America. This gives Canadian customers the advantage of price resulting from our participation in the large U.S. Home Market.

Price Movement

In examining the price movement, it must be kept in mind that the Company can only suggest a list price and that the real price to the farmer is a matter between the farmer and the dealer. The Company, therefore, does not know the real price that the farmer actually pays the dealer, which involves such things as trading down from list price and valuation of equipment traded in. Our price movement, therefore, does not take into account prices of Company products beyond the published suggested list prices and allowances therefrom to dealers.

On Exhibits VI to IX, attached, the Company's price changes from 1949 to 1960 for four representative products (and their predecessors) sold in Canada, have been set forth together with the Dominion Bureau of Statistics Farm Machinery Price Index. Since the Company's prices are set forth in terms of Standard Recovery from Dealers, it is not directly comparable with the Farm Machinery Price Index which is in terms of retail values; however, a comparison is made to show that the Company's prices are following the same trends as the Farm Machinery Price Index. It should be further understood that the "Standard Recovery from Dealer" is reduced by price concessions from time to time in the form of (a) trading allowances as models approach a slow-moving condition due to introduction of new models, or (b) Sales Program allowances, from time to time, to offset seasonal short term fluctuations in the market, which we must correct in order to maintain regular production levels in our factories.

In addition to changes in Price Movement, a summary of Product Changes from 1949 to 1960 in the representative products sold in Canada is set forth on Exhibits VI to IX so that they may be examined in relation to the Price Movement.

3 - FINANCIAL ASPECTS AND PROFITS

As previously mentioned, a meaningful examination of the Canadian Operation must be encompassed within the broader examination of the North American Operation because the Company operates in a North American common market. This applies also to an examination of the financial aspects.

Financial Aspects

Since 1949, the competitive situation has resulted in an increasing amount of North American inventory at the dealer level to provide customer's requirements for a wide selection of products immediately available to him

close to his location. In order to illustrate the increase in investment resulting from this requirement, Exhibit X sets forth the North American Company inventories, dealer receivables and customer receivables in comparison with North American Net Sales. This increase may be further summarized as follows:

North America	1949		1960		Increase	
	Millions of Dollars	% to Total	Millions of Dollars	% to Total	Millions of Dollars	% to Total
Net Sales	\$ 160.0	100.0%	\$ 206.3	100.0%	\$ 46.3	100.0%
Company Inventory	\$ 37.1	23.2	\$ 86.7	42.0%	\$ 49.6	18.8%
Dealer Receivables	4.6	2.9	94.9	46.0	90.3	43.1
Company & Dealer	\$ 41.7	26.1%	\$ 181.6	88.0%	\$ 139.9	61.9%
Customer Receivables	3.2	2.0	46.7	22.6	43.5	20.6
Total Inventory and Receivables	\$ 44.9	28.1%	\$ 228.3	110.6%	\$ 183.4	82.5%

From the above summary it may be seen that where 26.1 cents investment in Company Inventory and Dealer Receivables for each dollar of sales was required in 1949, 88 cents investment in Company Inventory and Dealer Receivables was required for each dollar of sales in 1960 - an increase of 61.9 cents (or well over 3 times as much) since 1949. This increase was caused by an 18.8 cents increase in Company inventory (almost double since 1949) and a 43.1 cents increase in Dealer Receivables (from 2.9 cents in 1949 to 46 cents in 1960). These Dealer Receivables arise from increases in Dealer stocks which, for the most part, do not earn interest.

Customer Receivables consist almost entirely of loans to farmers and, in 1960, the Company has found it necessary to incorporate separate Finance Companies in order to handle these loans more efficiently. Since

1958, 100% of freight and handling charges, duty, excise and sales tax have been included in Retail type payment contracts if requested by the customer, and equipment financed has been covered by life insurance, collision and physical damage at the Company's expense.

Profits

The problems concerning determination of profits are summed up by a quotation from Page 16 of the report on The Canadian Agricultural Machinery Industry, by J.D. Woods and Gordon, Limited, dated April 1956, in connection with the Royal Commission on Canada's Economic Prospects. The quotation is as follows:

" Profits on Canadian Agricultural Machinery Companies -

It would be practically impossible to provide an accurate statement of the relative profits made by the four main companies in their Canadian Operations alone. Production is integrated between their Canadian and United States Plants, and different bases are used by the respective Companies for determining the selling prices of the products moving between the two countries. It is equally difficult to separate profits made on Domestic manufactures from profits made on similar goods when imported."

This quotation applies to Massey-Ferguson, one of the "four main companies", as much today as it did in 1956.

A summary of Capital Investment and Earnings of Massey-Ferguson, set forth in Exhibit IV on Page 41 of the above mentioned report by Woods and Gordon, on the Canadian Agricultural Machinery Industry, has been updated and is attached to this report as Exhibit XL .

From Exhibit XI , the following table shows net income or (loss) for the year as a percentage of sales :

<u>Year</u>	<u>Sales</u>		<u>Net Income or (loss) for the Year</u>	
	<u>Thousands</u>	<u>of Dollars</u>	<u>Thousands</u>	<u>% to</u>
			<u>of Dollars</u>	<u>Sales</u>
1939	\$	21,046.	\$ 705.	3.3%
1946		72,393.	2,126.	2.9
1950		164,128.	17,541.	10.7
1954		297,732.	7,194.	2.4
1955		285,744.	7,521.	2.6
1956		372,129.	3,159.	0.8
1957		412,411.	(4,737.)	(1.1)
1958		440,109.	13,025.	3.0
1959		475,544.	21,018.	4.0
1960		490,414.	13,154.	2.7
1954 to 1960	\$	2,774,083.	\$ 63,334.	2.3%

4 - SUMMARY

The continuation of the Company's operation in a North American common market, with particular emphasis on the sale of self-propelled combines in the U.S., is necessary to maintain (a) employment in its Canadian factories, (b) a continued favourable trade balance to Canada, and (c) the Company policy of offering the same price for its products to Canadian Dealers as it offers to U.S. Dealers.

In North America the Company's revenue is controlled by competition and its prices generally follow the same trend as the Retail Farm Machinery Price Index of the Dominion Bureau of Statistics.

The Company's World Wide profits, since 1954, have averaged only 2.3 cents on each dollar of net sales.

NOTES: (1) Massey-Harris and Ferguson Companies were amalgamated in 1953. Amounts shown for 1954 and thereafter are the results of the combined operation.

(2) The 1956 Profit and the 1957 Loss, before income taxes, are before deductions for minority interests of 168 and 225 Thousand dollars respectively.

(3) The 1960 Profit before income taxes is before a special provision for abandoned production equipment, less applicable taxes, of 672 Thousand dollars.

Appendix "C"

ENGINEERING—RESEARCH AND DEVELOPMENT

Farm equipment manufacturers are continually striving to improve existing machines and to develop new machines with major improvements. The very complexity of the problems faced has necessitated the removal of development work from the blacksmith shop into engineering departments staffed with highly trained technical personnel using the most modern technical equipment; dedicated to the development of equipment which will reduce manual labour, work more efficiently, and produce better crops at lower cost.

Engineering in Massey-Ferguson is centrally controlled by the Vice President Engineering but is not physically centralized or consolidated. This is a logical set-up for filling world-wide farm equipment needs. While different national market needs are characterized by a diversity of crops, soils, climates and farm practices, a wide range of market needs can be satisfied with one basic line of farm equipment. Certain local developments and modifications may be required to meet local market requirements or to take advantage of local manufacturing or purchasing economies. These modifications can, in many cases, be anticipated, planned for and accommodated in the basic design and the final details prepared by the local engineering department.

Centralized control offers economies of time, money and talent. It means that an engineering staff with a wide range of skills and facilities is available to the Company as a whole, avoiding duplication at the local level. The duplication of development work in several locations is eliminated and the best engineering talent in the Company can be brought to bear on the most important and difficult developments.

The Engineering Division has the responsibility of translating the

needs of the farmer as developed by Product Planning, into definite products.

This responsibility can be divided into three main broad categories:-

- a) Improvement of present design to provide an increase in performance and/or reduced cost.
- b) Design and development of new and improved models of current products or new products directly related to present Company activities.
- c) Applied research directed towards improving farm technology and, as an end product, farm machines which will work more efficiently, reduce labour and provide better crops at lower cost.

Detail design of a product must achieve the following character-

istics:- proper performance and reliability, safety, ease of maintenance -- capable of volume production and with customer appeal. These characteristics must be achieved at a satisfactory cost.

Laboratory tests are conducted to aid and substantiate theoretical calculations and design. Detail parts, assemblies and complete machines may be subjected to strength tests using modern strain gauge equipment. Simulated cycling tests which are correlated as near as possible to actual operating conditions may be conducted to determine life characteristics of various designs or materials, either on test rigs or a torture track, to obtain the most satisfactory and economical product. Some components, such as the cleaning mechanism of a combine, are laboratory-tested to determine the most satisfactory performance by studying air flow characteristics and material movement. In many cases laboratory tests can be conducted prior to the construction of expensive prototypes, resulting in considerable savings in construction and field test costs. Laboratory tests are also used to ensure

that production components meet requirements. Production machines, such as combines, are tested regularly on the test track as a quality control measure.

Field testing of prototypes is conducted under actual operating conditions prior to release for production to ensure a satisfactory product. In the case of combines, comparative loss tests are conducted to determine efficiency and capacity under varying conditions. These tests pin-point areas of a machine which are lacking in capacity and further field and laboratory studies are conducted, resulting in improved designs. The Toronto field test section has operated combines every month since April 1959 in some area of North America, threshing crops ranging from small grass seeds to corn, grown on dry and irrigated land.

The M-F Super 92 S.P. Combine is an example of a machine developed as a result of detailed laboratory and field testing aiding detail design. This machine with an increased capacity of as high as 29% over the M-F 92 S.P. Combine under certain conditions, with easier adjustments and added features, such as individual turning brakes, was provided with only a minor price increase.

Massey-Ferguson has been responsible for many innovations during the past years. A few are listed below:-

- a) Volume production of a self-propelled combine.
- b) The Ferguson system of mounted implements incorporating weight transfer, which allows the use of more powerful tractors of lighter weight, resulting in lower cost units with consequent fuel savings. This innovation has strongly influenced the whole design of tractors, implements

and other equipment.

- c) Variable speed traction drives for combines allowing better speed control to fit crop conditions.
- d) Sealed bearings on combines to lessen maintenance time.
- e) Low silhouette combines allowing ease of transport and storage.
- f) Ground speed P.T.O. on tractors whereby the operating speed of equipment such as side delivery rakes and various planting equipment can be synchronized with ground speed.
- g) Improved release mechanism for heavy duty cultivator shanks giving increased clearance for obstructions.
- h) Introduction of low cost family size self-propelled combine.
- j) Plated hardware such as nuts and bolts to prevent rusting.

Massey-Ferguson Standardization

Standardization is a very important phase of the world-wide Massey-Ferguson Engineering Division operation.

A standardized procedure covering such items as drawing preparation, release preparation, Engineering standards listing such parts as sprockets, chains, belts, pulleys, bearings and seals, laboratory testing and field testing has been established. This means that products designed in any Engineering department will have a common base for comparison by any other Engineering department.

This also allows the use of existing designs of whole machines or machine components in product development by any Engineering department whether or not the design was originally developed in that

department. The use of existing designs by not obsoleting parts saves Engineering costs and toolage charges. In many cases standardized design results in a lower product cost as more efficient production facilities can be provided to produce larger combined volumes.

Examples of parts used for many years by M-F are given below:-

- a) A combine sprocket released in 1921 is still used on production combines in North America and France and is planned for use on future machines.
- b) A combine cylinder end first used in 1921 was used until 1953 and was replaced in 1954 by an improved version which is still in production and will also replace the original design.
- c) Cylinder bars which were used on a machine from 1941 to 1943 were used on a new model in 1953 and are still used in production.
- d) Implements designed to fit the Ferguson tractor produced in 1939 have not been obsoleted by new, larger tractors developed in recent years. The larger tractors, using a category #2 hitch pin as originally defined by the British Standards Association and now a S.A.E. standard in North America, have provision for the use of category #1 hitch pins used on smaller and older implements. The Ferguson system of mounting implements as originally developed was the basis for the present standards.

Combine straw walker cranks and tractor transmissions are examples of parts which are economically produced in large volumes on specialized toolage.

- a) Cranks are produced in Toronto for combines assembled in North America, France, United Kingdom and Australia.
- b) Transmissions produced on highly automated lines in the United Kingdom are installed in tractors assembled in North America and the United Kingdom.

Industry Standards

A great deal of effort has been expended to compile standards which can be used by the farm equipment industry as a whole. This work in North America has been undertaken by the Advisory Engineering Committee of the Farm Equipment Institute, Society of Automotive Engineers and American Society of Agricultural Engineers.

Listed below are some of the Standards presently in use by the farm equipment industry and followed by Massey-Ferguson Engineering:-

- a) Application of hydraulic remote control to farm tractors and trailing type farm implements.

This standard establishes the specifications that are essential in order that any 540 r.p.m. power-take-off driven machine may be operated by any make of tractor having a 540 r.p.m. power-take-off drive.

This standard also covers the shielding which shall cover the drive line.

b) V-Belt Drives for Farm Machines

The purpose of this standard is to provide agricultural engineers with sufficient technical data to enable them to properly apply V-belt drives to farm machines. Use of this standard will contribute to the design of simple and economical drives that in turn will ensure satisfactory service to the user.

c) Farm Tractor and Implement Disc Wheels

This recommendation covers interchangeability of mounting between 15, 16, 18 and 20-inch farm tractor and implement wheels.

d) Cultivator Sweep and Shovel Mountings

This standard provides the following:-

1. Interchangeability of cultivator shovels and sweeps used on various types of footpieces supplied by the farm equipment industry.
2. A good fit and thereby better support for sweeps and shovels on such footpieces.
3. Ground clearance for the footpiece and the end of the lower bolt when sweeps are set flat.

e) Baling Wire for Automatic Balers

This specification covers annealed baling wire for automatic balers.

f) Specifications for marking Plowshares and other Soil-working Shapes

These specifications are recommended to cover the universal need for identification of materials used in plowshares and other soilworking shapes.

g) Three Point Free Link Hitch Attachment of Implements to Agricultural Wheeled Tractors

This standard specification sets forth the requirements for the attachment of three point hitch implements or equipment to the rear of the agricultural wheeled tractors by means of a three-point free link hitch in association with a power lift. As noted earlier this standard is based on the Ferguson system.

h) Farm Equipment Breakaway Connector

This standard covers a breakaway connector for lighting kit for pull-behind farm equipment. A standard farm equipment safety lamp bracket is also covered. This allows the mounting of one standard lamp on any make of equipment.

i) Agricultural Tractor Test Code

The purpose of this standard is to define test conditions, give a description of the tests to be made, specify data to be obtained, show formulas and calculations, define terms, and establish a uniform method of reporting so that

performance data obtained on various makes and models of tractors, tested in accordance with this standard, will be comparable regardless of where the test is made. This is the procedure for the Nebraska Tractor Tests which ensures factual published information on tractor performance.

The use of the various standards results in saving in engineering time, cost reduction of unit parts due to higher volume production and a very great saving to the user.

Prior to the adoption of the Power-Take-Off Standard, tractors had a variety of take-off spline sizes, various shaft locations and speeds. Implements also had a variety of shaft sizes and take-off locations. Special attachment kits were required to connect many machines and tractors, and a change to either tractor or implement would quite often require a new kit. The need for special attaching kits was eliminated when the standard was adopted.

Recently a 1000 r. p. m. power-take-off for farm tractors has been approved. The higher speed take-off has advantages for certain applications, particularly larger tractors where more power is available. Provision is being made, however, so that conversion assemblies will be available enabling implements and tractors to be changed between standards, thus not obsoleting a great deal of equipment at present on farms.

Standardization of Machines

It would be a benefit to a manufacturer to have a reduction in the number of models of various equipment such as combines and tractors. This would result in greater production efficiency, lower inventories, and simpler distribution and service. However, to satisfy the requests of our customers, product lines are becoming more and more varied.

A case in point is the number of variations of the M-F Super 92 S.P. Combine shown below which are required to satisfy customer requests:-

Super 92 S.P. Combine - Base Machine less variables
listed below.

Standard grain machine for corn.

Standard grain machine with tank.

Standard grain machine with bagger.

Cylinder Variables - one required

Rasp bar.

Spike tooth.

Table Variables - one required except for corn machine

10 ft. table for pickup tank only

12 ft. table and reel tank and bagger

14 ft. table and reel - standard " " "

16 ft. table and reel - standard " " "

Wheels, Tires and Tubes Variables - one required

13 x 26 6 ply R-1 Super Sure Grip Front Wheel

Rear 6.00 x 16 4 ply Rib Implement

13 x 26 8 ply R-1 Super Sure Grip Front Wheel

with rear 6.00 x 16 4 ply Rib Implement

13 x 26 6 ply R-3 All Weather Front Wheel

with rear 6.00 x 16 4 ply Rib Implement

15 x 26 6 ply R-1 Super Sure Grip Front Wheel

with rear 6.00 x 16 4 ply Rib Implement

15 x 26 6 ply R-3 All Weather Front Wheels

with rear 6.00 x 16 4 ply Rib Implement

18 x 26 8 ply R-3 All Weather Front Wheels

with rear 7.50 x 18 4 ply Single Rib

15 x 26 6 ply R2-0 Special Sure Grip Front Wheel

with rear 7.50 x 18 4 ply Rib Implement

There are also the Super 92 S.P. Hillside and Super 92 S.P.

rice version with various combinations, including rubber tires or tracks for the rice version.

Also produced are the 35 S.P., 72 S.P., 82 S.P., 35 Pull-type and 72 Pull-type Combines in various combinations.

It is sometimes advocated that a standard design of products should be produced by all manufacturers or that one manufacturer should produce all of a certain machine such as combines, while another manufacturer would produce tractors. It is felt that this would lower prices and simplify service.

This policy would remove the right of a purchaser to make a choice of equipment and thus indicate his approval or disapproval. Also the use of a common design would slow down the introduction of

improvements and, by eliminating product differences, lessen competition among manufacturers to the probable disadvantage of all concerned. Technological advances cannot and will not be made if design changes are prohibited.

Independent Testing of Machinery

It has been suggested that farm equipment should be tested and test reports issued, similar to the present method of testing tractors under the Nebraska Test Code. The Saskatchewan Government under the Agricultural Machinery Administration at Regina has conducted a number of tests of various types of equipment sold in that province. Reports have been issued covering the results of such tests which provide machinery users with information regarding machine performance.

Massey-Ferguson plans to cooperate fully with the Agricultural Machinery Administration and to use its services as an outside independent test facility for machinery in Saskatchewan. This, we feel, should be the attitude of all reputable manufacturers to such an organization, providing the tests are conducted under similar conditions so that the reports issued are directly comparative.

The equipment developed by farm equipment engineers has resulted in a reduction of the farm labour force in Canada from 1,200,000 in 1941 to 731,000 in 1959. It has resulted in safer and more comfortable machinery to operate, machinery

with less "down time" due to maintenance and breakdowns, more efficient equipment, and in some cases, completely new concepts of equipment. This has all contributed to the material well-being of the farmer.

Appendix "D"

MARKETING, DISTRIBUTION, SERVICING AND FINANCING OF SALES

Since the turn of the century, the farm implement business has grown from a very small operation to one of the major industries in Canada today.

This transition period has seen many changes in the marketing and distribution of farm machinery. Going back to the period 1925 to 1944, the farm equipment companies maintained a large number of Branch warehouses and distributing points, in order to service the numerous agents appointed by each company.

Most companies operated on a distribution system under which they consigned whole goods and parts to the Company's agents. This was necessary to adequately supply implements and parts since rural transportation facilities were very inadequate. Many Branch warehouses were required. Throughout this time, Massey-Harris, as then known, maintained 17 distribution points for whole goods, with 10 supporting warehouses which provided for additional distribution of parts.

In appointing agents, it was found necessary to have these agents close together in order to give adequate service and achieve maximum sales. It was considered necessary to open agencies in almost every hamlet or village.

These Company agents assumed no responsibility other than selling goods, and awaited Company personnel to take settlements. No service was given to the customer by the agent. Consequently, to support this large number of agents meant that Branch distribution points maintained large staffs. To illustrate, a Branch maintained 25

to 30 men on service staff alone. During the autumn collection season, staffs often increased to 60 or 70 men for the collection of retail accounts. Large office staffs of 60 to 70 people were maintained to perform the accounting services. It was necessary to provide temporary staffs of 20 to 30 people in the autumn for stock-taking of whole goods and parts at agencies. This created a costly distribution system which was prevalent throughout these years. In 1937, a House of Commons Committee recommended that the farm equipment industry should attempt to lower the distribution costs in selling farm equipment.

The total number of "Massey" dealers over this period was as follows:

	<u>1935</u>	<u>1939</u>	<u>1944</u>
Saskatchewan	540	481	419
Alberta	334	365	273
British Columbia	27	31	34
Manitoba	225	205	200
Ontario	412	390	383
Quebec	405	395	485
Atlantic Provinces	<u>353</u>	<u>227</u>	<u>163</u>
TOTAL	<u>2,296</u>	<u>2,094</u>	<u>1,957</u>

In 1944, Massey-Harris, took an important major step forward by changing its consigned contract or agency system, to an outright purchase contract. With the changing conditions, better roads, improved rail service, etc., a better distribution pattern began to take shape. This included a program of building bigger and better dealerships, with the ultimate thought and final goal of

giving better service to the farm customer. Other steps followed.

The first was to close many supporting parts warehouses. However, at this time, Massey-Harris still maintained 17 distribution points for whole goods and parts distribution. But the new marketing arrangement reduced the large number of service personnel required, since under the new contract the dealer assumed the responsibility for meeting the major portion of service needs. The staff required for stock-taking was eliminated, and by this time, the retail paper financed by the Company had been reduced to a very nominal amount, thus eliminating the necessity for large staffs of field collectors. This general pattern of operation still remains in effect today. Progress was also made in reducing the number of dealer outlets, and in 1950 these were as follows:

Saskatchewan	373
Alberta	237
British Columbia	38
Manitoba	151
Ontario	267
Quebec	172
Atlantic Provinces	<u>112</u>
TOTAL	<u>1,350</u>

From 1950 to 1958, this distribution system was generally maintained with only minor changes in the number of dealers.

However, in 1958, the Branch distribution system was cut to 11 points, by closing out a number of distribution points known as Sub-Branch operations. In 1959, one additional Branch outlet was closed. In 1960 a further step of amalgamation took place so that the

10 Branches combined into 5. The dealer organization consisted of 886 dealers. Branch operation areas are now located in Calgary, covering Alberta and British Columbia; in Saskatoon, covering Saskatchewan; in Winnipeg, covering Manitoba; in Toronto, covering Ontario; and in Montreal, covering Quebec and the Atlantic Provinces.

Throughout this period of time, the objective was to provide better service to the dealer and to the farm customer at the lowest possible cost.

Supporting the five Branch warehouses are the following numbers of dealers:

Calgary	193
Saskatoon	255
Winnipeg	101
Toronto	161
Montreal	<u>176</u>
TOTAL	<u>886</u>

To summarize this section on organizational changes, many improvements in the Company's distribution were achieved. Massey-Ferguson retail outlets had been cut to less than half the pre-war numbers. When steel-wheeled, horse-drawn equipment was handled by agents, greater numbers of retail outlets were required, if only because of the inadequacy of roads and means of transportation. The dealer with his greatly increased responsibility must now have sufficient area in which to work so that he can effectively render all the services imposed on him.

The dealer became a bona fide businessman, having considerable responsibility. This provided the opportunity to offer bigger and better facilities for the customer at strategically located areas relatively close to their operations.

Dealer Organization

The Massey-Ferguson dealer organization throughout Canada has been upgraded. This program has brought the dealer from a back-street business to a front-line operation. Today, the dealerships are a credit to the community. Dealers are active in their own communities and lend substantial support to their areas through payment of taxes and participation in community endeavours.

Today, the dealer is an independent businessman. He is responsible to his customers for providing adequate machines, parts, and service facilities, together with a trained sales organization. We consider the dealer a key part of our industry in Canada. Adequately servicing our dealers is an expensive part of the distribution system. The dealer's performance represents the Company's success. We are, therefore, continuously instituting policies to improve our dealer organization. This policy is in line with our view that business is placed where it is deserved. We must deserve our patronage.

Dealer Competition

Increased facilities and fewer dealers have not led to a reduction in dealer competition. In fact, competition in the farm machinery industry today is more vigorous than at any time in its

history. In order to survive, a dealer must make a profit, and in order to make this profit, he must of necessity do a large volume of business. Our move toward larger dealerships is a move toward even better, more able men - men with the capacity, imagination, and capital to render a first class service to their community. As a very general comment on the financial affairs of our dealers, we cannot bring ourselves to believe that they are making too much on their capital and management.

Farm customers are prone to seek out the best buy, and with the better road conditions and transportation we find the consumer is travelling many miles from his home area, endeavouring to obtain more for his trade-in machine through higher trade-in allowance and better cash prices. While this practice sometimes yields benefits to the farmer, it may increase his actual machinery costs as he is less likely to use the service facilities of his local dealer. But this is one of the facts of life in a buyer's market.

A dealer today must operate on a sound business basis, he must provide fringe benefits for his employees; radio and newspaper advertising must be maintained; repairs to plant and building must be made; sufficient working capital must be maintained to provide credit on accounts, many of which run past due. Dealers are burdened with such fixed costs as heat, light, water, taxes, etc. They must support charitable and community organizations and, above all, they must maintain a standard within the community which makes them respected

business operators. In order to achieve this, it is readily understandable that a business cannot be run on a "hit-or-miss" basis, but must be well-managed and yield adequate returns on investment and on the dealers time and management skill.

Dealer Volume

Massey-Ferguson's success in achieving larger dealerships, for reasons noted earlier, is reflected in the indicated changes in the volume of business of three dealers selected at random.

<u>Year</u>	<u>SALES VOLUME</u>		
	<u>Dealership 'A'</u>	<u>Dealership 'B'</u>	<u>Dealership 'C'</u>
1948	\$ 62,202	\$ 55,847	\$ 19,700
1955	136,924	99,900	39,200
1958	217,762	100,892	139,640
1960	517,090	228,707	130,300

This suggests that with the larger dealerships and wider territory, a better service to the consumer is provided.

Distribution

The reduction of Branch warehouses has been mentioned. This helped to solve one of the real problems of operating companies, that of the obsolescent inventory. Under the present organization, slow-moving inventories are maintained at only five points in Canada, against a previous ten, and yet adequate service to the consumer and the dealer are given.

Carload shipments have been a distinct help as C. L. versus

L. C. L. rates have a material effect on the ultimate consumer price. Increased strides have been made in the sending of mixed carload shipments to dealers, both from factories and Branch warehouses, thus giving more effective and cheaper service.

Marketing

This department of Massey-Ferguson is responsible for the distribution of whole machines to Branch warehouses and dealers; the organization of field representatives; branch accounting; retail and wholesale credit administration; repair parts distribution to dealers and customers; providing technical service information to dealers; dealer development and organization; general sales promotion and product training; and generally assuring that the end-users receive the service to which they are entitled -- primarily through the dealer -- after they have purchased our products.

Very substantial repair part inventories are maintained at nine Company-owned warehouses strategically located in Canada.

These inventories are supplied through a Central Repair Parts inventory control system with master warehouses located at Brantford, Ontario and Racine, Wisconsin.

Branch repair stocks represent approximately one year's supply of parts that have a movement of 15 or more units each per year in Canada. Parts that show less movement than 15 units per year are considered slow-moving and stocked at Central Inventory Warehouses only.

All Branch parts warehouses in Canada are linked with each other, with the Central Inventory Warehouses and with all U.S. Branches by a "telex" system. This system provides almost instantaneous information as to the nearest location of any required part.

Speedier Service for Customers

The Racine facilities comprise over one-half million square feet of parts stock and handling facilities - the Brantford depot area is approximately 170,000 sq. ft. These locations stock or control some 85,000 current service part numbers for Massey-Ferguson farm machinery. It is interesting to note that 20 per cent of these numbers or approximately 18,000 part numbers account for 95 per cent of our annual sales.

Our Canadian Branch and parts warehouses generally stock in excess of 20,000 numbers each applicable to their particular territories.

With our concept of Central Inventory Control, we have a complete, updated inventory status for all parts at all times for all Branches. This is achieved by means of modern electronic computer systems and all Branches are linked by a highly efficient telecommunication system, allowing for rapid transmittal of information.

For the fluctuating needs of the users of farm equipment, it is possible, therefore, to make full utilization of North American inventories and transfer them with a minimum of delay.

Additionally, an independent Traffic Operation has been set up to service Parts Distribution's needs, and air freight services are utilized to the extent required, allowing for deliveries within hours on emergency orders.

The 20,000 numbers carried in most Branches are those parts which through historical pattern are used to the greatest extent by farmers in each region. Stocks of slower moving parts are also maintained to the degree that analysis indicated they are required. All other parts are supplied from the main depot upon request, direct to a dealer or customer. Such orders are handled on an emergency system basis.

It is felt that our dealer organization has a definite responsibility in giving service, but we do not, by any means, overlook our own responsibility in this area. There is no intention on the part of this Company to transfer the full burden of Parts Distribution and responsibility for carrying inventory solely to the dealer. We do, however, insist that our dealers be cognizant of their share of such responsibility.

Our dealers must assume considerable responsibility in parts servicing and stocking as they are naturally more intimately acquainted with the farmer's annual and day-to-day requirements. It is not feasible, however, for the dealer to stock the slow-moving, non-current and semi-obsolete parts for all machines; rather, he should use his capital to stock all fast-moving parts applicable to

machines he is selling in his particular territory. He can then obtain from a Branch or parts depot slow-moving parts.

In addition to the physical inventory, special communication systems and special transportation facilities with which we support our dealers, we provide many special programs to assist dealers to control inventories and in use of available capital.

At the beginning of each fiscal year we offer each dealer a complete Parts Stock Order Program. This program provides him with the material and guidance to properly order the correct types of parts applicable to machines in his designated territory. Such orders are processed by the Branch during early winter months so that dealers are well stocked in advance of the season for use. Massey-Ferguson offers special incentives to dealers to participate in this program, such as extended terms beyond the season for use, at no expense to the dealer. In so doing we remove the capital problem from the dealer, enabling him to be fully stocked in preparation for the demand. Such programs allow the dealer to canvass customers early to determine and supply their parts requirements for overhaul work well in advance of the season of use.

To further assist our dealers to control inventories we provide them with:

1. A Parts Re-purchase Program.
2. A Parts Return Program.
3. A Parts Purchase Control Program.

Under the Parts Re-purchase Program, the dealer may return to the Company, once a year, for full credit, a given amount of parts based on his past year's purchases.

Under the Parts Return Program, a dealer may return any part within 30 days of receipt, for full credit. Any part that is shipped in error by the Company may be returned for full credit plus transportation both ways.

The Parts Purchase Control Program is a Company established method or system for the dealer to maintain adequate records and history on each part carried in his parts inventory. After working this system for a period of two seasons or more, a very accurate picture of his territory requirements is developed. This enables the dealer to more adequately order those parts - have them on hand to serve his customer's needs.

Special parts representatives are assigned to a specific group of dealers served by each Branch. These men are qualified to assist dealers with proper ordering, stocking, and general distribution of parts to customers.

We continue to make available from Branch and parts depot inventories, all machine parts for a minimum of ten years after discontinuance of production of any machine. On tractors and combines we service parts for a minimum of 15 years, balers for a minimum of 12 years. This does not, however, mean that at the end of these periods we automatically discontinue any parts. As

long as an individual part continues to show any demand for reasonable quantities we will supply it. For example, we currently service parts for machines that were discontinued in production well over 25 years ago because there is a reasonable demand.

Warehousing and distributing agricultural machine parts is a complex and costly phase of the farm machinery business.

As an example, our repair parts sales at dealer net in Saskatchewan for 1960 totalled \$2,797,000. Our Company-owned inventory at Saskatoon and Regina at 1960 fiscal year end was \$2,242,415. Exact value of dealer repair parts inventory is not available, but a reliable and conservative estimate of this amount is \$2,750,000.

Our dealer is responsible for assembling, pre-delivery servicing, delivering new machines, providing after-sale repair part and field service, and the handling, reconditioning and re-selling of used machines. The varied complexities of present day farm equipment, together with the direct effects of weather crops and soil conditions on farm machine requirements, operation and mechanical adjustments make the good farm machine dealer a key man in the agricultural community. His satisfactory operation requires a very substantial capital investment. It therefore follows that the farm machine dealer is entitled to a reasonable return on his investment and satisfactory remuneration for his efforts.

We believe we are now distributing our equipment in the most

economical and efficient manner available to us , and are continuing to improve this distribution as new techniques demonstrate their value.

Zone Marketing Concept

Massey-Ferguson, being fully aware of our rapidly changing times and conditions, is keeping abreast of developments that require new methods and techniques. For continued improvements in the area of good customer service for whole goods and parts, we are now testing in the United States a new Zone Concept -- an entirely new system of distribution on machines and parts. The objectives are to:

1. Improve customer service.
2. Expand field coverage and market penetration.
3. Reduce inventories.
4. Reduce distribution costs.
5. Improve the administration and control of field activities.
6. Provide a flexible system to meet the changing requirements of the Company.

This Zone Concept involves a highly centralized control of all our distribution activities in an area embracing four states and portions of three others. The most modern tele-communication system is used to effect the control. When the value of this concept is demonstrated, it can be adapted to Canada.

Provincial Legislation

Throughout the three Prairie provinces, Provincial

Governments have in the past, taken a very active part in guiding the agricultural machinery industry. This is understandable, as the economy of these provinces depends so heavily on agriculture. This involvement is reflected in laws and administrative orders which impose very specific requirements on farm machinery manufacturers and on their dealers. It is gratifying to note that very few cases have ever led to litigation in these provinces, and none of these involved Massey-Ferguson. In Saskatchewan the government has passed legislation which allows the consumer a 10-day trial period on any equipment. Also, it has established the Agricultural Machinery Administration (the A. M. A.), which requires that each dealer be licensed. In order to get a license, he must meet provincial government standards. In addition to our own testing, the testing of all equipment sold within the province is required at the A. M. A. testing depot in Regina. This means the Company must supply machines at no cost for testing purposes. Our engineers act as liaison with the A. M. A. and this becomes an expensive undertaking. Write-offs on equipment used in testing represent another cost to the Company.

In addition to requiring the Company to absorb the above costs, the A. M. A. requires that test results be published, and the Company has only the prerogative of suggesting "corrections". In many cases the desired changes suggested could prove extremely costly, and at the same time be applicable to only a single area of

North America. It also tends to have customers request warranty and reconditioning on machines after the proper warranty period has expired.

The A. M. A. has created its own standards of dealership operation in respect to volume of parts that should be carried; distances between dealerships; service facilities, and type and nature of dealers' premises. Thus, it frequently becomes difficult to interest promising businessmen in taking up new dealerships.

In the Province of Alberta, the Farm Implement Act requires that we, as a vendor, must maintain two parts outlets within the Province, not less than 150 miles apart. We do not feel, in view of the new and highly mechanized parts distribution facilities we are establishing, that such a requirement will yield better service to owners of Massey-Ferguson equipment.

Statutes in the Provinces of Manitoba and Saskatchewan require special order forms. This means expense to the Company, as the special order forms are applicable to these provinces only, not other parts of Canada. We are also required to provide, at our cost, special warranty forms incorporated in the order form; also a special rejection slip, which is again made at our cost. Should we waive the order form used in these provinces, it means that the trial period for rejection of the machine is increased automatically to 30 days, from the ten otherwise required. It is, therefore, necessary to maintain constant care to see that the forms are

properly completed, burdening us with additional administrative time and expense.

In the Province of British Columbia and the Maritimes, legislation requires registration of new machine notes taken on wholesale sales through the dealer. This is a further expense. Throughout all of Canada, an additional expense to the Branches is involved through the need for maintaining tractor exemption certificates. This requires a considerable amount of book-keeping and time on clerical duties.

Frequency of Model Changes

It has been stated that models are changed too often. Let us cite an interesting case by comparing the 20-85 Ferguson tractor and the 1960 Ferguson "35" -- which are quite similar in appearance. The grey Ferguson tractor was manufactured for a period of approximately nine years before it was superseded by the TO35. At that time, our Marketing Research indicated that the customer wanted:

1. More horsepower. This was increased by four.
2. More economy was desirable.
3. A standard P. T. O. was required.
4. Ground drive P. T. O. was required.
5. Better system of hydraulics.
6. Speed indicator was required.
7. More comfortable seat.

8. Larger capacity fuel tank.
9. Dual clutch.
10. Oil filter.
11. Larger tires.
12. Temperature gauge.

These were all incorporated into the Ferguson No. 35 tractor. This, however, left many of the components identical, and it did not mean a major change in many of the parts that the farmer required. There are many examples of component parts that can be obtained through the Parts Department that were on, as an example, the "21" combines, produced in 1941, as opposed to the present-day machines, and the same may be said of many of the tractor parts. We know that even though some designs such as tinware, etc., on our machines have been changed, the model changes are not, to any degree, like those of the automotive industry.

Buyers' Market

The dealer today is definitely faced with a buyers' market. With improved transportation, farmers are going much farther afield to try to obtain better trade-in values. The customer, exercising his sovereign right, plays one dealer against the other, endeavouring to get his trade price up. We know that the dollars earned by the dealer are entirely in accordance with his ability to trade wisely. The merchandising of second-hand equipment is of prime importance, and he must be able to evaluate used equipment, and also

quickly evaluate the amount required to recondition units he is dealing on. This requires a highly skilled businessman.

Many promotional ideas are used by dealers, such as giveaways, special discounts, free gasoline, along with extensive radio and newspaper advertising, in order to endeavour to beat competition. We give our dealers special off-season discounts as a means of overcoming the high seasonality of sales in our business. Probably the greatest single factor in competition today is country canvassing. The dealer must be alert to this, and be prepared to canvass continually in order to be competitive.

Retail Financing

We would like to make reference briefly to the Farm Improvement Loans Act, which from its inception to the present time, has provided the means for financing large amounts of farm equipment in Canada.

However, due to marketing difficulties and farm income conditions, particularly in Western Canada, the Farm Improvement Loan is not as effective as in the past. We are experiencing continual increases in the requests for retail financing. We have reacted to these needs by establishing a subsidiary company to handle this financing - and it is done at rates considerably below those which apply to automobile financing.

Appendix "E"

LABOUR RELATIONS

Facts About The Company And Its Employees

- (a) The total work force of Massey-Ferguson in North America, as of March 31st, 1961, was as follows;

	<u>HOURLY</u>	<u>SALARIED</u>	<u>TOTAL</u>
Canada	4150	2170	6320
United States	<u>799</u>	<u>2361</u>	<u>3160</u>
Total -	4949	4531	9480

NOTE:

Of the 9480 Massey-Ferguson employees in North America, 6320 (or 67 percent) were located in Canada.

- (b) Almost 55% of Massey-Ferguson employees are unionized. Most of the unionized employees in Canada and the United States are represented by the United Automobile Workers.

In Canada, a multi-plant agreement covers almost all hourly rated workers in Toronto, Brantford and Woodstock - a total of 4134 employees. In addition, the Company had entered into collective agreements with the Draftsmen's Association of Ontario, covering all draftsmen at the Toronto offices, and the International Union of Operating Engineers, covering stationary engineers in the Toronto Factory. Recently, a first agreement was signed between the Company

and the United Plant Guard Workers of America in respect of Toronto Factory guards.

In the United States, separate collective agreements with the UAW cover hourly rated employees at two plants in Detroit and the parts warehouse at Racine. In addition, office employees at Racine are covered under a collective agreement with the UAW. Hourly rated employees at Wichita are represented by the International Association of Machinists and at Kansas City, warehouse employees are represented by the United Mine Workers.

In North America, the Company has entered into 14 collective agreements with various unions covering 5129 employees.

- (c) In Canada, the Company first entered into a collective agreement with the UAW on November 5, 1943 in respect of Toronto Factory employees. Since signing the first multi-plant agreement on September 21, 1945, there have been 10 agreements signed between the parties. In the course of the negotiations of these agreements there have been six Conciliation Boards appointed.
- (d) Only on one occasion over the period of the collective bargaining relationship between the parties, has there been a lawful work stoppage. That was in 1954 when the Toronto local Union refused to sign an agreement that was acceptable to the Brantford and Woodstock locals. The Toronto Factory employees were on strike for 11 weeks from September 11, 1954 until November 29, 1954.
- (e) The current Master Agreement, with a termination date of December 15, 1961, became effective February 5, 1959. Negotiations with the

Union in Canada will likely commence in October, 1961.

Wages

While the Company makes no claim to leadership in the wages and benefit field, the fact remains that even under today's economic conditions, our wages and benefits compare most favourably with those of all Canadian industry, and in particular, the farm equipment industry.

In the wage comparisons set forth below, the data presented are in terms of individual employee earnings rather than total wage costs. The fallacy of using the total wage bill can be illustrated by considering two typical situations:

- i) the total wage cost is influenced by the volume of manufactured components purchased from suppliers rather than produced by the manufacturer. The relationship of components purchased and components made by the manufacturer can change significantly from time to time, thus affecting the total wage bill.
- ii) the total wage cost is influenced by the effect of introducing new techniques and new machines into the manufacturing process. Such a change would reduce the wage cost for hourly rated employees, but at the same time, it usually increases outlays on salaries or capital equipment, or both, since more engineers and technicians are required.

In general, we can say that the total wage bill in relation to value of output or any other measurement signifies nothing relevant to this enquiry.

(a) In December 1960, the most recent date for which comparable figures

are available, average hourly earnings ⁽¹⁾ in the Toronto Factory of the Company compare with the Dominion Bureau of Statistics reports on hourly earnings as follows:

	<u>Average Hourly Earnings</u>
Massey-Ferguson	\$2.19
Agricultural Implements	2.13
Durable Goods	1.97
Transportation Equipment	2.08
Iron & Steel Products	2.09
All Manufactures	1.82

Source: M-F Accounting Records
DBS - Man Hours & Hourly Earnings -
November 1960.

Thus, average hourly earnings in Massey-Ferguson are above the average in industry generally, and above the farm equipment industry in Canada. In fact, they are above the national average in all manufacturing by more than 37 cents per hour.

- (b) In the post war period (since 1945) the Company has negotiated wage increases, excluding cost of living adjustments not incorporated in base rates, as follows:

(1) When the term "average hourly earnings" is used it will be given the same meaning as used by the Dominion Bureau of Statistics, namely: "Gross wages before deductions for taxes, unemployment insurance contributions, etc. They include payments for overtime work, incentive or production and cost of living bonuses paid at regular intervals."

	<u>Cents per Hour</u>
1946	10
(hours reduced from 48 to 45 per week)	
1947	13
1948	8
1949	8.5
(hours reduced from 45 to 40 per week)	
1950	6
1951	7.5
1952	3
1953	5
1954	3
1955	5
1956	3.0
1957	3.0
1958	9.4
1959	7.2
1960	7.2

- (c) Average hourly earnings in Massey-Ferguson increased by \$1.33 from 1946 to 1959. This is a greater dollar increase than increases granted in industry generally (Exhibit 'A'). On a percentage basis, average hourly earnings increased by 153% over those prevailing in 1946. In all manufacturing the percentage increase of 1959 over 1946 was 142% and in the agricultural implements industry it was 149%.
- (d) Wages at Massey-Ferguson have increased at a substantially faster rate than increases in cost of living. As a result, M-F employees have seen their purchasing power increase significantly over the past 15 years. The improvement in 'real' hourly wages (purchasing power) of M-F employees since 1946 has amounted to almost 51% (Exhibit 'B').

Comparison of Indexes of M-F Average
Hourly Earnings and Cost of Living -
1949 = 100

Benefits

In addition to wages, Massey-Ferguson employees have received sizeable compensation from the Company through benefit programs.

- (a) The fringe benefits at M-F are generous in comparison with arrangements prevailing in outside industry. The cost of fringe benefits in January 1961 at M-F amounted to almost 28% of the annual payroll or an average of \$1275 per employee. The average total outlay for fringe benefits in 100 major manufacturing and non-manufacturing Canadian companies amounted to 22.2% of annual payroll per employee, or an average of \$1036 per employee. ⁽¹⁾

(1) Fringe Benefit Costs in Canada - 1959
Industrial Relations Counselors Service, Inc.

Average outlays for fringe benefits by industry ranges from 16.5% of payroll in Textile Mill Products to 26.6% in Food, Beverages and Tobacco. The percentage cost in all manufacturing companies surveyed was 22.8%. Iron and Steel products was 20.2% (Exhibit 'C').

- (b) Massey-Ferguson is one of the minority of companies providing Supplemental Unemployment Benefits at a cost to the Company of 5 cents per hour.
- (c) A non-contributory pension plan was first established by the Company in 1919. The Company and the Union negotiated a new pension plan in 1959 that is wholly financed by the Company with no contributions by the employees. It provides benefits that are as good as or better than industry generally.
- (d) The group welfare plan provided by Massey-Ferguson compares favourably with plans in other major companies and it is paid for entirely by the Company. Few companies in Canadian industry pay the total cost of a group welfare plan.

The I.R.C.S. survey lists only 6 out of the 100 companies surveyed that had a non-contributory plan. Of the 73 manufacturing companies surveyed, only 3 companies paid for the total cost of the welfare plan (Exhibit 'D').

The plan provides \$3,000 group life insurance, \$35.00 weekly indemnity for 26 weeks, and payment by the Company of Physicians' Services Incorporated, and Ontario Hospital premiums.

- (e) The present Collective Agreement provides for an escalation provision in which quarterly cost of living adjustments are made according to movements in the Consumer Price Index.

Wage Patterns

There are many criteria that affect the determination of wages such as the trend of wage movements; prevailing wages; cost of living trends; inter-company fringe differentials; labour market conditions; financial position of the Company; characteristics of the industry.

In addition, there are other external pressures, not the least of which is the power of the Union to shut down a company's operations.

Virtually, the whole automotive and agricultural equipment industry is organized by the UAW in Canada and the United States. The four largest UAW locals in Canada include three major automobile companies and Massey-Ferguson. In the United States, all major automotive companies and agricultural-equipment companies are organized by the UAW.*

This being so, whether we like it or not, M-F as well as the entire agricultural-equipment industry, is affected by wage and benefit patterns negotiated by the UAW in other industries in Canada and the United States.

Wage Differential - Canada and the United States

Historically, wages and earnings in the United States have been higher than those for similar industries in Canada. Exhibit 'E' shows the existing relationship between average hourly earnings of Canadian employees and United States employees in the same industries. In all manufacturing, U.S.

employees earned 29% more than Canadian manufacturing employees. In the durable goods industry, the differential is 27%. The same differential exists in agricultural equipment. Canadian employees in this industry were in about the same relative position as corresponding employees in the United States. In 1959, Canadian farm equipment employees were paid 17 per cent more than employees in all manufacturing industries, while in the United States the corresponding difference was 16 per cent.

We have already shown that M-F employee earnings significantly exceed those of the Canadian farm equipment industry and other industries with which comparisons are relevant. On the other hand, as shown in Exhibit 'E', 1959 average hourly earnings in U.S. agricultural equipment industry were 27% higher than in the Canadian industry.

Wages and Materials

Labour and material are the main factors influencing production costs. Exhibit 'F' shows that, since 1949, M-F average hourly earnings have increased more than the wholesale prices of steel and iron. The price of rolling-mill products has increased by 56% since 1949, while the price of iron has increased by 46%. This compares with the 73% increase in average hourly earnings over the same period.

Therefore, it can reasonably be said that the magnitude of the increase of the price paid for labour by the Company over this 10 year period is much greater than the magnitude of the increase in the price paid for material.

Wages and Farmers' Income

Exhibits 'G' and 'H' show a comparison of farm income per unpaid family worker with average hourly earnings of M-F employees.

The most dramatic illustration is shown graphically in Exhibit 'H'. It is evident that not only have wages of M-F employees increased more than the farmers' income during the post war years, but they have increased at a much steadier rate. Farmers' income has fluctuated significantly during this period from its present level of 58% over 1949, to the 1957 low of 8% over 1949, to the 1952 high of 62% over 1949. This compares with the steady, but significant upward trend in wage increases granted M-F employees to the 1960 level of 73% over 1949.

- (a) Includes group life insurance, hospital/surgical/medical benefits, major medical and catastrophe insurance, non-occupational sickness or accident benefits and occupational injury benefits above legal requirements.
- (b) Contributory pension and welfare plans include instances in which salaried employees are covered by a contributory plan and hourly employees (or employees under a union agreement) by a non-contributory plan. Furthermore, in the case of welfare plans some portion of an overall contributory plan may be totally financed by the company concerned. It should also be noted that in several instances contributory sick pay carries a non-contributory supplement. In some cases, this additional benefit is limited to salaried employees.
- (c) One company in this group has no pension plan.

TRANSPORTATION

We share Canadian farmers' concern about the several freight rate increases over the post-war years. Because of its severe joint impact on farmers, and on our Company, we present the transportation situation in the following statement in more detail than we have used in other supporting sections of this brief. We do this also because transportation costs are set by governments - largely by the federal Government. We appeal for the sympathetic interest and assistance of Committee members in containing further increases in freight rates.

The following information is presented to show the effect of freight rates on the price of agricultural implements, and to show the many varying ways in which Massey-Ferguson policies on transportation lead to the use of the most efficient means of transport.

To present a comprehensive statement on this situation, it is necessary to provide a brief history. The Committee is likely aware of the following historical facts:

1. Rail freight rates were generally stable during the war years, as they were frozen by government decree.
2. The first major Canadian post-war increase took place April 8, 1948, amounting to 21%, following which there have been several additional increases which are set out in chart form in Exhibit 3.
3. Freight rates within the United States and on international traffic were increased starting in 1946, and these increases were on a higher basis than Canada until 1952, when the scales of U.S. rates were exceeded by Canadian rates.

4. Insofar as the freight rates applied specifically to agricultural implements and tractors were concerned, the following describes the situation in broad outline:

- (a) Specific, or point-to-point commodity rates were in effect from manufacturing points in Eastern Canada to key cities and branch locations in Western Canada and in other regions.
- (b) These commodity rates were maintained on a lower scale than the regular "class" rates.

(bb) On April 8, 1948, there was an increase of 21%. Massey-Ferguson Limited was not in accord with the new basis as this resulted in a double increase (a) by the change from commodity to "class" rates, and (b) the 21% increase. Steps were taken through the Canadian Manufacturers Association to alleviate the impact of these increases. We were successful in that the 6th class basis which became effective December 27, 1948, was suspended. This order became effective on January 11, 1949.

- (c) The specific commodity rates were maintained in effect until July 24, 1950. At that time, the railways decided to eliminate the specific commodity rates to individual destinations and rates were published based on the 6th class rate, the railways having proved to the Board of Transport Commissioners that the commodity rates were not compensatory. Thus it was not necessary to have new rates published to individual destinations.

- (d) The change from specific commodity rates to the 6th class rate had the effect of increasing rates as shown in the column under June 16, 1950 (lower figures in Exhibit 7).
- (e) This was followed by a 4% increase on July 26, 1951, and an additional increase on February 11, 1952. The combines increase not to exceed 17%.
- (f) May 1, 1952, the Government, in order to assist the railways and spread the burden of operating in the high-cost, low-volume area between Sudbury and Fort William, provided a subsidy to the railways which was passed back to the shippers in what is known as the "Bridge" subsidy. This is shown in Exhibit 7.
- (g) The incorporation of the Bridge subsidy into the general rate scale caused rates to fluctuate as the subsidy was increased or lowered, depending on whether or not the entire amount of the fixed total subsidy was being utilized.
- (h) This was followed by an increase of 9% on January 1, 1953, and an increase of 7% on March 16, 1953.
- (i) The next major change was in 1955 when, on the basis of the Turgeon Royal Commission study, equalization was effected in the Canadian rate structure. Broadly speaking, this had the effect of raising rates in Eastern Canada by 5%, and lowering rates in Western Canada by 10%. This flattening out of the various scales was necessary to obtain equalization.

- (j) The new scale had the effect of changing rates from a minus 0.7% decrease in the case of Toronto, Brantford, etc., to Vancouver, to an increase of 13.7% in the case of Winnipeg (illustrated in Exhibit 7A). Percentages were not uniform as the Prairie and the mountain scales of rates originally in effect were on a different level.
- (k) At the time of the 1955 Equalization, because the rates within the West were lowered by approximately 10%, it also meant that there was a reduction in the rates from the international border points to Western Canadian destinations, thus giving an additional advantage to American-based plants. Decreases were up to 31%. We have no explanation for the larger decreases.
- (l) When Equalization came into effect in 1955, it wiped out the old numerical class rates and established rates which were based on a percentage of Class 100. In the Canadian Freight Classification some agricultural implements were accorded Class 40, and others were accorded Class 45. After conferences with the railways, an "Exception" was provided on agricultural implements between Eastern Canada, and from Eastern Canada to Western Canada, providing Class 40 or 40% of Class 100. This was comparable to the old 6th Class Rates.
- (m) The next major increase was on December 1, 1958, amounting to 17%. At that time, a letter was sent to the Honourable

A.J. Brooks and to the other members of his Rates Enquiry Committee, outlining the effect of this increase insofar as our industry was concerned. This will be considered later in this report.

- (n) The present scale will remain in effect until the government acts on the basis of the MacPherson Royal Commission report. The railways are faced with a strike threat because of wage demands, and whether or not the railways will be allowed to increase their rates is unknown. The railways already have a petition for an increase to the Board of Transport Commissioners, and it is generally agreed that it could amount to 20%. May we submit that any increase whatsoever would gravely worsen the position of Canadian farm machinery manufacturers who are already in a very clearly disadvantageous position in serving the great bulk of the United States market, and much of the Canadian market.

With respect of Item (m) above, following the submission, Company representatives were granted an interview with the Honorable A.J. Brooks early in January, 1959.

We were one of three firms granted an interview by the Honorable Mr. Brooks. In addition to the facts presented in the letter, which is Exhibit 8, we also pointed out to him various assisting methods which had been provided by the government, such as:

- (a) Subventions on coal from the Maritimes.
- (b) Subventions on coal from Western Canada.
- (c) Assistance to the Maritimes through the Maritimes Freight Rate Act.
- (d) Assistance to the railways and shippers through the Bridge Subsidy.
- (e) Possibility of further assistance by the government to the Maritimes on coal into Ontario against U.S. coal.

At that time, we were seeking assistance in penetrating the U.S. market as well as trying to alleviate the increases within Canada. The grave difficulties faced by Canadian based farm machinery companies in the high density portions of the U.S. market are considered later.

We consider the conditions which existed in 1959 still prevail.

We are of the opinion that our representations helped to shape the Government's decision to provide the subsidy, effective August 1, 1959, which reduced the proposed increase of 17% to 10% and later to 8%.

Subsequent to this, we had an interview with the Vice-President, Canadian National Railways, and the Vice-President, Canadian Pacific Railway Company. In this interview we enlarged on the information which had been provided to the Honorable A.J. Brooks and advised them that the position of a very large Canadian exporting industry was being imperilled by rising freight rates.

We made reference to the Woods-Gordon Report on the Canadian Agricultural Machinery Industry prepared for the Royal Commission on Canada's Economic Prospects. We cited that this Report states that the

agricultural machinery industry in Canada has operated under rates since 1919, which gives us an advantage in the Western provinces of Canada, all of the Eastern Canada and that portion of Eastern United States following a line from Lake Michigan south to a point slightly west of Cincinnati, Ohio, thence eastward along the Ohio River through West Virginia and Virginia to Norfolk.

Since the date of the Woods-Gordon Report we find that we have an advantage in Eastern Canada and a portion of the Eastern United States, although that line has moved east from the original points which Woods-Gordon showed in their Report. We are now at a disadvantage throughout Western Canada as compared to manufacturers located in the heart of the U.S. agricultural machinery manufacturing territory located in the Moline, Illinois - Davenport, Iowa area. The firms located in this area have a freight advantage in all of Western Canada and eastward from the Manitoba boundary as far east as Atikokan, Ontario. Rates for representative points are shown in Exhibit 1.

It will be noted that Exhibit 1 shows the rates from Moline, Illinois to Canadian destinations, and below are shown the rates from Toronto as a comparison. The Table shows the rates which were in effect from July 28, 1951 up to and including the latest increase. The differences in the rates between Canadian and U.S. manufacturing points are included to indicate the disadvantage or advantage in which our Company is now placed.

We also provide:

Exhibit 2. This is similar to Exhibit 1 in that it shows the rates from

Moline, Illinois and Toronto to specified points in Western Canada. This Table also shows the border basing points over which the combination rates are made.

Exhibit 3. This chart provides comparison of the Canadian versus United States rail freight rate increases by cumulative percentage and the years in which the increases were applied from 1946 up to and including the latest increases and decreases in the two countries.

Exhibit 4. Comparison of rates from Toronto versus Moline to key points in the United States which outline the boundaries of the present 15% of the North American market area where Canadian-based industry has an advantage. There are through commodity rates in effect from Ontario to points in what is termed "Central Freight Territory". This comprises the territory where we have an advantage. The Woods-Gordon study indicated (at variance with our analysis) that at the time of their study the proportion of the territory where Canada had an advantage was 26%.

Exhibit 5. Comparison of transportation unit cost for an average size combine from Toronto versus Moline to Western Canada, indicating advantage or disadvantage to Canadian industry.

Exhibit 6. Map showing approximate division of Canadian and U.S. market for agricultural machinery - 15% favourable to Canadian industry - 85% favourable to U.S. industry. This compares with 26% favourable to Canadian-based industry and 74% to the U.S. based industry as shown in the Woods-Gordon Report.

Exhibits 7 and 7A. These Tables show the rates from Toronto to Western Canadian points, including the various increases before and after

equalization of rates in 1955, and subsidy reductions.

A survey made in 1958 shows the Massey-Ferguson share of the "Harvesters and Threshers Combined" (which will be referred to as "self-propelled combines") market to be a declining percentage of that market since 1951. The Massey-Ferguson share of the U.S. combine market has shown a declining percentage since 1951 up until 1958.

During the years 1955, 1956 and 1957, an average of 76% of the company's production was sold outside of Canada, and over 79% during 1958. This includes the overseas market. However, over 63% of Massey-Ferguson Canadian production is sold in the United States. These figures reveal the critical importance of the bearing of freight rates on the accessibility of the American market for our products.

In summing up our position, we feel that we require:

- (a) Rate adjustments to overcome our competitive disadvantage in Western Canada.
- (b) Reduction in rates into the United States in order to retain and improve our present sales position, which in turn would increase the revenue of Canadian railways.

Canadian Traffic

As the size of our harvesters, threshers and haybalers grew, it was not possible to have them loaded on railway flatcars and obtain the minimum weight of 24,000 pounds as provided in railway tariffs. Consequently, we were faced with paying freight on "dead weight".

On October 30, 1952, at our instigation, the railways lowered the minimum weight to 18,000 pounds on open top cars not exceeding 41' 8",

and 20,000 pounds on open top cars exceeding 41' 8". This then allowed us to load two of the large combines on a flatcar and attain the minimum weight of 18,000 pounds, or three on a large car and attain the minimum of 20,000 pounds. No difficulty was encountered in loading plows, mowers, harrows, etc., in 40 ft. box cars to a minimum of 24,000 pounds.

Inbound Traffic

There are two aspects to this question, one being the movement of inter-plant raw products and components; and the other of raw inbound products and finished components from outside vendors.

With respect to inter-plant rates, the history is incomplete. We have always maintained contract truck rates which were considerably below the "going" rate of common carriers. The "normal" truck rates have very closely followed the pattern of the railways, falling slightly behind in announcing dates of increases, and at the present time there is very little difference between the two scales.

Contract truckers have been used since 1920 on Brantford-Toronto moves, and since 1941, on Woodstock-Brantford-Toronto.

The last increase in our contract rates on components and unfinished parts between Canadian factories occurred in 1957, and amounted to approximately ten per cent. Some of these rates run approximately sixty per cent of the common carrier truck rates.

Prior to this increase, we understand there had not been any upward adjustment since 1952.

With respect to inbound traffic to factories from outside suppliers, there have been many negotiations for lower rates. Various specific

commodity rates have been negotiated and established on regular volume moves, and downward adjustments are continually being made as special situations arise.

Inbound rates on steel, castings, etc., purchased within Canada and moved by truck have borne increases in freight rates but not to the same degree as the finished products. We have exercised every power to keep rates down.

Inbound finished components from U.S. suppliers have had to absorb the increases accorded international rates.

Inbound Traffic - Imports

In 1958, we commenced using direct U.K. - Toronto vessel service on tractors to reduce transportation costs. These imports naturally have been at the expense of Detroit production. This service has also been used, when manufacturing schedules permitted, on components from the U.K. to Detroit.

U.S.A. Traffic

Effective May 25, 1953, the minimum weight on harvesters - threshers, hay presses, windrow pickups and traction engines from producing points in Canada to destinations in what is known as Central Territory, i.e., Illinois, Indiana, Ohio and Michigan, was reduced from 24,000 pounds to 20,000 pounds per car. An adjustment also provided for proportional rates to Keokuk, Iowa; West Keithsburg, Iowa; Mackinaw City and Manistique, Michigan, etc. At the same time, lower rates as part of the through rates were established to Detroit, Michigan to be applicable on traffic destined beyond, in the States of Colorado, Iowa,

Kansas, Michigan (Upper Peninsula), Minnesota, Nebraska, North Dakota, South Dakota. These proportional rates resulted in an overall reduction in freight rates to these areas.

The volume of sales in the United States significantly affects our costs and any expansion of sales in the United States would bring benefits of scale economies equally to Canada and the United States.

Auditing

From 1939 to 1957, freight accounts were audited by an outside auditing firm, and refunds divided on a percentage basis. Now these freight accounts are audited first internally, before being sent out for a second check.

This audit reveals the most economical rates and routes so as to place the machine in dealers' hands at the lowest transportation cost.

Freight Charges

These are prepaid from factories to branches and dealers, and included in the invoice price. In this manner, the General Traffic Department can protect the dealer against railway errors through overcharges and develop lower combination rates.

Transit

Storage-in-transit arrangements have been negotiated with the railways at branch points and this allows the product to move out from branch to dealer as a continuous movement from factory, thus avoiding a combination rate involving two hauls.

Claims

By prepaying freight, Massey-Ferguson is responsible for recovery of loss and damage claims as well as overcharge claims, thus providing the dealer with the benefit of our knowledge and experience, and alleviating him of responsibility. This, in turn, reduces his freight cost and expenditure of time.

Diversions

Diversion of cars in transit after leaving the factory is practiced to make direct dealer shipment so as to provide the fastest possible service in meeting current sales, rather than making a new shipment from the factory. This eliminates branch handling charges which would otherwise have to be added to dealer expense.

Leased Equipment

We recently entered into a leasing arrangement from Detroit which is producing a service on some Canadian inbound traffic below the cost of common carriers. This will be expanded to other areas as experience indicates that economies can be secured.

Loading

Loading methods are constantly being reviewed to reduce costs and to increase weight to take advantage of lower rates applicable to higher minima loadings.

Ocean Rates

Rates have been negotiated with Ocean Steamship Conferences to

maintain import rates on components at the lowest possible level.

Freight Rates

Rates are constantly being scrutinized, and where indicated, proposals are submitted for reduced rates. We also work in conjunction with the Farm Equipment Institute on rate problems of interest to the entire industry.

GENERAL COMMENTSRate Increases

With respect to the MacPherson Commission Report referred to earlier, if the railways are allowed an increase of 20% it will mean the freight cost on a #72 Combine to Saskatoon would be increased by approximately 12%, or an additional \$25.50 per unit. This would greatly disadvantage us in comparison with our U.S. competitors shipping to the Prairies from the North Central States.

Distribution

Distribution at the branch level is costly to the Company and Dealer. We endeavour to make direct factory to dealer carload or truckload shipments. Where this is not possible, here are four other ways in which distribution is handled:

- (a) Goods are shipped into the branches and reshipped out on dealer's orders. If carload quantity is ordered, this can be on a storage-in-transit arrangement from the branch.
- (b) Dealers come into a branch and pick up individual machines from our warehouse.
- (c) Goods are forwarded via common carrier, truck or rail at less carload rates collect.
- (d) Leased Trucks by Branches - Some branches have entered into independent agreements to augment common carrier service to dealers. Dealers are charged something below

the common carrier rate, based on the branch estimate cost of operation.

Our choice of the most economic transportation method and our good advice to dealers on this matter reflects our determination to secure every possible economy in distribution and to speed up deliveries from factory to farmer.

To reduce distribution costs, stress is now placed on having the dealer take full carloads, or a stop-off car between two or more dealers, thus eliminating branch handling charges and effecting a saving in freight from branch to dealer.

Agreed Charges

In 1956 the question of Agreed Charges was broached to the railways on our particular traffic. The railways would not agree to publishing any Agreed Charges as most of our freight did not lend itself to truck handling.

Before the rail carriers will assent to an Agreed Charge the shipper must prove that some form of competition exists: i.e., truck, water, or private carriage.

Our traffic is presently moving under rail commodity rates. The carriers, therefore, would not negotiate any Agreed Charge as they could not foresee any increase in tonnage as a result.

The lack of competition with railways in many farm machinery transport operations may be due to the fact that contract truckers, as well as common carriers, have not shown any particular aggressiveness

in developing special equipment for hauling our products, which admittedly are generally cumbersome and hard to handle. It is also difficult to meet minimum load and earning requirements of the carrier.

Trucks hauling combines and set-up haybalers because of their unusual dimensions require special permits to operate on provincial highways. In addition, our facilities were originally set up for rail carload shipments, and the present facilities, especially at Toronto, render proper handling via truck difficult. However, we are continually working on this problem.

We are, however, aware that to provide more expeditious service at seasonal peaks, trucks are often more advantageous especially for transporting of smaller machines, and we take every advantage of such situations.

Plant Location

Surveys have been made of possible plant re-location so as to place us in the best competitive position and also reduce laid-down price to Canadian dealers and farmers. Needless to say, we very much hope that transportation costs or other factors will not require us to re-locate any of our Canadian production facilities.

Final Remarks

The General Traffic Department has many aspects of transportation to keep under surveillance. We must continually review changes proposed before the several bodies controlling the trucking industry in the United States, the various railway rate bureaus operating under the Interstate

Commerce Commission, the Canadian railways under the Board of Transport Commissioners, and the provincial truck transportation boards.

Whenever possible we appeal against proposed increases and look to other means of transportation to offset actual increases in rates.

To illustrate the importance of freight charges paid by Massey-Ferguson North American Operations we show freight charges paid by factories and branches and the relationship to net sales over a recent four year period.

YEAR	TOTAL FREIGHT CHARGES	TOTAL NET SALES	FREIGHT PERCENTAGE OF NET SALES
1956	\$ 8,225,000.	142,950,000.	5.75%
1957	7,192,000.	130,974,000.	5.49%
1958	10,627,787.	170,621,000.	6.23%
1959	12,747,379.	217,651,000.	5.86%

The foregoing information is presented to explain the policy of Massey-Ferguson, which in transportation and distribution methods as in production is motivated by the determination to minimize costs at every stage in delivering farm machinery to our customers.

GENERAL TRAFFIC DEPT.
FEBRUARY 8, 1961

**Massey-Ferguson Limited***Head Office, Toronto 3, Canada*

December 15, 1958.

The Honourable A. J. Brooks,
Minister of Veterans Affairs,
Parliament Buildings,
Ottawa, Canada.

Sir:

We respectfully refer you to the Board of Transport Commissioners Order 96300 which granted the Canadian Railways a 17% increase in rail rates, and approval of the increase was given by the Federal Cabinet. The increase took effect December 1, 1958.

We have learned that two Committees have been set up, one to study the over-all freight rate structure and the second one to present a plan to ease the impact of the latest increase on specific areas or industries. We understand that you are Chairman of the latter Committee.

In the Royal Commission investigation, J. D. Woods and Gordon reported on the agricultural machinery industry. We would like to quote paragraphs one and two on page 22 of this Report.

"This estimate indicates that the United States agricultural machinery industry has an advantage in outward freight costs in about 75% of the combined United States-Canadian market for agricultural machinery and the Canadian industry has a freight advantage in about 25% of this combined market.

"The map shown as Exhibit VI indicates that all of Canada is included in the area in which outward freight costs are favourable to the Canadian industry. Actually, western Canada is considerably closer to the centre of the United States industry at Davenport-Moline, Iowa, than it is to the centre of the Canadian industry around Hamilton, Ontario. In spite of this, the freight rates to most points in western Canada have been slightly lower from Hamilton, Ontario, than from Davenport-Moline, Iowa, since 1919."

This Report was published in 1956; however, the data used in compiling this Report must have been from rates in effect prior to that time, because our information is to the effect that the Canadian agricultural industry was already at a disadvantage in 1956. Subsequent to this Report, there have been further increases granted to Canadian railways as follows:

Massey-Ferguson

The Honourable A. J. Brooks

December 15, 1958.

July 3, 1956 - Board's Order 89030 - 7% increase
 January 1, 1957 - Board's Order 90447 - 11% increase
 December 1, 1958 - Board's Order 96300 - 17% increase

Within the United States and on International rates during the same period, the following increases have taken place:

Tariff X-196A - March 7, 1956 - 6%
 Tariff X-206 - December 28, 1956 - 7%
 Tariff X-206A - August 26, 1957 - (cancelled X-206 increase
 of 7% and added 14%)
 Tariff X-212 - February 1, 1958 - 3%

When the last U.S. increase was made effective in Tariff X-212, agricultural implements were specifically exempted from the general increase of 2% or 3%, depending on the category.

At the time of the July 3, 1956 increases, rates had then progressed to the point where they were in favour of the Davenport-Moline area.

This latest increase has the effect of further extending the percentage of the market and area in which we are at a disadvantage. As an example, we are showing on Appendix 1 the present rates from Moline to two points in western Canada as compared to the rates from Toronto for the years 1956, 1957 and 1958, indicating the changes which have taken place. We are also showing the freight cost per unit on a representative "Harvester" and "Thresher" combined.

We consider that these horizontal increases which have taken place in Canada in the past few years is the wrong method for all commodities, as certain basic raw materials and some manufactured products cannot stand such increases and still remain competitive. In fact, this latest increase means that we as a Canadian manufacturer of farm equipment cannot compete with U.S. manufacturers in the area west of Antikokan, Ontario.

In addition to the impact of the railway rate increases, we have an additional burden of the premium of the Canadian dollar to contend with on shipments into the United States, which places our Company at a further disadvantage when competing against United States manufacturers.

We are bringing this matter to your attention and forwarding copies of this letter to the other members of your Committee, so that they will be aware of our position when you are studying the over-all situation.

Yours very truly,

MASSEY-FERGUSON LIMITED

MINUTES OF PROCEEDINGS

TUESDAY, May 2, 1961.

(11)

The Standing Committee on Agriculture and Colonization met at 2.30 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Clermont, Cooper, Danforth, Doucett, Drouin, Fane, Forgie, Gundlock, Henderson, Hicks, Horner (*Acadia*), Horner (*The Battlefords*), Horner (*Jasper-Edson*), Howe, Kindt, Knowles, Korchinski, McBain, Milligan, Muir (*Lisgar*), Nasserden, Noble, Peters, Phillips, Racine, Rapp, Regnier, Ricard, Rompre, Smallwood, Southam, Tardif, Thomas, Thompson, Tucker, Villeneuve and Webb—(37).

In attendance: From Massey-Ferguson Limited: Mr. T. J. Emmert, Vice-President, North American Operations; Mr. W. J. Forsyth, General Sales Manager—Canada; Mr. N. H. Penney, Comptroller; Mr. D. W. H. Denton, Director, Personnel and Industrial Relations; Mr. J. G. Kingsmill, Assistant Comptroller—Financial Analysis; Mr. L. J. Child, General Traffic Manager; Mr. R. M. Snelgrove, General Attorney; and H. L. Hickey, General Relations Manager.

The Chairman provided the Committee with quotations from Beauchesne's Fourth Edition, Bourinot's Fourth Edition and May's Sixteenth Edition on the conduct of witnesses appearing before a House of Commons Committee.

The questioning of the officials of Massey-Ferguson Limited was continued. At 5.05 p.m. the Committee adjourned until 7.30 p.m.

EVENING SITTING

(12)

The Committee reconvened at 7.40 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Badanai, Campbell (*Lambton-Kent*), Clermont, Cooper, Danforth, Fane, Gundlock, Hales, Henderson, Hicks, Horner (*Acadia*), Horner (*Jasper-Edson*), Horner (*The Battlefords*), Howe, Knowles, Korchinski, Lahaye, McBain, Milligan, Montgomery, Nasserden, Pascoe, Peters, Phillips, Racine, Regnier, Rompre, Smallwood, Southam, Thomas, Thompson, Tucker, Villeneuve and Webb—(34).

In attendance: Same as at afternoon sitting.

The Chairman handed a letter to Mr. Emmert, officially advising Massey-Ferguson Limited of the resolutions passed by the Committee Monday, May 1st.

The questioning of the officials of Massey-Ferguson Limited was concluded.

The Chairman, on behalf of the Committee, thanked the officials of Massey-Ferguson Limited for their appearance.

Mr. Emmert asked for and received from the Committee permission to make a closing statement.

Mr. Emmert, on behalf of Massey-Ferguson Limited, invited the Committee to visit, at the company's expense, their Company and Engineering Test Centre in Toronto. The Chairman thanked Mr. Emmert for the invitation and advised him that the Committee would consider it.

At 10.25 p.m. the Committee adjourned until Monday, May 8th at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

TUESDAY, May 2, 1961.

The CHAIRMAN: Gentlemen, before the committee starts, I would like to quote from some of the highest parliamentary authorities on the conduct of witnesses appearing before a House of Commons committee.

First from *Beauchesne's* fourth edition, page 241:

295. (2) A committee has no authority to punish one of its members or other person, for any offence committed against it, as by disorderly words or contemptuous conduct, as, for example, when a witness refuses to testify, or prevaricates, but can only report such offences to the house for its animadversion.

Second, from *Bourinot's* fourth edition, page 482:

IX. Witnesses before select committee.—

If a witness should refuse to appear on receiving the order of the chairman, his conduct will be reported to the house, and an order immediately made for his attendance at the bar, or before the committee (q). If he would still refuse to obey, "he may be ordered to be sent for in custody of the sergeant-at-arms, and the speaker be ordered to issue his warrant accordingly, or he may be declared guilty of a breach of privilege, and ordered to be taken into the custody of the sergeant"(r).

Similar proceedings are taken when a witness refuses to answer questions (s).

Third, from *May's* 16th edition, page 674:

Misbehaviour of witnesses before select committees.—If a witness refuses to answer a question properly put to him, or to produce a paper which he has been directed to produce, the matter is usually reported to the house. In such cases the house has ordered the recalcitrant witness to attend at the bar, where he has been admonished by the Speaker as to the necessity of answering such questions as may be put to him by the committee (o).

To conclude, also from *May's* 16th edition, a quotation which shows how much authority a committee has in questioning a witness, page 674:

A witness is, however, bound to answer all questions which the committee see fit to put to him (f), and cannot excuse himself, for example, on the ground that he may thereby subject himself to a civil action (g), or because he has taken an oath not to disclose the matter about which he is required to testify (h), or because the matter was a privileged communication to him, as where a solicitor is called upon to disclose the secrets of his client (i), or on the ground that he is advised by counsel that he cannot do so without incurring the risk of incriminating himself or exposing himself to a civil suit (k), or that it would prejudice him as defendant in litigation which is pending (l), some of which would be sufficient grounds of excuse in a court of law. Nor can a witness refuse to produce documents in his possession on the

ground that, though in his possession, they are under the control of a client who has given him instructions not to disclose them without his express authority (m).

Are there any comments on these quotes I have just read into the record? For clarification purposes, there was some discussion, you recall, which arose yesterday as to the powers of the committee, and I hope that this will clarify to some extent what the powers of this committee are.

Mr. T. J. EMMERT (*Vice-President, Massey-Ferguson Limited*): Mr. Chairman, may I ask a question? As I understood your comments, they refer to a select committee. Is this committee a select committee?

The CHAIRMAN: It is a select committee. I would say that it definitely is a select committee. All standing committees are select committees, in my interpretation of it.

Mr. EMMERT: Is there no differentiation between a standing and a select committee?

Mr. GUNDLOCK: Standing committees are select as compared to a committee as a whole.

Mr. EMMERT: Do you agree with that, Mr. Snelgrove?

The CHAIRMAN: May I interpret what a select committee is? It is selected from the whole membership of the house. In this instance the members on this standing committee are 60—they are selected from the membership of the whole house. Therefore they are designated as a select committee.

Mr. SNELGROVE: Mr. Chairman, this is merely a point to correct any impression that we have obtained prior to this time, and correct me if I am wrong, but it seems to me that a standing committee is a continuing committee which has been appointed by the house, and a select committee is one usually appointed for a specific purpose. Once that purpose has been performed, then it dissolves. I note in the proceedings that have been published that this committee is called a standing committee on agriculture and colonization. I do not see the term or word "select" injected in its description. This is just for our own clarification.

The CHAIRMAN: Have you seen any reference to a select committee?

Mr. SNELGROVE: I have not, Mr. Chairman—not in these proceedings.

The CHAIRMAN: Are there no further questions on that? I think we should probably start from where we left off last night, and I had given the floor to Mr. Thomas.

Mr. THOMAS: I am a bit rusty on these questions I am going to ask, but referring to pages 11 and 20, the mandate of credit, my question is in regard to this: would it defer credit facilities or would more adequate credit facilities tend to reduce the price of farm machinery to the consumer? As background to my question I might point out that the intimation is made, I believe, on page 11, that the farmer-customer has been purchasing increasingly on credit—about ten lines down from the top of page 11. It goes on to say that these circumstances have inevitably increased the cost of investment in dealer inventory, and in providing marketing distribution, and servicing facilities. I do not just see where the inference is there, but taking that the matter of credit is mentioned, and again on page 20 they mention the Farm Improvements Loan Act, contributions to farm economy, again I do not see how that would affect the price of farm machinery. For that reason I am asking the question. Could Mr. Emmert comment or possibly give some amplification of those statements? In his opinion, would more adequate credit facilities tend to decrease the price of farm machinery?

Mr. EMMERT: Mr. Thomas, if I may reply to the second part of your question, that is relating to page 20, the reference to the price of farm machinery, I agree, is rather obtuse. What is in our mind there is that through the provision of an adequate method for retail financing on the part of the customer, it enhances his ability to provide himself with equipment that he needs. That, in turn, improves the volume of equipment sold by the manufacturers. Volume, of course, is a very vital function of price. As the volume improves, the cost factors thereby improve. Your fixed expenses can be written off over a large number of units. I explained yesterday, if you recall, that we were not in the business of buying time paper. We have set up these three retail finance subsidiaries solely for the purpose of providing our dealers with the sales tool, and we strongly and sincerely believe that it also provides a service to our customer with a means to obtain equipment that they otherwise might not be able to get. I think it follows they would not be interested in buying equipment unless they saw some benefit to themselves from the acquisition of the equipment.

Mr. THOMAS: You would say, Mr. Emmert, that the credit facilities at present have no bearing on the cost of farm machinery?

Mr. EMMERT: No, Mr. Thomas, I could not quite say that because I believe that without adequate credit facilities the volume of farm equipment purchased by the customers would decline, and volume is a very important consideration in price.

Mr. THOMAS: You say that the farmers of Canada today lack adequate credit facilities for purchasing machinery?

Mr. EMMERT: I am not qualified to say whether they lack them or not. All I can do is to repeat the figures we gave the committee yesterday as to the growth in the use of our subsidiary finance facilities.

Mr. THOMAS: What we are after here I think would be your opinion as to the adequacy. Maybe you would care to just express your own personal opinion from your experience with the Massey-Ferguson Company.

Mr. EMMERT: In that context I would have to say that it would be my opinion, based on the use that has been made of the company's credit facilities, that the farmers otherwise lack what they consider to be adequate facilities.

Mr. THOMAS: And that, by reducing possibly the volume of machinery purchased, may have some effect on the price and it would be in effect to raise the price. Is that correct?

Mr. EMMERT: No, I would say that the provision of adequate credit facilities enabling farmers to equip themselves, if they wish to do so, would tend to improve the volume sold and therefore tend to stabilize prices which on shorter volume would have to be increased.

Mr. THOMAS: That is what I mean. Is it your evidence that they presently lack adequate buying facilities, adequate credit facilities to purchase machinery, and therefore the volume being purchased is reduced in comparison to what it could be?

Mr. EMMERT: That is right.

Mr. THOMAS: Therefore the present price of machinery tends to be higher because of the lack of credit facilities?

Mr. EMMERT: I have added, however, Mr. Thomas, that our finance facilities seem to have filled the void. That is one reason for having them.

Mr. THOMAS: There is another question there, Mr. Emmert. Do credit facilities provided by Massey-Ferguson in any way increase the price, that is, through added carrying charges?

Mr. EMMERT: No. We recited yesterday the absolute simple interest percentage charged on our retail contracts. We stated that those terms in terms of interest—and I might add also in terms of length of payment—are completely competitive with any others being offered. We also stated that relative to terms a customer is able to obtain on automobiles, household equipment, etcetera, they are more favourable. The activities of the finance corporation are not considered in the price of the farm equipment. This becomes a separate transaction between our dealer and our customer. It is the price that the customer pays, and whatever bargain is worked out between the dealer and the customer, it is the same whether he pays on time or for cash within the scope of the dealer's circumstances at that point.

Mr. THOMAS: There is another question based on a statement on page 23 of the brief, near the end of the last paragraph there. The brief says:

We would not disagree with the conclusion of the Woods-Gordon report (page 37) that Massey-Ferguson "with its substantial manufacturing operations both in Canada and the United States will be in a position to choose the location of any expansion on the strength of the conditions affecting costs and market at that time". We also recognize the fact that United States based companies have a clear edge in terms of advantageous location in the high volume North American market. Unfavourable developments in either the transportation rate situation or in our labour rate position could render the present North American deployment of production facilities, uneconomic.

Mr. HORNER (*Acadia*): I have a few questions on finance.

Mr. THOMAS: There are some very serious implications contained in the statement in the brief and what I am going to aim at is to see if we can work out something a little more specific. In the brief you say:

Unfavourable developments in either the transportation rate situation or in our labour rate position could render the present North American deployment of production facilities, uneconomic.

Bringing that down to our Canadian situation would you say, Mr. Emmert, that an increase in transportation rate might have a tendency to decrease or restrict the manufacture of implements in Canada so far as your company is concerned?

Mr. EMMERT: Yes.

Mr. THOMAS: Then, would a decrease in the transportation rate tend to increase the manufacture of agricultural implements as far as your company in Canada is concerned?

Mr. EMMERT: Yes.

Mr. THOMAS: Going over to the labour rate position, would an increase in the labour rates tend to decrease the manufacture of implements in Canada as far as your company is concerned?

Mr. EMMERT: Yes.

Mr. THOMAS: Would a decrease in labour rates tend to increase the manufacture of agricultural implements in Canada as far as your company is concerned?

Mr. EMMERT: Yes.

Mr. THOMAS: There is another one. On page 21—

Mr. HORNER (*Acadia*): Mr. Chairman, I do not mean to interrupt, but we have jumped first to finance, then to transportation, then to labour. Yesterday we followed a continuity of questions until a certain subject was exhausted. Today we seem to be jumping up and down the full scale. Is this going to proceed?

The CHAIRMAN: I let one member, when he had a question, proceed with various questions, and there were some supplementaries interjected from time to time. I understand that you have a supplementary and as soon as Mr. Thomas has finished, we will hear you.

Mr. HORNER (*Acadia*): I do not say this for myself, but I am thinking of the report when it comes out. You will have a jumble of everything. If we took them in their proper order—financial aspects, engineering and research, distribution, labour and transport, certainly there would be some continuity in the report.

Mr. THOMAS: To deal with wage rates, page 4, Appendix E bears on matters of wage rates. Massey-Ferguson pay \$2.19 on average hourly earnings of their employees. On agricultural implements in Canada it is \$2.13; on durable goods it is \$1.97; on transportation equipment it is \$2.08; on iron and steel products it is \$2.09; on all manufacturing industries in Canada it is \$1.82. My question is this: why do Massey-Ferguson pay their hourly rated employees an average of \$2.10 per hour while the average wages paid in all manufacturing industries in Canada is \$1.82? There is a bit of background for that question. May I say that in a recent press release Mr. Eugene Forsey, economic advisor to the Canadian congress of labour has pointed out that the unions are not entirely responsible for increases in wages, that the manufacturing companies have increased wages and have to take their share of responsibility for the increased wages.

Now, can you tell us, Mr. Emmert, why the Massey-Ferguson Company have found it necessary to pay wages which are higher than other wages paid in the Canadian industry in view of the fact that also it was stated yesterday that the company was in business for profit, which we could well understand. Can you enlarge on that fact that you are paying higher wages than industry in general?

Mr. EMMERT: Mr. Chairman and Mr. Thomas, the comparison which has been drawn as between our average hourly wage of \$2.19 against all manufacturers at \$1.82, is a difference of 37 cents an hour. I think there are two major reasons for Massey-Ferguson paying a higher rate than industry generally, which is the other category. In the first place, as Mr. Denton defined yesterday, our hourly rated people are all organized, they are all members of a union. In Canada they are all, or practically all, members of one union, which is the united automobile workers. This union is a very strong and powerful labour body. They have a tremendous bargaining power. Our company has been fortunate in its, at least, recent history; there has been only one work stoppage. The penalty, however, for not having more work stoppages has been to keep pace within reasonable limits, I think, with the demands of the union representing our employees.

The second reason that Massey-Ferguson's rates might be higher than a more comparable section of the trade, namely the other farm equipment manufacturers is, as described yesterday, we have three major rates for paying our employees—the straight day, the measured day and the incentive plan. An incentive plan is installed literally for one reason, to obtain more work from a given facility through the output of greater effort—nothing strained but greater effort on the part of the employee. If he does that he is reimbursed at a higher rate than the man working on a straight day work basis. These two factors account for it. Mr. Denton, have you anything to add?

Mr. DENTON: I think the figures we have cited quite properly are national figures. The geographical location could account for a factor we have to consider.

Mr. EMMERT: That is a very good point.

Mr. THOMAS: Are those incentive programs included in that \$2.19 an hour?

Mr. DENTON: Yes it is, it includes all earnings.

Mr. THOMAS: And fringe benefits?

Mr. DENTON: It does not include fringe benefits.

Mr. THOMAS: You take X number of employees and divide the total sum earned and pay those employees for so many hours of work, and included in that total sum earned would be everything including incentive?

Mr. DENTON: It is the direct wage payments to the employee but it does not include fringe benefits such as pension plan.

Mr. EMMERT: Mr. Thomas, another word of explanation. Our company's operations in Canada only refer to the products we manufacture in Canada, primarily combines and balers, and such large items are pretty well integrated. We have a foundry, a stamping plant, and we go right from the raw steel in many points. As a result of that, our company has a very high level of skilled workers, particularly in the tooled capacity. Now, an abundance of skilled workers in any enterprise tends to raise the average hourly rate. I think you will agree, Mr. Denton, that our ratio of skilled workers to production line workers is higher than most other companies.

Mr. THOMAS: I wonder if you would refer to the remarks at the top of page 27:

We can affirm the finding of the Woods-Gordon report that our company, in its future expansion plans, will have to weigh carefully the advantages of labour cost, in a Canadian-based operation, against the transportation and other advantages of location in the United States.

You mentioned the transportation cost and the advantage of position. I take that to be an item explained yesterday as for instance, being over in Illinois in the Chicago area is a more advantageous position or location for an agricultural manufacturing industry than is for instance Toronto or Hamilton which is further removed from the larger areas of cultivation on the North American continent. You mention here "against the transportation" and other advantages of location in the United States. What would be the other advantages, other than transportation?

Mr. EMMERT: Mr. Thomas, some of the other advantages are not quite as easy to define as transportation and labour, but to our mind there are several. In the first place our experience is that it is more economical to provide a capital facility in the United States than in Canada. The reason is quite simple. Most of the manufacturers of capital goods operate in the United States. Most capital goods being imported into Canada for the construction of a new facility here are subject to duty. There is a great deal more building being done in the United States and notwithstanding the higher rates in the construction industry down there, it is possible to create a facility at a lower cost than in Canada in this area which we are concerned about. There are marked advantages of being located in or around the Chicago area because then your entire enterprise is at the centre of the market, the people that you have available for hire in the company are immersed in this agricultural industry to a far greater degree than the people in Toronto, let us say, or Hamilton. Some of these are pretty nebulous, but nevertheless have to be weighed in any sort of decision. The one feature of our operation that causes us to be able to do business in Canada to the degree that we do, and to bring to this country \$490 million in U.S. exchange, as we explained yesterday, is the relationship of labour rates, the hourly labour rate in Canada as opposed to the United States. If there is any attempt, a successful attempt, made to equalize labour rates as between Canada and the United States it will not be economic for our company to expand further in Canada.

Mr. HORNER (*Acadia*): I had a supplementary on Mr. Thomas' question on finance but he got away from that quite a while ago. I would like to know, due to the great deal of interest in figures, first of all for the two companies, subsidiaries of Massey-Ferguson, as set up, does one operate solely in Canada and does the other operate solely in the United States?

Mr. EMMERT: That is true.

Mr. HORNER (*Acadia*): Which one does the larger share of business?

Mr. EMMERT: The United States.

Mr. HORNER (*Acadia*): The one in the United States. Is there any comparison between the amount of business done in the United States and the amount handled through this finance company—as much as you have said, 33 or 34 per cent you did in Canada—what percentage of your business in Canada is handled by your finance company down there?

Mr. EMMERT: I do not have the figures, Mr. Horner, as to the percentage of financing done by our United States company. I can only tell you that they are lower and substantially lower than the figures in Canada. If I may, I would like at this point to provide you with the information I promised we would give you yesterday, as between the west and east breakdowns.

Yesterday, we recited that in 1959, 17.2 per cent of the retail sales had been accomplished in terms of retail paper. You are desirous of knowing how that really compared as between the west and the east.

Mr. HORNER (*Acadia*): I think the figures for the previous year, 1957 and 1958, were 33 and 34.

Mr. EMMERT: No, that is 1960 and 1961.

Mr. HORNER (*Acadia*): I am sorry.

Mr. EMMERT: In respect of 1959, in the west, defined as the province of Manitoba, west, 20.5 per cent of sales were accomplished through the medium of a retail finance structure; in the east, defined as Ontario, east, 12.6 per cent. In the year 1960, we said yesterday that the 17.2 per cent figure had risen to 34.1 per cent. I would like to make a correction there. The proper figure is 31.4. This was a topographical error.

Mr. KORCHINSKI: Is that total sales in Canada?

Mr. EMMERT: In Canada, 31.4 per cent of the sales were written against our retail plan. In the west, the figure was 34.9 per cent. In the east, the figure was 25.6 per cent.

The third set of figures, Mr. Horner, that we discussed had to do with the year through March, 1961. The aggregate figure is 33 per cent. The figure in the west is 38.1 per cent, and the figure in the east is 26.2 per cent. Mr. Horner, I think this takes care of the undertaking I made yesterday.

Mr. HORNER (*Acadia*): Yes, very well. I wish to thank you for providing this information so soon. Also, I must say that you have answered my question in regard to the amount of sales through your finance corporation in the United States, it being considerably less. All I wanted to know was whether it was greater or less. It is less?

Mr. EMMERT: Yes.

Mr. HORNER (*Acadia*): There is before the house, right now, a bill to enlarge the total amount loanable from \$300 million to \$400 million up until June 30, 1962. I have the thought in mind as to whether or not proper credit facilities are available to the farmer. Almost all these companies—particularly the one in Canada—charges 11 per cent interest, and the farm improvement loan charges are 5 per cent. This committee has done quite a bit of study into the finance angle. It has been suggested by other members that perhaps if the 5 per cent interest was raised to 6 per cent, and the banks were allowed to lend

on the farm improvement loan at 6 per cent, they would be more willing to make greater use of this. Some people might say that this is substantiated by the fact that 34 per cent of the sales in western Canada are at 11 per cent. Would you be in a position to table, at a later date, perhaps, the earnings of these subsidiary companies, particularly the one in Canada, so that we can judge as to whether or not there is a greater need for new facilities, such as the government finance corporation, to take these away from the banks. Apparently the banks have not been faced with the demand for farm credit, and I am thinking, as was suggested before the committee, that the new farm credit corporations could enlarge their activities in this field. I am thinking, perhaps, of an interest rate which could still be profitable to the people who would undertake it. I think, in order for the committee to judge this properly, one would have to know whether or not your company—and I understand your company is charging a flat 11 per cent to all farmers—and other companies in the finance business vary their percentage with the rate classification of the proposed borrowings. Some are down as low as 7 per cent, and some are higher than 11 per cent. Is it true that your company has a set 11-something per cent?

Mr. EMMERT: It is simple interest.

Mr. HORNER (*Acadia*): And it does not vary with the classification or the credit rating of a proposed customer?

Mr. EMMERT: Will you answer that question, Mr. Snelgrove?

Mr. SNELGROVE: Mr. Chairman, to answer your question, Mr. Horner, the rates do not vary as to the credit capacity or classification of a customer. However, I would like to point out that it is not a flat 11 per cent. As I pointed out yesterday, it is approximately 11.08 per cent, and, of course, this would vary to a small degree, depending on whether there were regular monthly payments or irregular lump sum payments throughout the year, or during the course of the contract. This interest rate, with the exception of the State of Arkansas, applies throughout the entire North American continent. The exception, in the case of Arkansas, is made because of the statute laws in that state which requires a 10 per cent maximum interest charge.

Mr. HORNER (*Acadia*): I have a few further questions in this connection. You suggested that they are not all on a monthly basis. Now there has been a long-standing view that farmers do not like payments coming due at the end of the month, because their income varies more or less semi-annually, rather than monthly. What percentage of your loans are made on a semi-annual basis?

Mr. EMMERT: I do not know the answer to that question. However, I know this: we provide a variety of payment plans so that the customer, in his own circumstances, may choose the one that suits him best. I would think—and this is an opinion—that the percentage being paid monthly, as opposed to seasonal payments, would vary with the economic circumstances, and it would certainly vary with the kind of equipment he purchases. In my judgment, the purchase of a combine, more likely than not, would be on a seasonal payment basis, while a more utilitarian piece of equipment—that is, one which is used the year round, such as a tractor—might be considered to be a better bet on a monthly basis. However, our purpose is to provide our customers with a free choice as to payment plans.

Mr. HORNER (*Acadia*): It might be beneficial to the committee if they knew what percentage of these loans were made on a monthly basis. I would think that a person who preferred a monthly basis would be one of those who was a part-time farmer. Perhaps he has a salaried job besides his farm, and he would prefer a monthly payment because of his steady income, whereas—and I do

not want to use the word bona fide farmer—a farmer wholly dependent on farming might prefer a seasonal basis. If we had a breakdown of this, the committee could then judge as to where most of the loans are being directed to. Another way of putting it would be, where most of the loans that are not being covered by farm improvement loans are going out from.

Mr. EMMERT: I would suggest that the relationship between the monthly payment and seasonal payment plan would vary substantially within the geography of our country. I think it is quite likely that the farmers in the west might elect to use the seasonal payment plan to a much greater extent than the farmer in the east. An example, that of the dairy farmer, was given. He has a relatively steady income. The same holds true for a poultry farmer.

Mr. HORNER (*Acadia*): Could you perhaps come at a later date and supply this committee with some information in this regard? Could you give us some approximate figures showing whether most of the loans made in the west are on a seasonal basis, so that it would be clear in the minds of the members of the committee where this gap is, and why it is there.

Mr. EMMERT: We will analyze the information in this respect, Mr. Horner, and, if it is available, we would be delighted to furnish it to you.

Mr. HORNER (*Acadia*): I have one further question in connection with this matter. Although I will not press it, could we have some idea—and I do not think that I would be putting any machine company in an embarrassing position, competition-wise, in asking this information to be made public, because other finance companies publish yearly figures as to their profits, sales and their liabilities, and so on—with regard to the one particularly operating in Canada.

Mr. EMMERT: Mr. Horner, in that respect, if the committee chooses, in its wisdom, to ask for that information from all financing sources which serve the farmer, then I think we would consider favourably the idea of providing you with that information. However, if it is to be a singled-out request for our finance company, then I would have to say that we cannot reveal competitive information.

Mr. HORNER (*Acadia*): Well, Mr. Emmert, as far as I know, the Lord being willing, I will be here to ask all the companies before this committee similar questions.

Mr. EMMERT: Let me be very clear on that. I did not say just the other implement companies; I said all companies financing farm equipment. This would include banks, finance companies, and small loan companies.

Mr. HORNER (*Acadia*): There is a list of them here. There is the Canadian Acceptance Corporation, the Equipment Finance Company Limited, Traders Finance, Industrial Acceptance Corporation, and so on. I do not know what their business is in farm machinery, but it is all public information. In 1959, Traders Finance made somewhere in the neighbourhood, of \$4,781,000 net profit. I know it sounds like a lot of money, but it is all public information.

Mr. EMMERT: No, not quite. What you do not find, in the case of Traders Finance, are the accounts of a wholly owned subsidiary, which is what you are requesting of us. You find there the same accounts which we have released in our annual statement.

Mr. HORNER (*Acadia*): O.K., fine. As I said, I am not going to press the issue.

Mr. SOUTHAM: Mr. Chairman, I have a supplementary question. I was interested in the final question put by Mr. Thomas in regard to your finance company, or the subsidiary you set up to develop this finance paper. Did I understand you correctly to say that it was wholly self-sufficient? I am assuming that with this 11 per cent which you are charging, it makes this

company self-liquidating, as far as the overhead is concerned, and that there is no charge-back directly to your machine company in order to carry on this line of financing.

Mr. EMMERT: At the risk of taking a long time to explain this, I think I should do so, as it is an important subject to the committee. Allow me to explain the organization of our Canadian finance company and how it operates.

Massey-Ferguson has offered, for a good many years, accommodation to retail customers. We have had retail finance plans for a long time. For many years we offered them in the name of Massey-Ferguson Limited. As the record which I have recited indicates, the value of the retail paper outstanding has risen quite considerably in recent years. Last year we felt we had gotten to a point where we should attempt to segregate the financial implications of the finance company, or the finance operations from the machine company accounts. Therefore, we set up Massey-Ferguson Finance Company Limited of Canada, a wholly owned subsidiary of Massey-Ferguson Limited. We maintain in Toronto an exceedingly small staff on the payroll of Massey-Ferguson Finance Company Limited. That company has entered into an agreement with the machinery company to reimburse the machinery company for the services of men already in the field—men on Mr. Forsyth's staff, whose job it is to travel the territory and call on the dealers. Part of their job has been, and continues to be, to collect accounts to ensure they are kept in order. The manufacturing company is reimbursed the cost, plus a nominal profit for the costs they incur in servicing the accounts of the finance company.

I believe the finance company was incorporated in August or September of last year. Our year ends October 31. We therefore had a very short year's experience last year and have had very little experience this year. Obviously we hope that this finance company will be a self sufficient entity. We do not know that yet. One element in the finance business is of extreme importance in the financial implications. It is one which is almost impossible to forecast accurately; that is the number of bad debts we might incur. This bears a very strong relationship to the general economic climate and to the economic well being of the customers who have chosen to use our plan. Obviously, based on history, we make what we consider to be good guesses as to the bad debts, repossessions, how much we can get for the material we may have to repossess; but only the future will tell us whether we are right or wrong. This, of course, is true in any finance company and the banks.

Mr. SOUTHAM: I am trying to pursue the thought as to whether or not we are providing adequate finance facilities to the farmers. You people have found out it is your business to provide this in order to step up sales. If an independent finance company carried on this function or if some government corporation were carrying on this full responsibility, would it take away from the overall cost of the price of farm machinery to the farmer? Are the facilities which you have a help? Do they increase the overall cost to the farmer?

Mr. EMMERT: We would have to say no. We offer more attractive rates than the other facilities, excluding the I.F.L.A.

Let me repeat a point I made yesterday. We encourage our customers and our dealers to use other financing facilities. We do not attempt to sell our paper. This is a sales tool for the purpose of increasing our volume. From our point of view it is a facility for the customer. We would welcome any opportunity to employ less of our limited capital in this field, because I think we can put the capital to more advantageous use in other elements of our business.

Mr. SOUTHAM: Thank you.

Mr. MILLIGAN: What percentage would the bad debts be?

Mr. EMMERT: Fortunately in Canada they have been very low. They have run less than one per cent.

Mr. KORCHINSKI: You mentioned you have been in this finance business for quite a few years. Could you tell us how long you have been in this financing business?

Mr. FORSYTH: Mr. Chairman and Mr. Emmert, it goes back at least to 1930. I think it goes back to the time when farm machinery was first sold on credit, which could be the early 1920's. From the time it was common to the industry, let us say, these services have been available to the purchaser.

Mr. KORCHINSKI: Was it in existence prior to the time when the dealers were merely mail clerks; when they were referred to in these terms as they merely put orders into the company, and so on. Was a similar type of service in existence in respect of these sales?

Mr. FORSYTH: There is quite a major difference. I am sorry I cannot give a date; but there was a time in the farm implement business which I believe extended into the 1930's when there was a significant difference between the cost of a machine purchased on retail credit and the machine sold for cash. Previous to the early 1930's it was uncertain whether it would be a credit sale or a cash sale. If it were a credit sale, whatever the amount of money was it was established. The finance charge went on to that. Then some time in that period the time payment price differential was eliminated. I think that was pretty much true of the industry.

Mr. KORCHINSKI: Had there been differences in the interest rates over the years?

Mr. FORSYTH: Yes; there certainly have been over a long period of years. I could not give you a specific answer to it. There was a time previous to my coming into the industry when there was actually compound interest collected on farm implement debts.

Mr. KORCHINSKI: How many years back would we have to go in order to establish the fact that there was an eleven per cent interest rate charged.

Mr. FORSYTH: I am afraid I could not answer the questions specifically. I do not think I could even answer it generally. I would believe that the rate—this eleven per cent rate—to the best of my knowledge might be slightly lower than what was the pattern. I think it might be closer to a twelve per cent figure.

Mr. KORCHINSKI: Could we say that in the 1950's eleven per cent was the rate commonly charged.

Mr. FORSYTH: I could not sincerely answer the question. I am not that accurate in respect of the figures.

Mr. KORCHINSKI: There is another question so far as interest is concerned. It seems to be that some of the other companies operate at a rate lower than that. Would it be fair to say they are taking a loss on this, or would you say you could possibly operate at a lower rate of interest than you are at the present?

Mr. EMMERT: May I answer that. I would have to question the accuracy of the information you have about the lower rates.

Mr. KORCHINSKI: If I may be permitted to introduce this, it seems to me that some of the other companies list interest rates as low as six per cent. This is the information as it was presented to me. It may not be accurate, but I seem to think there are interests rates lower than eleven per cent. Could you possibly operate at a rate lower than eleven per cent yourself.

Mr. FORSYTH: Mr. Korchinski, I think that the statements to which you are referring are in relation to these people who charge you half of one per

cent per month and where there are reductions made throughout the year in the total indebtedness. If you took the trouble to calculate that out in simple interest, it would come out to the figure Mr. Snelgrove gave you and you would find it substantially higher than 11.8.

Mr. KORCHINSKI: Does the farmer know what interest he is paying when he buys through you?

Mr. EMMERT: He certainly does?

Mr. KORCHINSKI: Would you have a form which would be available for illustration?

Mr. EMMERT: Let me read what the farmer sees. This is the document he signs: cash price, sales price, freight and handling, total cash price—whatever bargain the farmer has struck—cash deposit, the trade value, total cash in trade, the deferred balance—this is what he will pay interest on—financing or time payment charges delineated in dollars, insurance charges, registration fees, other charges if any, total time payment balance, aggregate contract price. We spent a long time devising this form so that we would be sure our customers knew exactly what they were signing. I think I can say it is written in clear English.

Mr. KORCHINSKI: But there is no reference to interest?

Mr. EMMERT: The interest is set forth in terms of dollars.

Mr. KORCHINSKI: But it is not stated in terms of rate.

Mr. EMMERT: You are speaking for the record.

Mr. KORCHINSKI: I wanted to get that established.

Mr. SNELGROVE: Mr. Chairman and Mr. Emmert, I will go back to your remarks, sir, as to this apparent six per cent rate of interest to which you referred. Do you know whether or not this interest rate included insurance coverage?

Mr. KORCHINSKI: It probably did not.

Mr. SNELGROVE: Do you know the maximum of time the loan could be established for? These all are relative factors. Secondly, this form—the conditional sales agreement—which the retail customer signs was taken primarily from the format of our American forms. You may know that in most of the states in the United States they have far more stringent retail instalment sales laws than we have. The only instalment credit act in Canada to my knowledge is the one in Alberta, the Credit and Loan Agreement Act. From that act we have taken what is required from the province of Alberta and have incorporated those requirements in this form. As I said before the delineation of the various facets of this transaction are taken from American formats which require the divulging of much more information than do the laws of Canada or any province. So here the Canadian farmer and consumer is obtaining the benefits of the divulging of more information than would normally be the case if we were not a North American company in concept.

The CHAIRMAN: Your chairman would like to interject at this time. I have endeavoured to give you wide range on the general statement. I have taken this opportunity to do so, because I know many of you find it difficult to be in the committee all the time it is proceeding. There are other duties which you feel necessary to engage in. I am wondering now if the committee would agree that we have reached the stage where we should go to appendix 1, sales, prices and financial aspects and profits. The discussion this afternoon has ranged pretty well around that. If we stay strictly to the context of that, then we could go to B. C. and D. in an attempt to finish up the brief. Would the committee be agreeable?

Mr. KORCHINSKI: I still have another question on that.

The CHAIRMAN: On the same question?

Mr. MUIR (*Lisgar*): I have just one short question which would take a short answer. It is on page 12.

Mr. KORCHINSKI: Can I ask one more question on this financing? It could be answered quickly or it could not be answered. The question is: do you have information which would lead you to believe that in all cases where machinery is being financed through your finance arrangements, that these people have tried to obtain a farm improvement loan or that they have a loan already and that perhaps they have gone to their limit. Are you satisfied that this is happening?

Mr. EMMERT: Mr. Korchinski, I think your question really in the first instance was: do we have information that will allow us to answer that question. We do not have. We do not question the prospective customer as to whether he has attempted to obtain an F.I.L.A. loan; we do not question him whether he has attempted to obtain a private loan. We assume that when he asks us for the service provided here, that that is exactly what he wants.

Mr. KORCHINSKI: It seems to me that sometimes some people might think that it is difficult to obtain a farm improvement loan—and this is my primary concern here.

Mr. NASSERDEN: Mr. Chairman, I believe yesterday Mr. Emmert indicated that he thought the reason this business was necessary was that people either had full use of the farm improvement loan or were unable to make full use of it because they were not farmers; that they had another occupation. I gathered that from your remarks, or it might have been one of the gentlemen over there who said that.

Mr. EMMERT: That was actually Mr. Forsyth who spoke on the subject.

Mr. MUIR (*Lisgar*): Mr. Chairman, there is a question I had hoped to have answered on page 12. It applies to costs. I note that on page 12 you say that since 1947 steel is up by 88 per cent and the hourly labour rates have risen by 117 per cent. Machinery is up 101 per cent. I was wondering how you arrived at these figures and what statistics you used for these particular figures.

Mr. EMMERT: The statistics you refer to, I suggest, are quite clear. We had an average hourly rate at the base rate in 1947; we have an average hourly rate now and the difference is calculable. We had steel referred, if you will recall, to rolling mill steel products which is by far our largest usage; and there again we had a price per ton of steel. Today we had a price per ton of steel of equivalent material. So again it is calculable.

Mr. MUIR (*Lisgar*): And the machinery costs?

Mr. EMMERT: The machinery cost is the relationship of our recovery from our dealer as opposed to recovery now on an average basis.

Mr. MUIR (*Lisgar*): In other words, these are based entirely on figures within the company?

Mr. EMMERT: I do not think that is quite true.

Mr. DENTON: I refer you to appendix F of exhibit E. I think you will see the data that we used in that appendix.

Mr. MUIR (*Lisgar*): I was just wondering—and this is the last part of my question—if these costs had been applied by the dominion bureau of statistics?

Mr. EMMERT: Looking at the exhibit, Mr. Muir, the average hourly earnings are Massey-Ferguson figures; rolling mill products is a wholesale price index which is D.B.S.

Mr. MUIR (*Lisgar*): The only statistic missing here, or that I do not see, is the one that mentions the cost of machinery.

Mr. EMMERT: Mr. Kingsmill, from where was that derived?

Mr. KINGSMILL: That is the D.B.S. farm machinery price index information.

Mr. GUNDLOCK: I wanted to ask, Mr. Chairman, before we move on, if I might be in order to repeat certain questions I asked yesterday and which I did not feel were answered. Will I be able to ask them?

The CHAIRMAN: I think, if the members are agreeable, we will endeavour to confine questions to section B, appendix 1.

Mr. HORNER (*Acadia*): Transportation. I have one question on page 1.

Mr. GUNDLOCK: I also have one.

Mr. DANFORTH: My question is definitely on B, and it has to do with the prices and the way the prices are established with sales outlets. From reading section B is it true, assuming in section B that the policy of the company is to have a definite recovery price from your retail outlets, which is a price they pay to the company for the machines, is that the policy of the company? In other words, in the distribution of your machinery you sell your machinery to the dealers and they in turn sell them to the farmer.

Mr. EMMERT: Our policy, Mr. Danforth, is to sell to our dealer, the retail outlets, not only here in Canada but in the United States. We also maintain a small number of company-owned retail outlets where we have been unable to find dealers, and we expect to receive from those retail outlets an amount of money which is known to them at the time they buy the product.

Mr. DANFORTH: Is it a company established price?

Mr. EMMERT: The company published and established price.

Mr. DANFORTH: I have another question—a series of short questions—all based on this.

My second question will be: is there a difference in the recovery prices to your outlets handling varied amounts of equipment? In other words, if one outlet would handle 200 units, would the recovery price be different per unit than an outlet handling say 10 units?

Mr. EMMERT: Mr. Danforth, I think if you do not mind, we have to change your question to dollars rather than units.

Mr. DANFORTH: Using any yardstick.

Mr. EMMERT: The answer is there would be a different net recovery to the company from dealers of varying sizes. We have a standard base price. Then we have, in keeping with many other manufacturers, in accordance with the laws of Canada, a dealer bonus system which is based on volume. We also have a dealer bonus system based on performance—that is to say, if his accounts are up to date at a certain time. After all of those deductions, we get what is left.

Mr. DANFORTH: Could they be called additional discounts on recovered price?

Mr. EMMERT: We would term them that, Mr. Danforth, because they are actually paid as bonuses for either volume or performance.

Mr. DANFORTH: In order to clarify this: in other words then, the dealer pays the standard or established recovery price, and at a later date he is reimbursed on a bonus basis.

Mr. EMMERT: Based on bonus and performance.

Mr. DANFORTH: He could conceivably obtain machinery at a different rate than another established outlet using the same machines?

Mr. EMMERT: That is conceivable.

Mr. DANFORTH: In effect, does that mean that two sales outlets could then have the same machine offered for sale at two different prices?

Mr. EMMERT: Mr. Danforth, that could be true even if neither of them earned any bonus.

Mr. DANFORTH: Yes, but it could conceivably mean, under that or any other system, two sales outlets handling Massey-Ferguson machinery have two different prices.

Mr. EMMERT: I cannot answer that question because it is a retail question. If I may rephrase it, it is possible that two outlets would have a different net cost.

Mr. DANFORTH: I agree to that, but what I want to establish is whether it is not possible, under your system of dealerships, for two dealers in an adjacent area to have two different retail prices for the same machine?

Mr. EMMERT: I had said, Mr. Danforth, that that is possible irrespective of any performance bonus. It depends on the dealer circumstances.

Mr. DANFORTH: I am not relating that to the bonus. What I want to know, sir, is to what degree and whether the company can police this?

Mr. EMMERT: The laws of Canada allow us to establish a suggested maximum retail price. The laws are quite precise that we may not establish, except within those limits, any price that our dealers may wish to charge.

Mr. DANFORTH: Mr. Emmert, to make it easier for you, may I rephrase my question in another way? Were I a dealer and charging what you as a company considered an excess price which might be working to the detriment of the company itself, what, if any, action could you take if I had a dealership?

Mr. EMMERT: Under the laws or within the law and under our franchise agreement with the dealer, we could take disciplinary action at our discretion up to and including cancellation of the franchise.

Mr. DANFORTH: In other words, by the control of the franchise you can, in effect, police any, what you consider, infractions of pricing to the farmer?

Mr. EMMERT: Only to the degree that we could demonstrate and prove that the dealer exceeded the suggested maximum retail. If we had a suggested maximum dealer price on a tiller of \$100 and the dealer extracted \$150 on a cash basis, that would be a clear infraction of our right. We could then take whatever disciplinary action it seemed wise to take.

Mr. DANFORTH: To get back to this other question on this bonus basis. If I were in a position to have a large agency and handled a terrific volume of business—which can only conceivably be held in a thickly populated area of small farms—I would be in a better position to give a better price to the farmer than perhaps a competitor in a less populated area?

Mr. EMMERT: Your ability to give a better price would be a combination of what you paid us, plus your cost of doing business. I think it is a truism in this business as well as other similar businesses, that the larger the outlet, the more fixed expense they have to absorb and the more costly their operation. Certainly the least expensive operation in respect to fixed expenses and overhead and labour is the single man operation. There is no question about that. The prices that you might charge would depend on those two factors, the cost of doing business as a retailer plus what you paid?

Mr. DANFORTH: But, so far as the Massey-Ferguson company is concerned, I would be in a position to have a greater cushion, or reserve, on which to act?

Mr. EMMERT: You have the possibility, if you achieve your volume objectives and live up to your performance expectations, of obtaining a lower net cost on the goods you bought from us. Whether you can translate that into lower prices depends on your policy of doing business.

Mr. DANFORTH: Is it not conceivable that I, as a wholesale importer, could import 135 tractors from Great Britain?

Mr. EMMERT: I know of nothing to prevent you if you become an entrepreneur in buying in Great Britain, but not from our company in Great Britain because we have a franchise dealer system there. Of course, you could buy by whatever means available to you and import into Canada.

Mr. DANFORTH: As a wholesaler?

Mr. EMMERT: And then sell the tractors for whatever prices you wanted. We cannot prevent you from doing that.

Mr. DANFORTH: In your dealerships in North America and in Canada, are there any dealers who act both as importers and retailers, who are in a position to tax a double commission?

Mr. EMMERT: Would there be any dealers who act as both importers and retailers?

Mr. DANFORTH: In other words, who act as both wholesalers and retailers?

Mr. EMMERT: Not in our organization, but I think you used the word "conceivable". There could conceivably be such a dealer but none of them do this, to the best of my knowledge.

Mr. DANFORTH: Would such a dealer be in a position to charge a double commission?

Mr. EMMERT: I would not be in a position to answer that without knowing what he paid for the tractors in Great Britain and what pay arrangements he had over there.

Mr. DANFORTH: But it is conceivable that a wholesale importer could act on a commission if he had a retail outlet? He could have a commission there as well?

Mr. EMMERT: I could not answer the question in the context of "conceivable", because I can conceive almost anything. Let me put it this way. It is not done as a practical thing because it is not economic. Buying arrangements in Europe are very difficult to come by on advantageous terms which might allow a man to do this.

Later on I am going to deal with distributors and there are a lot of them in this country. Let me start the list with a tractor named Hanomag from Germany. They do exactly what you are proposing; they import and they retail. I do not know what price they pay in Germany and I do not know if they extract a double commission. That is their business but the point I want to make to the committee is that firms who do business in that way are just as much competitors of ours as those who have capital facilities in this country and whatever information the committee wishes to obtain in relation to its inquiry into the prices of farm equipment must, I suggest, in fairness be obtained from firms like this who sell to customers and not just from the manufacturers. I think that answers your question. You would want to have a representative of Hanomag whom I recommend to you as an importer retailer to provide the answer you want.

Mr. DANFORTH: May I carry on a little further in order to clarify this. You have talked about importing tractors from Europe, but could I import 120 tractors from your plant in Detroit? Could I import 100 Massey-Ferguson tractors from Detroit and retail them here? Could I do that on double commission?

Mr. EMMERT: If we knew that was what you wanted to do, if we knew that was what you had in mind, we would never provide you with a franchise to do business in Canada. You would not be a franchised Massey-Ferguson dealer but, as a private individual, there would be nothing to prevent you bringing in 100 Massey-Ferguson tractors, but you would not be able to buy them from our company in the United States on franchised dealer terms.

Mr. DANFORTH: In other words, I could not buy them from your company on a recovery price unless I were a dealer?

Mr. EMMERT: That is correct.

The CHAIRMAN: Mr. Gundlock you wished to ask a question.

Mr. GUNDLOCK: I shall pass at this stage.

Mr. RAPP: Mr. Chairman, it is stated in the brief—

Mr. PETERS: Before we pass from this point, are there any other companies of the same type and in the same position as Hanemag? I never heard of the company before. David Brown is not a well known company and yet they are selling a lot of tractors in my part of the country. They are new and only have an agency in the last few months.

Mr. EMMERT: Let me reply to that in this way—to the best of my knowledge the companies who are competing for the custom of the farmers and who have manufacturing facilities of any size in Canada are Massey-Ferguson, International Harvester, Cockshutt, John Deere—to a limited degree—Otaco, the George White company and Versatile in Winnipeg. I believe Hydraulic Engineers is the right title now. Then there is McKee Industries. That may not be a complete list but it is a reasonable one.

I should now like to ask Mr. Forsyth, who is face to face every day in the marketplace with competition from all sources, to list for you to the best of his ability those people who compete with us in the Canadian market but who do not have any manufacturing facilities. In other words, they are distributors of all kinds of equipment.

Mr. FORSYTH: Mr. Chairman, let me start with internal combustion tractors but, before I name any of these, I wish to state that I am not entirely certain as to their exact structure and methods of doing business in Canada. However, in the case of tractors, there are David Brown, Nuffield, Renault, Porchet, Hanemag has been mentioned and Oliver import a form of David Brown tractors under their own name and I think Allis-Chalmers bring in one too. We should also have to include J.J.K., Minie-Moline. In fact, I should have an index before me to answer this question. These are major tractors. Oh, I forgot the Fordham. I do not know if they have manufacturing facilities in Canada. There are some other major competitors.

Let us look at some other fields, such as the New Holland, which is a pretty large industry, of course. It has a short line of principally hay tools. Then there is the New Idea, and Gale, also Blundel, and the Caldwell mowers. That will give you a sample of types there.

I want to go back to the European side of the picture for a moment. You have numerous forms of implements being imported, such as tillage tools and specific types of cultivation tools. You have very important items to the farmers' dollars such as barn cleaners. They represent a large capital investment to the individual farmer. Then you have dairy equipment of various types. You may think immediately of firms such as Surge and deLaval. I think that deLaval has a manufacturing plant around Peterborough. That is one I missed on my list.

You have items such as grain elevators which make up a very substantial amount of dollars in farm purchases.

Now, few if any in this list of names, with the exception of deLaval, have manufacturing facilities in Canada. However, most of you men will know of one or two more than we have not mentioned.

There are different methods of importing these tractors. I did not mention the Fiat, of which Cockshutt Plow are the sole distributors in Canada. That is another tractor which is a competitor in Canada. They are doing business through a Canadian manufacturer, to the best of my knowledge.

I do not think I could quickly give you any more significant answers than the ones I have covered. Perhaps I should mention for the benefit of the western members, that there is one if not two models of combines imported from Klaus. I am not sure if Ransome has imported a few in here. This is all outside the confines of Canadian manufacturers. Have I answered the question?

Mr. EMMERT: Yes.

Mr. RAPP: It is stated here in the brief that over a period of 11 years since 1949 the favourable net balance from the sale of Massey-Ferguson machines in the United States resulted in a profit of \$460 million.

Now, these Massey-Ferguson machines that were sold in the United States—were they wholly manufactured here in Canada from Canadian materials and assembled here in Canada by Canadian people, or were these parts mostly brought in from other countries and more or less assembled here in Canada. Could you tell us about that?

Mr. EMMERT: I am delighted to reply to that question. The \$490 million we referred to would be composed of practically 100 per cent Canadian content in terms of both materials and labour. The only variance would be during the period of shortage of steel in North America when we had to scramble for steel in whatever market we could buy it. But that would be in insignificant portion.

The products that would be included in terms of volume to standing order, would be, certainly, combines manufactured completely in Canada, except for the engines, which are imported from the Chrysler Corporation. They do not make them in Canada.

There may be a few accessories on the combines in that same class. Balers would be the next important thing manufactured only in Canada, again except for the engines on the power driven models. The baler tools are manufactured in Brantford and Woodstock; rakes and mowers.

The specific answer to your question concerning \$490 million would be based almost entirely on purely Canadian content.

Mr. RAPP: This is over a period of 11 years. Is the trend increasing, or, in other words, will the balance become more favourable as times goes on? Will the sales increase to the United States, or is it only over a period of 11 years? I would be very much interested to know what the trend is at the present time, 1960-61.

Mr. EMMERT: May I refer you to page three of section B.

The table on page three indicates that for 1949 we manufactured \$81 million worth of goods in Canada, of which \$36.6 million were sold in the United States.

In 1960 we manufactured \$92 million worth in Canada, of which \$58 million worth was sold in the United States.

Our judgment on your question would be that the proportion of Canadian manufactured goods sold in the United States would increase, because we are in a relatively weaker market position in the states than in Canada. The United States, as I pointed out yesterday, is a market eight times larger than Canada.

Our major endeavour in this North American unit that I am responsible for is to maintain and improve our position in Canada marketwise, certainly, and it is of vital importance, the improvement of our market position in the United States.

Mr. RAPP: That is very noble. I appreciate it.

Mr. KINDT: May I ask a supplementary question: Have you any figures on the net position of the Massey-Ferguson company on sales, or should I say on your manufactured farm equipment which flows back and forth across the

line? What I am interested in finding out is the net position. We have the \$490 million figure of which you have said a certain percentage was manufactured in Canada and shipped to the United States.

How much came in from the United States? What is the net position with respect to the movement of both machines and parts?

Mr. EMMERT: Mr. Kindt, the \$490 million is a net figure that has been arrived at by the deductive process. Again, on page three for the years 1949 and 1960 you will find that of \$47.7 million of sales in Canada in that year, \$19.9 million were of United States manufacture, and \$27.8 million were of Canadian manufacture.

In 1960 out of sales of \$50 million, \$31 million were manufactured in Canada, and \$19 million were manufactured in the United States. But the \$490 million is a net figure. I am sorry, I mean the \$460 million. We are getting confused. \$490 million was last year's sales.

Mr. KINDT: Would that figure remain about the same if it were brought up to date, let us say, for the year 1960?

Mr. EMMERT: The 1960 figure is shown on the table on page three, Mr. Kindt. The figure for 1960 indicates that the dealer imports from the United States remained fairly constant as related to 1949. The improvement in our Canadian sales came wholly from Canadian manufacturers.

Mr. GUNDLOCK: Mr. Chairman, I wonder if Mr. Emmert would answer a question I asked yesterday. Simply what I wanted was component costs—if you like to use that word—the actual price contained and possibly in the manner that most of us are used to seeing prices across the country, for instance, at budget times, which is high in certain costs. I recall the conversation yesterday and in so much as they operate a world company, I would prefer, as a matter of fact, to have from the Canadian company or the American company or any other company, as a matter of fact, for reasons of comparison and also—and I want to make this clear, I do not want to split any hairs on this at all, good approximate figures would be all I would like to have, and possibly in addition to them, if it is not too much trouble, maybe the same thing for a year or two previous, maybe back as far as ten years, five years, and now, to show any possible trends in any of these certain figures for components of the final price.

Mr. EMMERT: Is this the question?

Mr. GUNDLOCK: Yes.

Mr. EMMERT: I must say that I appreciate Mr. Gundlock's recitation of the conversation yesterday, but I am not really understanding the question.

Mr. GUNDLOCK: The question simply is this: could this committee have the components, or whatever you want to call them, that the price itself consists of? I could list transportation, capital assets, steel, wages, salaries, profit and so on down the line. I would like to see that broken down into percentages actually of the price, and in one or two instances, possibly three periods, so that we may see a possible trend in any of these figures.

Mr. EMMERT: Mr. Chairman and Mr. Gundlock, there was a lot of time spent on this general subject yesterday which I have classified as a prospective or suggested investigation into the entire internal cost structure of our company. I stated yesterday as flatly as I could that if we were forced to reveal that sort of information it would be to the advantage of our competitors. I state that again today. I indicated to you yesterday that in accordance with the terms of reference that we received, the letter which we received, we had no inkling that the committee wished to investigate the internal affairs of Massey-Ferguson. I also indicated to you yesterday that I was confused as to what the committee really wanted. Incidentally, I would not want you

to think, Mr. Chairman, that I am speaking entirely from yesterday's memory. I had the opportunity this morning to read the entire transcript, and at this point I should like to commend your staff, Mr. Chairman, on an excellent job. I found only one significant variation—from what I said, at any rate. It had to do with the dividend rate of the company which appeared in the transcript as a 40 per cent per annum dividend. Our shareholders would be very happy if that were the case.

I have a suggestion in accordance with your resolution—which has not yet been delivered to us, and which we would want a chance to study and consider if we receive it. In the light of that resolution, I would suggest that the chairman appoint the Department of Agriculture economists to define precisely what is being requested by the committee. I am sorry that from the definitions which have been given I cannot even begin to understand how we might provide the information, if the information were available. I hope, Mr. Chairman and Mr. Gundlock, that I have made myself clear.

I am more regretful than I could possibly express that we have not been able to provide the committee with information that they sought on this particular matter. I do not know if we can do so even, after it is precisely defined. I would be inclined to feel that a precise definition is of the utmost importance. I would be inclined to feel that if the committee chose to request that kind of internal information from any one company they should be prepared to assure that company that all other purveyors of farm equipment in Canada would be required to submit exactly the same information. I am not speaking of those who manufacture in Canada. If it is limited to those who manufacture in Canada, what we are in effect doing is penalizing those who do so. There is a suggestion, Mr. Chairman, for your consideration.

Mr. GUNDLOCK: Mr. Chairman, I am sorry if I have misunderstood things, but it was my understanding that the road blocks had been removed that were in the way of the answers to these questions. I would like to reiterate what I said yesterday, and that simply is this. I fail to see how we can investigate the price of farm machinery without having components of that price. Personally, if we cannot do that, I think we are wasting our time. If I might be allowed to do so, Mr. Chairman, might I ask the question of our economist whether or not he thinks that is a reasonable approach or attitude to take.

The CHAIRMAN: What I would suggest, Mr. Gundlock, is this. I have a suggestion here. It probably could be dealt with by a subcommittee. I would hope that the committee would agree to proceed with the questioning of witnesses in the same manner as was done before that question again arose. We dealt with that pretty thoroughly. I endeavoured to explain the duties of the committee before we started today, as to what duties were assigned to us, the powers we had, if necessary. I hope that could be discussed at a later date by a subcommittee, and then, if necessary, by the general committee.

Mr. HORNER (*Acadia*): I want to rise on a point of order. That question was dealt with fully. There was a motion put and it was passed. Now, if the committee wants to put another motion to get all these machine companies back, off the hook, so that they can hand into this committee any generalized statement, one can prepare a report which is nothing in common farmers' language but a bunch of b.s.; but if we want to get down to the meat of the problem, we have to take the costs analysis taken and prepared by every machine company that puts its product on the market. The motion which has been passed will do that. I do not think this should go to any other committee that could suggest any change. If the committee decides they want this information and if Massey-Harris, John Deere or Cockshutt do not want to give it, we can deal with that situation when it arises.

The CHAIRMAN: It was the definition in Mr. Emmert's suggestion here, that we ask our Department of Agriculture officials to define our order of reference. That is what I am referring to in the motion dealt with yesterday.

Mr. NASSERDEN: I think Mr. Emmert had a very good suggestion, that our economist might outline these things we might be interested in so far as the cost and prices of farm machinery are concerned. I do not think we can pursue it at the present time because it is obvious they have not got that information here and there is a lot of other information we would like to have. Maybe we can follow along that other line and have them back at a later date.

Mr. GUNDLOCK: Mr. Chairman, just one more word. Mr. Emmert took a stand yesterday on the subject of cost analysis. I want to make it perfectly clear that I only want the components of the price. Maybe I am not putting that in good language or using good grammar but I want to make perfectly clear, Mr. Chairman, what it is that I want. I am not asking for a cost analysis at all—I am asking for what I call components. Might I ask the economist here if I am using the proper wording—components of farm machinery price?

The CHAIRMAN: Is it the wish of the committee that Dr. Haase be heard on that?

Dr. HAASE: I would not say anything else at this stage, except that if it is your wish that such a statement be prepared we would want to have an opportunity to learn what the wish of the committee was.

Mr. GUNDLOCK: That is what I am trying to explain.

Mr. PETERS: I would suggest that Massey-Ferguson were not prepared to give us this information yesterday because probably their understanding and our communication with them did not indicate that this particular could be asked for. It is a particular that has been given in the United States and in Canada in previous meetings, and I think our resolutions will obtain it from Massey-Ferguson. I do not really think there is any point in rehashing it and trying to get it out of them today, because I do not think it is fair to ask them to do this on the basis that yesterday they learned of our intent and today we are asking the same question. Also, Mr. Chairman, I think a very valid point has been raised in respect to the fact that we may have been lax in the committee—and I am on the steering committee and therefore partly responsible for this—that if we want the component price of a tractor, for instance, then we are being unfair if we only ask three or four of the companies that are manufacturing that particular type of tractor. I think we are going to have to apply this to all the companies manufacturing that kind of a tractor. If it is a manure spreader, we want the price for it and we are going to have to use the list that was given to us today and get this type of information from all the companies. It is also very clear, Mr. Chairman, that every member of the committee knows that if this committee is going to produce the results that we hope for, then we are going to have to have these particulars Mr. Gundlock is asking for broken down to dollars and cents so that the farmer and we can understand it. The only stipulation, I think, that has been valid has been the one made by the vice-president in relation not only to his company to supply this information but that all the companies in similar manufacturing positions should supply this information. The committee will then have to give consideration to those who import on a manufacturing basis. I think I would suggest that this part of it should be referred to the steering committee for action in summoning these companies to provide this type of information.

Mr. EMMERT: Bearing on what Mr. Peters has just said, and I am only reciting this so that the committee will understand that if they pursue the resolution they passed in respect of all the companies who sell goods in Canada—and that would be my hope, if you pursue it, that the only fair

thing would be to do so,—if you pursue that course, then it seems to me that your advisers are going to have to sell you that not only must a precise definition be arrived at, but that then those definitions will have to be compromised as between companies, because as we explained yesterday, each company has a different method of internal organization, internal structure and internal cost accounting.

So at this point you are not only seeking advice from the economists as to the component definition of the information you want, but I think you are in a position of appointing a staff of auditors to arrive at a common definition as between companies. There has been a great deal of reference made to the book that Mr. Horner has which relates to 1937. The year 1937 was about a quarter of a century ago. Many things have changed since then, but even in those simple days—the complication of the information in that book on the part of the government and the companies, and my memory says there were auditors appointed by the government to obtain this information—even in those simple days this was a matter of months. It is conceivable that the compilation by the companies, after all the definitions and the compromises had been made and agreed to, would take a year to a year and a half at the end of which, I must repeat at the risk of again incurring the wrath of the committee, the information you would have would not be meaningful in the context in which you hope to use it.

Mr. PETERS: Mr. Chairman, the vice-president is very well trained. Would he give us an indication—I think all in this committee agree on one thing, and that is that we want to know about a tractor and we want to know how much of its overhead and how much of its labour costs and material costs and profit on the manufacturing level are. We are also interested in the distribution, the profit and the costs that are involved, and we will get that some place else. We cannot expect you to provide it. But I think that generally what the farmer wants, anywhere across the country, is to know this. Could the vice-president tell us any other way than through the type of committee report that was arrived at in 1937, how this could be arrived at? I am aware of the fact—I am not an economist and do not understand it very well—that you can as a company play around if you are only dealing with the committee. You can play around with such things as a design and the amount of money that goes into it and the percentage of development, and how much you spend for testing, and how much is spent for many of the things that are pretty intangible in some cases. Can the vice-president suggest any other way that we can get this type of information? I think the committee is going to serve no useful purpose unless it can get this type of information. We are all agreed we are going to get this type of information even if we have to use very strong methods of getting it. I know the vice-president is much more familiar with the accounting set-up and the arrangements that could be used, and maybe he would make some suggestion as to how we could arrive at what we want to without using this process?

Mr. EMMERT: Mr. Peters, one of my principal jobs is the containment of costs. I really have two jobs after the selection of people: one is the containment of costs and the other, equally important, is to conduct our company's affairs so that we have the greatest possible penetration in the markets we serve. These are the two primary management jobs. I cannot determine to my satisfaction the kind of information that you are now seeking from us even for my own personal use. It is simply not possible to put the components of cost as they have been referred to here on a comparative basis over a period of time. Too many things change. First of all, and I alluded to this very briefly yesterday, for various reasons we either buy more or less of a machine outside our own factories. That in itself has the result—

Mr. NASSERDEN: That is one of the things we want to know—how much you buy outside.

Mr. EMMERT: May I continue, Mr. Chairman?

The CHAIRMAN: Yes.

Mr. EMMERT: This in itself is very significant—the amount of labour that we use in our own facilities, secondly the absolute amount of production we are privileged to produce each year very significantly and which has a marked effect on the relationship of labour to the sales dollar. These are not constant things. I attempted to state yesterday as clearly as I could that there is relatively nothing fixed in this business except that if you do not make money you are going to go out of business.

Mr. HORNER (*Acadia*): The whole discussion is absolutely out of order.

Mr. KORCHINSKI: I would just like to state here this point because I spent as much time as anyone else here yesterday trying to ferret this type of information from Mr. Emmert. I was guided by the fact that the statement on page 5 said that our biggest cost elements are steel, labour and transportation. I assume that, steel, labour and transportation were the guiding factor in establishing price. He is right when he says you are empowered to inquire into the prices of machinery. We all assume here in this committee that the cost of steel, labour and transportation is the guiding factor in establishing the price. I think that is where we are perhaps wrong, and I think—if I may be permitted a few questions—I hope to be able to establish the fact that this is not the guiding factor in establishing any price. If Mr. Emmert would perhaps admit at the moment that this is not a factor that guides him in establishing a price, then it will save us a lot of trouble. Would you make a statement on that, Mr. Emmert?

Mr. EMMERT: I certainly would, Mr. Korchinski. As a matter of fact I had a lot to say on the other question before I was interrupted. On the one hand, we stated in our brief that the emphasis we placed on demand in pricing our products is no denial of the importance of cost in our business. This importance is in terms of the internal adjusting of our operations. The costs must be met over a period of years.

We stated in our brief that our prices are largely the result of the conditions in the market place. Someone attempted to have me say that our prices were set by our competitors. We did not say that and we deny it. We have not said in this brief, nor before the committee, that the cost of doing business, including labour, material and all other elements of cost, did not establish the price of farm machinery. As an industry, it cannot help but do so. My brief pertains to Massey-Ferguson, but, as an industry, Mr. Korchinski, the cost certainly would be, to a large measure, the price. Now, we are in the unfortunate position, for one reason or another, of incurring higher costs than some of our competitors. Therefore, we do not make as much money. We are trying to overcome this deplorable situation, and we are doing our level best to overcome it.

Have I answered your question?

Mr. KORCHINSKI: Well, are you finished?

Mr. EMMERT: I am, at this point.

The CHAIRMAN: Gentlemen, I think probably this discussion has reached the point where the chairman should rule on it. At this time I think we should proceed to the questioning of our witnesses as it pertained to 15 or 20 minutes ago. The next member on my list is Mr. Horner.

Mr. HORNER (*Acadia*): Mr. Chairman, my question dealt with—

The CHAIRMAN: Before you commence, Mr. Horner, may I say that we have been sitting here now since two-thirty. It is now almost a quarter to five and,

if the committee is not able to finish by five o'clock, would it be agreeable that we adjourn at that time and come back at 7.30 this evening?

Some Hon. MEMBERS: Agreed.

The CHAIRMAN: Then, that will be fine. We will adjourn at 5 o'clock.

Mr. HORNER (*Acadia*): Mr. Chairman, my question stems from page 1 of section B, regarding sales. It states that 12½ per cent of Massey-Ferguson sales were in Canada. I realize, from their financial statement, that 45 per cent of their sales are in tractors. Does this hold true of Canadian sales, relatively speaking?

Mr. EMMERT: I do not think so, Mr. Horner. We were looking at the exhibit that Mr. Kindt referred to a little while ago, and it showed there, as I recall it, that \$19 million of our sales in Canada were from the United States, and that would be tractors, plus those we import from the United Kingdom, and, the balance of the sales, \$31-odd million were in Canadian manufacture, which would exclude tractors. I think the evidence from that table would indicate that the ratio in Canada is probably not that high.

Mr. HORNER (*Acadia*): About one-quarter.

Mr. EMMERT: Have you any idea on that, Bill?

Mr. FORSYTH: I regret, Mr. Emmert, to say that I cannot even give you an estimated figure, although I must admit I should be able to. It should be, I would think, slightly less than 45 per cent, though, of the sales dollar.

Mr. EMMERT: The Canadian market, because of the west, takes a greater preponderance of combines.

Mr. HORNER (*Acadia*): That is what I wanted to know. Another question: When did Massey-Ferguson buy out Standard Tractor in Great Britain?

Mr. EMMERT: The arrangement to purchase Standard Motors was consummated about mid-summer, 1959.

Mr. HORNER (*Acadia*): I have a further question in connection with this same matter. Could you, through your figures, supply this information to us? You cannot do it now, but perhaps you could do it at a later date. I am going to admit quite frankly what I am getting at. I am trying to determine, for my own sake, as well as others, what percentage of the Canadian market Massey-Ferguson captures. I know, last year, there were 26,000 tractors sold in Canada. What is the number of tractors sold by Massey-Ferguson in Canada last year?

Mr. EMMERT: We would be delighted to give it to you.

Mr. FORSYTH: I am unable to give it to you to the unit.

Mr. HORNER (*Acadia*): It would be all right if you could give us an approximate figure at a later date.

Mr. FORSYTH: The exact figure can be given to you.

Mr. EMMERT: Let us define this. Do you seek information as to how many tractors we sold to our dealers, or how many tractors were sold to the retail customers?

Mr. HORNER (*Acadia*): It really does not matter to me. I will accept whatever figure you can produce the easiest.

Mr. EMMERT: But, I am going to produce a figure in relation to the one you quoted. What is that figure?

Mr. HORNER (*Acadia*): The number of retail tractor sales.

Mr. EMMERT: We will provide retail information.

Mr. HORNER (*Acadia*): I ask this, because I think that it is more and more evident that because of the number of machine companies listed a while ago, that the committee is aware of the exact position of the major companies that come before it.

I have a further question I would like to ask along the same line. When Massey-Ferguson took over Standard Tractors, was Standard Tractors then making the Massey-Ferguson tractors 95, or what they call the 95 now?

Mr. EMMERT: No. The Standard Motor facilities which Massey-Ferguson purchased were devoted exclusively to the model 35 and, to a limited degree, components for the model 65.

Mr. HORNER (*Acadia*): Then, just to clarify this a little further, could you tell me why, about two years ago, all of a sudden—and I think it was the G.B. Minneapolis line—the paint was switched from yellow to orange, and it became the Massey 95.

Mr. EMMERT: I can explain that very simply. Massey-Ferguson has not had time to develop in its own laboratories, and through its own research, a tractor in the horsepower span of the Minne-Mo to which you referred. We made an arrangement with Minneapolis-Moline to have them alter their tractor to a minor degree, to put our paint scheme on it, and to sell the tractor to us and we would then distribute it through our dealers in Canada. We were not able to make these same arrangements with Minneapolis-Moline for our United States market and, therefore, we made a similar arrangement with the Oliver Company for their large tractor.

Mr. HORNER (*Acadia*): This is quite interesting. I wanted to draw the committee's attention to this. The reason I asked that is because evidence has been given before the committee that competitive prices have a great deal to do with where machine companies set their prices. Now, in a sense, the big tractor is sold by two of the larger machinery companies in Canada. They are selling the same tractor and, I might add, for the committee's information, that they retail at almost the same price. I do not know what the base price is, as set by the machine company. This is an important point, and I think it bears out the fact that we should have perhaps broken down your figures on tractor sales between the 35, 65, 85 and 95. What I am trying to get at is this: Are market prices determined by a free fluctuation of demand and competitive prices?

Mr. EMMERT: May I reply?

Mr. HORNER (*Acadia*): Yes.

Mr. EMMERT: The economic facts on our distribution of this Massey-Ferguson 95 are really quite simple. We made the best possible purchase that we could with Minneapolis-Moline. I know perfectly well if we priced it substantially over the Minneapolis-Moline which they sell in Canada we might as well forget it. So the considerations of the established market price impinged on us at the top and what we had to pay for the tractor impinged on us at the bottom. The real benefit to Massey-Ferguson in offering this tractor to our customers is in respect of satisfying a need of our dealers in offering to their customers, who want a big tractor, a big tractor. The economic benefit of operating that way obviously is not very attractive. Otherwise many people would attempt to engage in the same thing. The only reason we made a deal with Oliver in the United States is for exactly the same reason, on behalf of our dealers in the Great Plains.

It follows that unless a dealer has a full line of products to offer his customers he is not going to warrant that customer's trade. The facts are all very simple. If you have in mind that Massey-Ferguson and Minneapolis-Moline enter into an arrangement whereby they will manufacture the big

tractor and we will manufacture the little ones—we sell their big one and they sell our little one—I can assure you the thought is not valid. Let me state further to the committee that for the last three and a half years we have been in the throes of developing a tractor with all of the Massey-Ferguson features on it which farmers have come to like and which would compete in this horsepower range. When we are successful in developing it, we will no longer have any need for the Minneapolis-Moline. They know this full well. The arrangement to which you are referring is not unusual. This year Ford marketed a combine which was built for them by Oliver. This is standard practice.

Mr. HORNER (*Acadia*): That may be true. I hope you will see fit to give me the figures on your tractor sales broken down so that we will know whether or not perhaps thirty-three per cent of the tractor sales are controlled or set by this one machine.

Mr. EMMERT: Once again the information you are asking me for is a very closely guarded competitive secret. Our competitors would be delighted to know how many 35's Mr. Forsyth was able to sell, also how many 55's, 65's and 85's. They would like to know this in the most intimate detail. We would like to know from our competitors. This information is known to only a handful of people in our company. I think it would be unfair of this committee to attempt to delve into competitive information.

Mr. HORNER (*Acadia*): Well, Mr. Chairman and Mr. Emmert, I have one further question along this same line. When you start talking about competitive reasons I suggest that the table which you have here, exhibit VIII, certainly gives the competitors some advantage in knowing what the cost to Massey-Ferguson would be on a Massey-Ferguson 35. It is \$1,864. If I were in the tractor business this to me would be a pretty competitive thing.

Mr. EMMERT: May I point out that this \$1,864 to which you refer is duplicated probably over ten thousand pieces of paper. We obtain this information on all of our competitive products by the simple expedient of going to any one of their dealers and pricing the products. This cannot in any way be considered as being a competitive piece of information. This is public knowledge if any one cares to go and seek it.

Mr. HORNER (*Acadia*): Here is a tractor which because of its size is in a class by itself, the Massey-Ferguson 95. It is one of the biggest tractors on the market. I think it is evident that the tractor now is being sold by two of the reasonably large sales distributing people in western Canada particularly and all across Canada. This tractor now is priced at a retail price at approximately the same level—in fact I would not be a bit surprised if they are within \$25 of one another. I have a very good knowledge of this because back in 1957 I nearly bought a GB Minneapolis 95. I priced it and considered it very very seriously. Instead, I will have you know, I bought a 555 Massey. Shortly after I purchased it Massey took over the GB line. I went in and asked what it was selling for—\$5,600 some odd. It was so close to what the Massey-Ferguson dealer had told me that it was not funny. I would suggest that there is very good information which this committee might have in determining whether or not there is a free flow of competition in setting the price levels. I do not know. Maybe this tractor in this series commands eighty per cent of the market. I do not think it does; but it might command eighty per cent of the market. If it did, then this tractor would set the price for that size of tractor. Therefore, I think it is very pertinent for the committee to know how many of these Massey-Ferguson machines were sold last year and we could ask the other companies who will appear before us how many of their tractors in the same class were sold.

Mr. EMMERT: The question has changed a little bit. In the first place I am delighted, and I am sure Mr. Forsyth is, to know that in the tractor class in which we have been competitive with the Minne-Mo tractor we are presumed to be getting so much of the business. That is fine; but I would like to call to your attention the fact that there are many other competitors in that particular class—the 4010, the new Deere has taken that power class by storm in the United States; then there is the 900 Case, and International Harvester would be very sad if they were left out of this particular class.

Mr. HORNER (*Acadia*): I agree.

Mr. EMMERT: And there are a number of others.

Mr. HORNER (*Acadia*): The Oliver.

Mr. EMMERT: Yes. What you really asked me was for competitive information.

Mr. HORNER (*Acadia*): I do not think it was.

Mr. EMMERT: What you later indicated you wanted was the number of Minneapolis-Moline tractors sold by them and by us in Canada, on the grounds that you would get the same information from the other people who sell similar tractors.

Mr. HORNER (*Acadia*): Yes.

Mr. EMMERT: We are quite prepared to tell you how many Minneapolis-Moline tractors we have sold in Canada. I am not prepared to break down for you our complete tractor sales.

Mr. HORNER (*Acadia*): That is fine.

The CHAIRMAN: We agreed to adjourn at 5 o'clock, but before we do Mr. Forsyth has a little additional information he wishes to give the committee.

Mr. SOUTHAM: There is one thing I would like to get on the record before we adjourn. We have been dealing in the brief with appendix I, and while this discussion has been going on I have been looking at the annual report and the financial statement of Massey-Ferguson. I find there is a lot of pertinent information in it relative to the discussion. I would like the permission of the committee to have this financial statement incorporated in the proceedings of this committee.

Mr. HORNER (*Acadia*): Agreed.

The CHAIRMAN: The committee is agreeable..

Mr. KORCHINSKI: Provided we are permitted to ask a few questions on this annual report.

The CHAIRMAN: Yes.

Mr. FORSYTH: Mr. Chairman, out of deference to the province of Quebec, when I was reciting the members who compete for the farm implement dollar in Canada I did not mention the Forano people in Quebec. There also are some smaller implement manufacturers in that province. The names of them escape me at the moment, but Forano is a respected member of the farm manufacturing community in Canada.

The CHAIRMAN: We will meet in this room at 7:30.

EVENING SITTING

TUESDAY, May 2, 1961.

The CHAIRMAN: Gentlemen, will you come to order. I have a few remarks to make at this time concerning our proceedings of this afternoon. Although Mr. Emmert this afternoon or yesterday heard the two resolutions which were passed by this committee yesterday, and his official asked for and obtained

copies of same, this afternoon in his evidence he stated: "if and when we are advised of these resolutions we will consider them."

I am now handing Mr. Emmert a letter signed by me which advises him of these resolutions.

I will ask Mr. Lyons to read a copy of this letter.

THE CLERK OF THE COMMITTEE: To Mr. T. J. Emmert, vice-president, Massey-Ferguson Limited.

Dear Mr. Emmert:

Yesterday, Monday, May 1, 1961, the standing committee on agriculture and colonization gave assent to two (2) resolutions, regarding machinery companies, in relation to the inquiry into farm machinery prices.

From the official minutes of proceedings, they read:

No. 1: Mr. Horner (Acadia), seconded by Mr. Gundlock, moved that this committee request all machinery companies appearing before this committee to supply by years, from 1954 to date, a cost breakdown of the material, wages, salaries, and distribution which go into the manufacture of such items as tractors, combines, manure spreaders and balers.

No. 2: Mr. Horner (Acadia), moved, seconded by Mr. Milligan, that all machinery companies appearing before this committee present figures for the years 1954 to date regarding numbers of employees in each of the following categories: administration, production and distribution and that they give aggregate amount of wages paid in each case.

These are passed to you for your information and guidance.

(sgd.) James A. McBain,
Chairman.

The CHAIRMAN: Mr. Emmert, I will pass this on to you.

This afternoon at adjournment we were discussing section B, and before adjournment I was about to recognize Mr. Southam. Have you some comments to make at this time?

Mr. SOUTHAM: Mr. Chairman, prior to adjourning I asked the permission of the committee to have incorporated in the proceedings the annual report and financial statement of Massey-Ferguson Company, and it is on the basis of some facts in this report that I wanted to base my next question. I am referring to section B, pricing and financial aspects. There is a statement here in which I am interested. We have had a discussion on it but I want to relate it to the statement that Massey-Ferguson's net income on world wide operations amounted to 2.7 per cent of each dollar of sales. In turning to the financial report I think there is some very valuable information as far as world wide operation is concerned. We could look at it for a moment. I would like to read some of these figures into the record. It relates to the financial review and sales on page 10 of the financial report. It is dealing in general with the sales in Canada, the United States, England, France and Germany.

Consolidated sales of \$490,413,988 in 1960 were 3 per cent higher than the previous record level of \$475,543,641 reached in 1959. While declines occurred in certain major markets—notably the United States and France—gains in other areas, coupled with a full year of Perkins groups sales, resulted in a net increase of \$14,870,347. Details of sales by territories are shown on page 22.

In the United States, some lessening in retail sales of farm machinery, with a consequent program of balancing the mix and levels of dealer inventories, resulted in a decline in wholesale sales of 10.9 per cent from 1959. In Canada, however, the market was buoyant, and sales to dealers increased 11.2 per cent.

Conditions in Australia were again favourable in 1960, and a gain of 23 per cent over 1959 was achieved.

In France, a decrease of 12 per cent from last year reflects another year of unsettled conditions in the agricultural industry and the lack of a full range of tractors to meet European market requirements—a situation which will markedly improve with the introduction of the new MF 825 tractor.

Excluding the effect of Perkins sales, 1960 sales in the United Kingdom decreased 21.8 per cent. Including sales of the Perkins group, a decrease of 5.4 per cent was recorded.

Total domestic and export sales of farm machinery and diesel engines from our operations in the United Kingdom increased by 14.7 per cent over last year, with export sales at record levels.

Sales in Germany increased 34.8 per cent over 1959 in a generally favourable economic climate.

I could read on, gentlemen, but that gives me a basis for my question. My question is this, Mr. Chairman: does this 2.7 per cent net income that you refer to on page 10 of the general statement give a true reflection as far as our inquiry is concerned, with profit by Massey-Ferguson in Canada? The point I am trying to make is whether Canada, according to the record here, is bearing a bigger load of the over-all general sales profits than they should? You could refer to the financial statement as far as the dividends declared by Massey-Ferguson are concerned. I would like you to correct me on this, but the sales value of Massey-Ferguson, are there common shares at \$14?

Mr. EMMERT: The last time they were \$13½.

Mr. SOUTHAM: Around \$14. It appears to me that the company has been doing a relatively good business here in Canada, and I am just wondering if your Canadian industry is carrying more than their fair share of the total economic load across the world wide operation.

Mr. EMMERT: There are two points I would like to make. Very early in our appearance here before this committee I pointed out that we operate in the North American market. There is no such thing as a Canadian farm equipment industry producing in its entirety for the Canadian farming market. This is a North American market. As you have heard, our production is integrated on this continent, and is supplemented by imports of certain items from United Kingdom plants. Therefore, the ups and downs of the United States market or the Canadian market obviously have a bearing on the operations within this continent. But more important than that, I would have to refer you to page 10 of the brief under section B under the heading of profits:

The problems concerning determination of profits are summed up by a quotation from page 16 of the report on the Canadian Agricultural Machinery Industry, by J. D. Woods and Gordon, Limited, dated April 1956, in connection with the royal commission on Canada's economic prospects. The quotation is as follows:

"Profits on Canadian Agricultural Machinery Companies—

It would be practically impossible to provide an accurate statement of the relative profits made by the four main companies in their Canadian operations alone."

One of the companies referred to was Massey-Ferguson. The brief continues:

"Production is integrated between their Canadian and United States plants, and different bases are used by the respective companies for determining the selling prices of the products moving between the two countries. It is equally difficult to separate profits made on domestic manufactures from profits made on similar goods when imported."

This quotation applies to Massey-Ferguson, one of the "four main companies", as much today as it did in 1956.

The testimony which was given by our company and the three other major companies to a royal commission was not given lightly. I am sure the consideration that the royal commission gave to the testimony was not light, and I could find no reason today to argue with the results of the deliberations of the royal commission as stated here.

Mr. REGNIER: There is a supplementary question I would like to ask. When you make your income tax returns for Canada, do you include all your profits made in the United States or elsewhere?

Mr. EMMERT: Mr. Regnier, we are required by the laws of the land in which we operate, of course, to submit an income tax return in respect of each company operating in that country. This applies wherever we do business. In Canada our situation is complicated by the fact that the main company, Massey-Ferguson Limited, is located—I think fortunately—in this country of Canada. Our return to the income tax authorities cannot be solely, because of that fact, an account of the transactions within the country, either manufacturing or selling. It is a conglomeration of the world-wide trade, and the net results of Massey-Ferguson and all other subsidiaries around the world because, as you noted here, this is a consolidated financial statement.

Mr. REGNIER: I wonder if you have to file a tax return for other countries as well?

Mr. EMMERT: We do indeed; we have to file a tax return in each of the countries where one of our subsidiaries operates.

Mr. REGNIER: Then, I would believe that your income tax returns for the respective countries would show the losses or profits made in each of these countries.

Mr. EMMERT: I have nothing to do with the filing of them, but I am sure you are quite right. Eventually, on the bottom line, you have to come down to the profit figure.

Mr. KORCHINSKI: Since this is a consolidated operation, would it be fair to assume that since, in your statement on page 5, of the 1960 report you state:

Earnings of the French company were not satisfactory, reflecting another year of unfavourable economic conditions,

—would it then be fair to say that your Canadian operations, or consolidated Massey-Ferguson's operations, show—what is it—about 2.3 per cent earnings on net sales?

In other words, what would happen is this: we could have shown a 10 per cent—I am just using this as an example—10 per cent, since there is only 12.6 per cent of your sales in Canada. Let us say, for example, that you probably can give us the correct figures here. You can show a 10 per cent profit on Canadian sales, yet because you had countries like France, or other countries—how many countries do you sell in? Is it 42?

Mr. EMMERT: One hundred and forty-two.

Mr. KORCHINSKI: Oh, I am only 100 out. You have much more room for losses in there. The point is this: that since you could make a loss in all these countries, and the fact is that Canadian sales have been profitable to the com-

pany, would it be fair to assume that because some of these other companies have been taking a loss or showing a loss, you have been in fact subsidizing operations in those other countries?

Mr. EMMERT: Mr. Korchinski, I must once more refer you to the studied results of the royal commission of this industry. We have not attempted in our annual report to delineate the profits in any particular country derived from the operations in that country.

We feel that we have an obligation to our shareholders to advise them where our trading affairs are not going as well as we would hope them to go. This is the case in France.

I should also call to your attention that our net profit which we are talking about in the past few years, is benefited from a tax credit from the United States government which has no bearing on our business in Canada at all. It is a very substantial tax credit.

This resulted from losses reported by the United States company in years gone by. I simply cannot add anything to the profitability by countries other than the statement included in the royal commission report to which we subscribe.

Mr. KORCHINSKI: You say that you are vice president of North American operations?

Mr. EMMERT: To be exactly specific, I am vice president of Massey-Ferguson Limited, and my authority as officer of the company is in respect of the operations of the company within North America.

Mr. KORCHINSKI: You would then no doubt have consultations occasionally? You would have meetings with other people who are in the same position as you are, only from a different area; that is to say, for example, from the United Kingdom, you would have a director from there, and you would have consultations with him occasionally, I would presume!

Mr. EMMERT: That is quite a natural thing.

Mr. KORCHINSKI: Yes, I presume it would be. You would then be familiar with whether or not these countries are operating at a profit or loss within reason. I mean certain countries—maybe you might not know the exact figures, but you would be familiar with whether or not they are showing a profit or a loss.

Mr. EMMERT: I am not familiar, Mr. Korchinski, with the profitability with any of the operating units other than North America, except at the year end.

Mr. KORCHINSKI: But you are familiar with them then?

Mr. EMMERT: This is a principle of organization. Each operating unit is intended to stand on its own feet. We in North America buy goods from the United Kingdom operating unit. It would not be—shall we say—an arms' length transaction. If Mr. Hunt, the managing director of the United Kingdom operating unit and I combined on the price he would charge us.

Mr. KORCHINSKI: Your operations in Canada were equivalent to 12.6 per cent of the total Massey-Ferguson sales last year. Your French operations were 11.4, according to your consolidated report.

Since the French operation was apparently, from your statement, one that was not satisfactory, to use your own words, obviously the Canadian operation was 12.6, which was roughly an amount equivalent to your overall operation; could I then assume that perhaps the amount that you had earned in Canada was offset in losses by what was incurred in France?

Mr. EMMERT: You could not assume that, Mr. Korchinski.

Mr. KORCHINSKI: Have you any reason why you should say that?

The CHAIRMAN: Mr. Korchinski, I believe you interrupted Mr. Southam in his line of questioning.

Mr. SOUTHAM: I am still not satisfied with the statement on page ten of your 1960 annual report. The Massey-Ferguson net income after taxes in 1960, on world-wide operations, came to 2.7 per cent on each dollar of sales. That is a general statement. Taking for granted that this is based on the facts given in the annual report here, I would like to refer now to what I referred to a minute ago. The earnings per common share, including the tax credits are 32 cents. I wish you would explain what this tax credit of 32 cents is? What is this benefit?

Mr. EMMERT: This accrues primarily from the United States government. For a number of years our United States wholly owned subsidiary, Massey-Ferguson Incorporated, operated on a basis that caused us to report losses to the income tax people in the United States.

Their income tax laws allow a corporation, as in this country, to carry forward tax losses, so that we in effect—we are not required to pay a tax on profits that we earn in the future, within the limit of the law.

The effect of that in 1960 was that whatever the amount of money we earned in the United States, it was not taxable under the laws of that land to the extent of the credit.

Mr. SOUTHAM: Then, Mr. Emmert, the earnings per common share in 1960 including this 32 cents of tax credit amounted to 97 cents per common share; in other words, providing your stock was worth about \$14 or \$13.75, that would indicate a dividend of about 13 per cent, roughly.

Mr. EMMERT: No. I think you are referring to the earnings per share. The dividends per share, as I recited yesterday, were 40 cents per share.

Mr. SOUTHAM: Well, of course, you would be assessing some of that for capital reserve and so on. The earnings then were thirteen per cent roughly. I am trying to relate that figure to your 2.7 cents on each dollar of sales. I am not an economist.

Mr. EMMERT: There is absolutely no relation, except by arithmetic: If our shares had been selling as they were a year ago at \$8 a share, the ninety-seven cents would represent about twelve per cent per share. That really is not a significant figure. The 2.7 cents relates to the earnings per dollar on sales.

Mr. SOUTHAM: The point I was trying to get clear is that in looking at your financial statement I see you have a profit. I am glad to see the profit. It looks as if they have done exceptionally well under the circumstances, taking the overall world-wide operations into consideration.

Mr. EMMERT: I am delighted to hear you say that. I hope you are a large shareholder, because we like to have the people feel that way. Actually we are completely dissatisfied with the profit performance of our company. Our chairman has said that in not unmistakable terms. Our president has said it. I have said it to our own organization, and I have said it quite clearly in this brief to you. We are completely unhappy with the profitability of this company. It is not even in keeping with the profitability of other major competitors.

Mr. KORCHINSKI: What do you say would be a fair return for your company?

Mr. EMMERT: I wish I could answer your question factually, in a way which would satisfy you, and in a way so that the answer could not change. This is a question which I ask myself all the time. It is a question asked of me by our board, by our executive committee, our chairman and our president. The only answer which I think any employee can give is that it depends entirely upon the circumstances in which you operate.

Mr. KORCHINSKI: Certainly as a Canadian I would not like to see you working on a margin, on a level where you are up and down certainly not. It seems to me, however, that since you are not prepared to state what you would like to have as a fair return, provided there is a profit you are prepared to keep operating.

Mr. HORNER (*Acadia*): Of course that is only logical.

Mr. KORCHINSKI: No.

Mr. EMMERT: I think there comes a time when the shareholders of a company are inclined to question the wisdom of continuing to operate, even though the company has operated at a profit. There comes a time when the shareholder is better advised to put his money into government bonds where there is no risk and he has a guaranteed return. This is not the case when a shareholder invests in a public company.

Mr. KORCHINSKI: Since the United States farmer obviously is subsidized to a greater extent by the United States government it would be fair to assume they are in a better position to pay more for their products. Somewhere in the brief you state that you would like to see the return greater to the farmer. You would then naturally think that is a more profitable area for your sales, would you not?

Mr. EMMERT: Mr. Korchinski, I do not have information available to me which would allow me to agree or disagree with your statement.

Mr. KORCHINSKI: But you are quite prepared—

The CHAIRMAN: I would remind you that you are getting into the internal operations of the organization.

Mr. KORCHINSKI: I am merely referring to portions of the brief. If I am not in order, then I would like to be told.

The CHAIRMAN: I recognize Mr. Milligan.

Mr. MILLIGAN: Mr. Chairman, I noticed in the findings of the farm forums a criticism about small parts which are worn out and which you cannot buy without buying the whole assembly. I have found that to be the situation in respect of some of my machines such as manure spreader, the power take-off on the power spreader where there is a little bearing which is worn out. You have to buy the whole assembly. Is it the choice of the dealer that they do not keep those parts, or is it company policy?

Mr. EMMERT: The policy of the company is as we have stated, and that is to stock any part or any assembly for which there are sales, or to stock in accordance with the laws of the province or the state in which we operate. I cannot state other than that. That is our policy. If you have a specific example on a Massey-Ferguson machine, we would be delighted to give you more information as to whether it is possible or otherwise.

Mr. KORCHINSKI: I have an example. I went to the trouble of trying to get hold of some information. On a fourteen inch plowshare the price is \$8.35. The tachometer, which I think you will agree is a little more complicated, sells at \$18.35. The axle on a landwheel one-way, which is a little simple rod, I think made of steel is \$40.50. How in the world can you justify pricing it in that fashion? A simple little mould board with a little curve in it is \$27.25. How in the world do you go at pricing these things? These are your own suggested prices.

Mr. EMMERT: Are these Massey-Ferguson parts you are speaking about?

Mr. KORCHINSKI: Massey-Ferguson I believe. The watergauge is \$4.90. I think it is far more complicated than a mould board.

Mr. EMMERT: Well, Mr. Korchinski, I would not attempt to justify the prices, as you put it. We explained yesterday our pricing policy, and there is little I can add to it. There is one thing that I would like you to do.

Mr. KORCHINSKI: I will do anything once.

Mr. EMMERT: I would like you—and this goes for all the members of the committee—to be our guest at our factories, and I will make a particular point of taking you to our Brantford factory where mould boards are made. I would then ask you to stand up on the machinery that we have paid for, and which we utilize, to make us a mould board. Perhaps then, you could understand some of the reasons.

Mr. KORCHINSKI: In other words, the cost of the machinery and the labour that goes into it are factors that determines the final price of that piece of equipment.

Mr. EMMERT: We have never denied that and, if we can cover our costs, we are fortunate; if we cannot, then, unfortunately, we have to do something about it.

Mr. NASSERDEN: Have you any formula in estimating these suggested prices?

Mr. EMMERT: You are now referring to parts?

Mr. NASSERDEN: Yes.

Mr. EMMERT: There is no formula. We stated in our brief that the 85,000 parts we maintain are under constant review. Prices are adjusted both upward and downward from time to time.

Mr. NASSERDEN: What are the considerations that are taken into account when they are adjusted?

Mr. EMMERT: Well, I would have to suggest that all of the usual commercial considerations are; competitive prices, to begin with; elements of cost, as we can account for them; how many we have on hand; historical movement of the parts; what do we expect in the future, and so on. We have a battery of people in our pricing activity who do nothing but keep under constant review these 85,000 parts.

Mr. KORCHINSKI: In reply to me, you stated you have never denied the cost of the machinery. The cost of labour and other components are factors in determining the price of that piece of, in this case, "repair". If I stated to you that you were losing money on the assembly of your baler in Toronto, could you deny that, or could you not?

Mr. EMMERT: Well, I think, Mr. Korchinski, you would have to add a lot to it before I could even reply to your question intelligently.

Mr. KORCHINSKI: If I stated that it was a fact, could you in some way or other prove that I was wrong?

Mr. EMMERT: No. Let me start off here. Would you be willing to specify when?

Mr. KORCHINSKI: Let us say for the year 1960.

Mr. EMMERT: But, you cannot do that.

Mr. KORCHINSKI: Or, 1959.

Mr. EMMERT: You cannot do that. Our baler plant runs three or four months out of the year, and for the rest of the time it is shut down; we have no balers to produce.

Mr. KORCHINSKI: As far as you are concerned, that is your 1960 operation?

Mr. EMMERT: Would you be willing to specify to me the number of balers?

Mr. KORCHINSKI: No; your total operation.

Mr. EMMERT: Now, you are going back on the same subject we were on before—our internal costs.

Mr. KORCHINSKI: If I said that you could neither prove nor disprove that statement, what would you say?

Mr. EMMERT: What are you driving at?

Mr. KORCHINSKI: At this: All I am trying to say is that you should be aware that there are certain operations that you should not be in, and that, in turn, could give you a greater return; also, there are certain operations which are subsidizing others. You cannot prove or disprove that, because you state you have no accounting.

Mr. EMMERT: Mr. Korchinski, from my point of view—and I know full well that some members of the committee do not agree with this—I am under no obligation to prove to you that our balers run either at a profit or a loss.

Mr. KORCHINSKI: Well, if you do not wish to answer me, that is perfectly all right; I just want it on the record.

The CHAIRMAN: Have you a question, Mr. Milligan?

Mr. MILLIGAN: My question concerns plowshares. Does volume make a difference in the price? I am thinking of a steel Massey-Harris share. There are some at \$8.50 and others go as high as \$15. Does volume have any effect on the pricing?

Mr. EMMERT: It has a very great effect, because one of the largest costs that any enterprise has to cover is the fixed cost as opposed to the variables. The larger the volumes, the less the fixed cost per unit. We manufacture and provide for sale a variety of shares. We have what we refer to—and perhaps some members of the committee would not agree with the terminology—as a low cost share. This is because of competition. It is not as good a share as a Massey-Ferguson standard share or some other kind, because, in terms of value, it will not last as long.

Mr. KORCHINSKI: Might I just—

The CHAIRMAN: Just a moment, Mr. Korchinski.

Mr. KORCHINSKI: Mr. Chairman, I think we left the wrong impression here. I think in your statement you stated you would like to have a greater return; I merely state that if you would perhaps investigate some of your operations, you might find that you could get perhaps a 5 per cent return on your sales, and that sort of thing.

Mr. EMMERT: Mr. Korchinski, do you think for one minute that we do not investigate all the items we can make money on, or think we can, and all the items we cannot?

Mr. KORCHINSKI: I think you do; that is the very point. That is the very fact I have been trying to establish, but apparently the information is not available.

Mr. EMMERT: Do you think any business operates otherwise?

Mr. KORCHINSKI: I have never intimated that.

The CHAIRMAN: Members of the committee, we have now spent considerably over three hours on B.

Mr. NASSERDEN: And, we are not through yet.

The CHAIRMAN: In fairness to some members of the committee who have been waiting patiently to ask a few questions on other parts of this brief, I think we should give them that opportunity. I do not want to discriminate

against any member, but some members of the committee seem to be occupying more time than others. In all fairness to those who have been waiting, would it be agreeable if we pass on to section C of the brief?

Mr. NASSERDEN: I have a question I should like to ask before we do that. Massey-Ferguson is a world-wide company and, in any given year, in some countries you may show a loss and in others a profit. Now, Mr. Emmert, would you give me your attention for a moment.

In regard to the Canadian end of your operations, you take care of what you can sell at home, and whatever you have surplus you can sell in competition with others in whatever country to which you take your product. That might mean, to some degree, a loss in breaking into a market in another country, and it would show a less favourable balance sheet so far as your operations are concerned there. Is that not a fact?

Mr. EMMERT: I hate to continue to appear dense, but is what not a fact?

Mr. NASSERDEN: Well, you have said that in France there was a decrease of 12 per cent from last year and in the United Kingdom there was an increase of 28.1 per cent, which was reduced to something like 5.4 per cent after everything was taken into consideration. You have also stated that sales in the United States decreased by 10.9 per cent, and that they increased in Canada by 11.2 per cent. Are we to take it that no action was taken to try to hold your sales, or your volume of sales in these other countries where they had slipped during the year?

Mr. EMMERT: I would assume that all appropriate action was taken to attempt to keep the sales level at the best possible rate.

Mr. NASSERDEN: Then I would think this statement, that in Canada the market was buoyant and sales increased by 11.2 per cent, was a good answer to Dick Sullivan's question, and also to Stan's question, in so far as there was a movement or a balancing of profit and loss as between the operations of your company in one country and in another.

Mr. EMMERT: I suggest you are presupposing that goods produced in Canada might be shipped to France and the United Kingdom at reduced prices in order to stimulate the markets there. From the evidence in the brief, and also from our annual report, it is evident that our sales outside of North America have been diminishing year by year. We do not produce anything in Canada for France; but this year, as I said yesterday, we were fortunate in producing 120 super 22 dieselized combines to test the market in the United Kingdom and France. That is the biggest order we have had in a long time, but the bulk of our production from our Canadian plants is either sold in Canada or, more fortunately, in the United States. I use the latter word because that brings exchange to our country. We have also pointed out that the prices to dealers in the United States are no less favourable than to the dealers in Canada. That is to say, we do not sell for less in the United States.

Mr. NASSERDEN: Then your answer would indicate to me that, on your consolidated balance sheet, there must be a levelling out of the operations as between these different countries and, while I am not asking you to say what it was, or if there was such a thing, from all appearances it seems that such a thing did take place.

Mr. EMMERT: I think it follows that when you have a number of operating units and one makes a profit and one makes a loss then, in the consolidated balance sheet of the parent company, fortunately located in Canada, there must be a levelling out.

Mr. NASSERDEN: That brings me to my next observation or question, whichever way you like to take it. Yesterday we established that your earnings of

2.7 per cent on the capital of your company represented something like 6.5 per cent. So, taking it that there must have been a loss some other place then, on the Canadian operations there must have been a greater profit than 6.5 per cent.

Mr. EMMERT: I do not see how you could take it that way, because there has been no evidence submitted to that effect.

Mr. NASSERDEN: Well there has been a pretty good indication.

Mr. HORNER (*Acadia*): What percentage of your sales, dollarwise, in Canada are received from the sale of parts?

Mr. EMMERT: I should like to be specific but, from time to time, you have said you would not accept approximations.

Mr. HORNER (*Acadia*): Fine; give me an approximation.

Mr. EMMERT: We have established a goal for parts sales. This is a sales objective, increasing with the balance of the industry as we know it, that from 18 per cent to 20 per cent of the whole goods dollar should be represented by parts sales, that is, if we are getting our share of the parts market. Unfortunately, our sales to date have not come up to this objective. If I am correct, Bill, I think they are about 15 per cent.

Mr. FORSYTH: That is right.

Mr. EMMERT: And that was in latter years. I might also say we are improving. As we improve our parts service and our ability to be competitive with other entrepreneurs in the parts field, we shall begin to see a greater share of the parts business.

Mr. KORCHINSKI: Do you say this is competitive with other companies?

Mr. EMMERT: Yes, there are many people in the parts business.

Mr. KORCHINSKI: Do you say you are quite aware there are other companies doing the same thing? Would you say this 15 per cent would represent another company's total sales of parts?

Mr. EMMERT: Mr. Korchinski, what I said was that we had established a sales objective of 18 to 20 per cent, based on our knowledge of some other segments of the industry.

Mr. HORNER (*Acadia*): I would read out of that statement, Mr. Emmert, that you implied someone, or somebody else, was getting part of the sales business on your parts. In other words, I gather that some other manufacturing companies are selling parts for your implements, and you are trying to get that business. Am I right in interpreting your remarks in this way?

Mr. EMMERT: You are quite right, Mr. Horner, in your latter statement. We believe there are other competitors selling parts for machines that were marketed under the Massey-Ferguson and Massey-Harris label, and we will not be satisfied until we obtain that business which was generated by the sale of our goods.

Mr. HORNER (*Acadia*): I understand you now. Thanks.

The CHAIRMAN: Well, gentlemen, if there are no more questions we shall pass on to section C, which deals with engineering, research and development.

Mr. KORCHINSKI: May I ask just one more supplementary question? This would lead one to believe that you are not very much interested in having someone else come in on your parts business. I am going to assume then that you are not interested in standardization. What would you say to that?

The CHAIRMAN: That statement needs an answer.

Mr. EMMERT: He has not asked a question yet, Mr. Chairman.

The CHAIRMAN: He is interested in standardization.

Mr. NASSERDEN: I have one more question. I do not know whether you want to answer it or not.

The CHAIRMAN: Is this on section C?

Mr. NASSERDEN: This is on section B. What would happen to a dealer who undersold repair parts at the list price that you suggest to him?

Mr. EMMERT: You mean who sold for less than the suggested maximum retail price? Nothing, from our point of view.

The CHAIRMAN: Any questions on section C?

Mr. PETERS: We are interested in this charge that is continually being made by the farmers that the manufacturers are manufacturing models—I guess you would call it model—because they have a slight change that makes them different and yet they are of no particular value to the farmer. Somewhat the same charge is being made for planned obsolescence in the automobile industry, and it would appear that in many cases, particularly in the last two years, there has been a planned obsolescence in farm machinery through the production of models that serve no particular purpose, at least there was no reason for that change other than encouragement of farmers to buy them because of the adding of chrome or frills. Has this been a problem with your company?—Before you introduce a new model, do you ascertain what method you used to determine whether there is justification for this new model because of the innovations on the new series?

Mr. EMMERT: Mr. Peters, I assume I may answer the latter part of your statement.

Mr. PETERS: Whichever you want. It has to do with the charge that machine companies are manufacturing many models that do not serve any purpose except to encourage the farmer to keep up with the Joneses.

Mr. EMMERT: Mr. Peters, yesterday the matter of planned obsolescence came up in the proceedings and I thought I was as clear as I could possibly be on it, that we do not subscribe to it. The latter part of your statement had to do with the question as to how we determine whether a new model is required or will be popular. We really have two methods of determining that. One is through market research, by inquiring into the requirements as stated by the customers. This goes on all the time, by observing the kind of models that our competitors offer and their popularity or lack of it in the market, also by observing very carefully and diligently the sales popularity of our own models with certain features or without them.

Mr. PETERS: How much research do you give before you make a major innovation? There are not too many in the tractor field—I am not too familiar with a lot of farm machinery— but it does not seem there has been too many, the Ferguson ideal of the 3-point hitch was a good example; but where do you try these out or what method do you use to see if these things are going to be worthwhile? Do you have a farm?

Mr. EMMERT: Through the methods I described. I think you are now getting into the area after the decision has been made to bring in a model, then what do we do about it? Our procedure is first of all to erect a design, secondly to build a prototype or prototypes, thirdly to test them in our own hands. This is done in our farm in Ontario near Milliken. It is done on another farm in Michigan not far from Detroit, another farm in Phoenix, Arizona and another farm in Thomasville, Georgia. We sometimes use the method which is quite common of placing in the hands of selected customers prototype pieces of our equipment. Last summer, for example, we placed in the hands of the largest custom combine operator in the world a prototype of a new combine. He uses it with his men. We have a test crew. We observe the results, we tabulate those and then the next stage would be to decide whether the tools for the product are satis-

factory. After tooling, we usually produce what in the industry is called a pre-production run, that is a small number, maybe 50 or 100, depending on the machine. They are placed in the dealer's hands but we urge the dealers to get them into the hands of the retail customers promptly. We are doing that right at the moment on a new transmission development on one of our tractors. If the article is still satisfactory at that stage, then we can decide or not to go into full production. These are the risks we take as we go along.

Mr. PETERS: Are there any legal limitations on your engineering program?

Mr. EMMERT: There are certainly legal limitations in the form of patent laws.

Mr. PETERS: I meant in meeting certain requirements. How close is the farmer protected in safety devices, for instance in new types of machinery?

Mr. EMMERT: There are safety codes, Mr. Peters. Unfortunately, in neither of our countries in which we operate, Canada or the U.S., is there a national code? There are many state codes and there are some provincial codes all bearing on the matter of safety. We obviously have to comply either in the original design or in the modification for sale in that particular area.

Mr. PETERS: You would then be satisfied that the demand for new machines or for a modification in that machine is satisfied by the sale of the machine?

Mr. EMMERT: Mr. Peters, I would hope that not only were we always satisfied but that our findings were borne out by the fact that I would be less than truthful if I told you we were always 100 per cent right. I can think of some horrible examples from our point of view of misreading the market intelligence on the part of our company and on the part of many other companies, and not only in the agricultural implement field. I do not even have to name names, but just go to the automotive field and you can name as well as I some models that never came off.

Mr. KORCHINSKI: Mr. Chairman, listening to Mr. Emmert stating that they do conduct tests and so on, and after having a prototype in the field and after finding out what its weaknesses are, you then try to determine whether there is a market for it. You have also stated that you can think of some horrible examples; yet on page 12 of your brief you state: "in fact we might say that the most insistent demand for innovation comes from the customer." On page 5 you say: "but, we have told them and have told the shareholders, that since the quality of management, along with research, development and product innovation, are the only areas where we have significant control over our business, we must do a still better job." On page 13 you tell us that you have spent \$11½ million on this work. How do you square these statements? First of all you tell us that it is the farmer. In other words you do inquiries and so on, then you go on to tell us that there have been some horrible examples of mistakes. You also tell us that you take the machine and wonder whether there is a sale. How do you square all these things?

Mr. EMMERT: I do not think I said all those things.

Mr. KORCHINSKI: It is on the record.

Mr. EMMERT: Let us get the transcript and read it, then.

Mr. KORCHINSKI: What did you say, then? You stated here on page 12:

In fact, we might say that the most insistent demand for innovation comes from the customer.

Mr. EMMERT: Shall we talk about that now?

Mr. KORCHINSKI: That is fair enough, but you also tell us that since that is the only area of control you might have, you must do more and more; in other words you are more insistent to try to improve on it. Did you not suggest that there have been some horrible examples in the United States or of something

of that nature? If I remember correctly, you also suggested you had a machine tried, and the man who does the custom component takes the machine and finds out where the weaknesses are in it. I may not be getting your words right, but you also suggested that he would find out the weaknesses and then find out what is the matter with it. You can correct that if you wish.

Mr. EMMERT: Mr. Korchinski, I think I will have to correct it.

Mr. KORCHINSKI: Correct it in any way you like.

Mr. EMMERT: I did not say we would be attempting to find out if there was something wrong, or where there must be something wrong. I said that we run the risk of the size of the market for our particular product. I did state that there have been some horrible examples. To give you a horrible example on the part of Massey-Ferguson, a creation entitled a side-mounted baler. This was a good idea, the customers would like it. We could not make it work nor has anyone else made it work. It is still a good idea if someone were smart enough to make it work. This is what I mean by mistakes being made. I know today there is a demand for that type of equipment, but we cannot produce one that is satisfactory.

Going back to page 12, which was really the basic statement which you referred to, it says:

In fact, we might say that the most insistent demand for innovation comes from the customer.

We know that is a true statement. We know it because if we fail to provide the same kind of features and innovations that our competitors do, the sale of our outdated product declines, customers will not buy it. Therefore, the demand is arising to provide at least that innovation or something in advance of it. That is what I mean by that statement.

Mr. KORCHINSKI: Thank you, sir, for your explanation.

Mr. HORNER (*Acadia*): In relation to my questions on standardization—I gave my views on standardization earlier, but I would repeat this on the question of testing. There have been rumours from time to time in regard to Massey-Ferguson, or Ferguson—coming out with a hydraulically operated car. Is this so, and are there tests going on?

Mr. EMMERT: Mr. Horner, I am afraid I cannot reply to that. Mr. Ferguson, now deceased, has not been associated with our company for many years. I have no idea.

Mr. HORNER (*Acadia*): In other words, you know nothing of it?

Mr. EMMERT: No.

Mr. HORNER (*Acadia*): There is one further question on standardization. You mention cultivator sweeps and hydraulic couplers. You also mention standardization of the power take-off, which is readily accepted as a good example. This all happened a while ago. I wonder if you would deal with the standardization of hydraulic break-way couplers. This is the kind of thing that aggravates the farmers from time to time. You have the break-way couplers in a line from the tractor to the implement, but every company have their own hydraulic couplers. The machine company that makes the tractor generally mounts their own couplers on the tractor. You back up to another machine and you have to change your cylinder around and do quite a lot of friggin' around. I always thought they could have some standardization of hydraulic couplers. It seems quite conceivable to me, and I believe that most farmers would appreciate it.

Mr. EMMERT: I think Mr. Forsyth is probably more able than I to answer that, Mr. Horner, but I would like to make just one very general statement on the matter of standardization. I think we stated yesterday that the farm

equipment institute, the body of manufacturers, through their engineering activity, are doing a great deal of work on standardization of such things as you have mentioned. The difficulty, of course, arises on the question of which design we are to standardize.

Mr. HORNER (*Acadia*): I realize that.

Mr. EMMERT: That is where everything falls down.

Mr. FORSYTH: Mr. Chairman and Mr. Horner, I can realize your apprehension and that of any other owners in regard to the standardization of hydraulic quick couplers or de-couplers. As you, or anyone else connected with this would know, since their invention in 1948 or 1949 they have come into common use and there has been a myriad of models and types principally built by—we refer to them as aircraft manufacturers—who are the main hydraulic producers in the country. A tremendous amount of work has been put into the standardization of hydraulic coupling on hydraulic hoses. I do not have the tractor red book, a year book that gives the tests for standardization, on the back of it. You will note that there are standardized lengths of hose, or different lengths of hoses are stipulated. You get these if you buy from a reputable manufacturer. The society of automotive engineers meet in a group and try to standardize these things. Up to the present time they have been unable to resolve their views as to what a standard hydraulic coupler should consist of, but, thank goodness, they are pretty much down to a couple of fundamental models now, and I would think that that standardization is on the horizon.

Mr. HORNER (*Acadia*): Thank you.

Mr. FORSYTH: It is granted that some ten years ago it was a pretty hazy situation.

Mr. KORCHINSKI: Do you not ask the farmers in these cases?

Mr. FORSYTH: Amongst the groups represented, it would be hard to guess the number of thousands of farmers asked. It would probably comprise the major number of letters which the machine companies receive about hydraulic couplers.

Mr. KORCHINSKI: This is the type of question I asked Mr. Emmert here on which we did not get a comment.

Mr. HORNER (*Acadia*): I have one question on standardization of the testing. You mention power take-off on 1,000 revolutions per minute. This has caused a great deal of concern to farmers operating tractors with standard power take-off in the range of 540 or 530. How big a difference will this make? You go on to say that some sort of a gear shift will be available to speed the present power take-off r.p.m. up to 1,000, but when do you think that will be? I will put my question simply. When do you think this changeover will come in your particular company—I say, approximately, I do not mean any dead date, or anything like that—and is it necessary?

Mr. EMMERT: Mr. Horner, replying to the first part of your question, I think we would be forced to offer 1000 r.p.m. as an option within the next three to five years.

Mr. HORNER (*Acadia*): Yes.

Mr. EMMERT: On the second part of your question, there are widely divergent views about it. The plain fact is that it is already offered by competitors of ours.

Mr. HORNER (*Acadia*): What is the name of the company?

Mr. EMMERT: John Deere, Ford, and I think International Harvester. That is what is going to force us.

Mr. HORNER (*Acadia*): Yes, I realize that.

Mr. KORCHINSKI: Just to change the mood of this whole committee, I wonder if Mr. Emmert could not give us an earth-shaking announcement to-night and tell us about some new tractor, such as a solar-powered tractor?

Mr. PETERS: Mr. Chairman, I think we should get to the business of this committee, rather than to satisfy some of these farmers about power equipment.

The CHAIRMAN: Are there any questions on section D?

Mr. CLERMONT: Mr. President, I may be asking a question which was asked last night when I was not here. The company sets 11 per cent interest. First of all, it is not in your contract. There is no rate of interest in your contract except for those who are in default, whereupon it is 12 per cent.

But in speaking of 11 per cent, let us suppose there is a sale for 12 payments. Is the 11 per cent charged on the balance for 12 months, and after every month you get it in instalments; but is the 11 per cent charged on the first instalment? Eleven per cent is charged on the different balances.

Mr. EMMERT: I am very sorry that you were not able to be present this afternoon when we had a very full discussion about this.

Mr. CLERMONT: Sometimes we are called away.

Mr. EMMERT: I realize that, but it is very fully set forth in the excellent transcript which is provided by the staff.

Mr. CLERMONT: Is the 11 per cent charged on different balances? Let us suppose a farmer owes \$500 as balance on equipment, and he pays it in 15 months. Is 11 per cent charged on the 15 months and when every month the balance is not the same?

Mr. R. M. SNELGROVE (*General Attorney*): The time payment differential or finance charge is calculated on the definite balance. That takes into account the total price, less deposit and less freight. The 11 per cent—or it would be more correct to say 11.08 or thereabouts, is simple interest.

When speaking of simple interest I believe it is correct to say that it is payable on a declining balance basis, and only on the balance owing. The 11.08 per cent is payable on the balance owing. It is included in both the credit and the property balance.

Mr. CLERMONT: Let us suppose that a farmer owes \$500, and he pays it in 15 months. You say you charge 11 per cent on \$500 for 15 months.

Mr. SNELGROVE: Yes. The rate is a simple interest rate on the declining balance owing over that period of time.

Mr. BADANAI: Insurance is included in the total cost of the machinery, is it not?

Mr. SNELGROVE: You have several coverages in this insurance. You have credit life insurance which insures the person who executes the contract up to the extent of \$20,000. Then you also have property insurance.

Mr. BADANAI: Is that included in the 11 per cent?

Mr. SNELGROVE: Yes.

Mr. NASSERDEN: I think what Mr. Clermont wants to know is this: if he could pay more than 11 per cent or less than 11 per cent depending on when the payments are made.

Mr. CLERMONT: That is not what I had in mind, because I know about other finances. Suppose the balance is \$500. Would it be 11 per cent for a year? That would be \$55; and if he makes his payment within the year, then what?

Mr. SNELGROVE: That would depend on when your payments are made. We lump, whether by a lump sum or not.

Mr. CLERMONT: Suppose there is a balance owing of \$500 to be paid within a year, in 12 exact amounts.

Mr. SNELGROVE: If you had \$100 balance for a year, on monthly payments you would pay \$11.08.

Mr. CLERMONT: That is not 11 per cent, because after six months I will owe only \$50, yet I will have to pay interest for a year on \$100.

Mr. MONTGOMERY: You do not have to take it if you do not want it.

Mr. CLERMONT: I know that. But what I am interested in is what the money costs. The financing is too expensive. It is not 11 per cent anyhow.

Mr. EMMERT: What is that?

Mr. CLERMONT: If I owe \$100 and it is paid in exact amounts within a year, at \$10 a month, and I pay 11 per cent interest after six months, then I have paid \$50; but I have to pay interest on \$100 for a full year.

Mr. EMMERT: I suggest that there is a misunderstanding here. What we intended to say was that the effective rate of interest calculated as on a time payment plan is 11.08 per cent. What you are attempting to find out, I think, is whether we charge 11 per cent on the deferred balance, and 11 per cent on the deferred balance each month thereafter.

Mr. CLERMONT: No, no.

Mr. EMMERT: That is the way I understood you.

Mr. CLERMONT: I said that if I owed \$100, he said my interest would be 11 per cent for a year on \$100. But after I make six payments, I then do not owe \$100. I owe only \$50; but I have to pay interest for a full year on \$100. That is what I meant.

Mr. SNELGROVE: The dealer, when he draws up the retail contract and the conditional sale agreement uses charts, a copy of which I can pass around the room here. These charts are prepared by actuaries and persons of ability in this field.

They calculate the interest, and there are various patterns depending on the down payment, the deferred balance, and the period of time over which it will take. It works out simply to 11.08, and it varies in the amount of 0.1 per cent.

Mr. CLERMONT: Are you charging your interest on the same basis as other finance companies?

Mr. SNELGROVE: I do not know.

Mr. EMMERT: Perhaps I might ask Mr. Forsyth, who has written many of these contracts and has experience to deal with it.

Mr. FORSYTH: I think Mr. Clermont's question is the one I was trying to answer this afternoon in response to someone who spoke about six per cent interest, and I asked if it was not one-half per cent per month that they were talking about.

May I go from 11 per cent to 10 per cent in order to simplify the arithmetic, and take \$100. I think your question is that you owe us \$100 but you pay it—let us take 10 months at \$10 per month. Do we charge you that \$10—let us take \$120. Do we charge you \$12 interest, which is simply 10 per cent interest or do we deduct the amount you have paid each month and calculate the interest thereon? This is what Mr. Snelgrove has attempted to explain. The latter is true. Let me oversimplify. You pay it twice; \$60 at the end of the first six months and \$60 at the end of twelve months. Then you will owe \$11.08 per cent interest per annum or \$100 for six months. Rather, it would be \$120 for six months, and you would owe \$11.08 interest on the \$60 for twelve months. Does that answer the question?

Mr. CLERMONT: I asked if your contract was based like any other finance company. He said he did not know if it is like any other finance company, because it is more than eleven per cent.

Mr. FORSYTH: That does not work out to more than eleven per cent.

Mr. ROMPRE: Could you submit a chart. All companies have a charge chart. It shows if you are paying for six months how much you pay, and so on. I believe you would have this.

Mr. EMMERT: We have and will submit it to the committee.

Mr. MILLIGAN: In Saskatchewan there are the A.M.A. testing depots and all equipment sold within the province is required to be tested at this testing depot. Would you cooperate if some of those stations were in the east as well?

Mr. HORNER (*Acadia*): This is mentioned on page 15 of section D in the brief.

Mr. EMMERT: I believe we have cooperated with the province of Saskatchewan. That is not to say we have always been in agreement with either their procedures, techniques and not necessarily their findings. We would cooperate with any such station established in the eastern part of Canada. I can only say we certainly would do so to the best of our ability, because that is our very spirit of doing business in the country.

Mr. MILLIGAN: It assists you in remedying some of the weakness in some machines in western Canada.

Mr. EMMERT: I would not say it has.

Mr. HORNER (*Acadia*): On page 15 you say "our engineers act as liaison with the A.M.A. and this becomes an expensive undertaking. Right-offs on equipment used in testing represent another cost to the company". There has been a great deal said about testing. We had a brief submitted earlier which suggested that the federal government set up testing stations throughout Canada. This is why I am asking this question. Just what approximate amount does this cost the company? Is it half of one per cent of the sales, or is it \$200,000. Could you give us a rough estimate?

Mr. EMMERT: The cost as related to the sales dollar of course would depend on how many machines were tested. I think the best approximation is that after a machine has been through the tests we would be very fortunate to realize more than half of its new dealer value.

Mr. HORNER (*Acadia*): Thank you. I believe the same costs would be incurred in respect of the Nebraska test, for instance.

Mr. EMMERT: Yes.

Mr. KORCHINSKI: Is that not included in your eleven and a half research expenditure?

Mr. EMMERT: Not to date, because only within the last four months did we formulate the arrangement so that our engineering and research department worked with the government. Prior to that it was incumbent on the branch at Saskatchewan to furnish the equipment.

Mr. PASCOE: On page 15 it says the dealer must be licensed. Does any cost incur to him as a result of this, or is it taken up by the company?

Mr. EMMERT: None of that test cost in respect of the equipment goes to the dealer.

Mr. NASSERDEN: Mr. Chairman, as I believe Mr. Emmert indicated, the parts required in the event of an emergency—he did not mention seeding, but for instance in seeding, haying or combining—they were sent to the dealer sometimes by air express at his expense. I have heard of the dealer passing this on to the farmers. Do you not think it would be better public relations for the company to absorb that as part of the cost of the order to begin with.

Mr. EMMERT: I bow to our general sales manager in respect of this.

Mr. FORSYTH: I guess I have to agree with you that it would be pretty good public relations, but I believe we are considering the possibility of a reduction in the price of farm machinery. I believe that would be an awfully substantial cost for a company to bear and it would probably reflect in an unfavourable manner.

Mr. NASSERDEN: The farmer is bearing the burden unfairly because he is in the unfortunate position of being without the part and the dealer or the company is unable to supply the part.

Mr. FORSYTH: Do you mean our dealers undersupply their parts?

Mr. NASSERDEN: You could put it that way if you want; but sometimes he is not to blame either.

Mr. FORSYTH: That is possible. Actually there are different circumstances. I think the best way to explain it is that no one would expect a dealer to have one hundred per cent of these parts in stock. Let us assume the dealer does not have, and orders the part from our branch. If he does and we are out of stock, in that instance we do bear the charge under varied circumstances. There are other cases in which that is not the situation.

Mr. NASSERDEN: I am not thinking only of Massey-Ferguson.

Mr. FORSYTH: This would be a very expensive item to put before the public as a public relations or advertising medium. I would like to explain it in a different way. If a grain grower was able to go to our branch office and pick up a part, and if that situation continued, there would be no incentive on the dealer to supply any parts. He would put the onus on us to get the parts to you when you wanted them.

Mr. EMMERT: I think I can settle this point. We pay the express charges for transportation when, in our view, the cause of it was within our control as, for instance, in a case where we did not have an adequate supply of items. If our suppliers or factories fell down, and the fault was not at the branch, we pay. However, if it does not, in our opinion, come within our control, then either the dealer or the customer pays.

Mr. NASSERDEN: The reason I brought this question up was this—and it is not in reference to Massey-Ferguson Company; this is another company. A farmer broke a certain part in connection with his tractor. It had to be ordered, as it was not one of the pieces which ordinarily break. It had to be brought up express, and the farmer knew he had to pay for it. I think that perhaps you should take those things into consideration when setting your prices for parts, because you get a farmer very angry when a thing like that happens.

Mr. EMMERT: Well, we have no desire to enrage our farmer customers, Mr. Nasserden, and I think you would agree that the policy that I have enunciated is certainly fair. If it is our fault, we pay; if it is someone else's, they pay.

Mr. KORCHINSKI: In that case, would a farmer know whether you paid or not?

Mr. EMMERT: Well, I think most customers have a reasonable rapport with—

Mr. KORCHINSKI: It depends on his relationship.

Mr. EMMERT: Yes.

Mr. HORNER (*Acadia*): I have one question in connection with the bottom of page 18 and the top of page 19. You say here that the dealer, today, is definitely faced with a buyer's market; in other words, that the farmer is in the driver's seat in regard to buying prices. I am not going to debate this

point, because it is a very debatable point, and it would take too long. However, at the top of page 19 you say that many promotional ideas are used by dealers, such as giveaways, special discounts, free gasoline, along with extensive radio, and newspaper advertising. The question I want to bring up is in connection with special discounts and free gasoline. I have seen advertisements in weekly magazines setting forth \$100 free gasoline which such-and-such a company provides. The dealers are not mentioned. Surely, it is not a dealer who is providing this. In a sense, it must be provided by the head office, because the company is paying.

I have another example of this: I have seen advertisements in weekly newspapers, setting forth a \$150 special discount on tractors; if purchased before a certain date. Surely the dealer is not providing this; the company must be.

Mr. EMMERT: Well, if I may read from the brief, we ascribe promotional ideas such as giveaways. Here is one which I have, a little knick-knack that goes on a key chain. There are lighters, special discounts. Some dealers will provide, as an incentive to their customers, a discount on service during the slow period. Very often, they will provide a discount on a particular machine of which they believe they have an overstock. Dealers certainly have been known to provide free gasoline as an inducement to the customer to buy. Dealers are encouraged by all manufacturers to participate in newspaper and radio advertising. There was a time when dealers were encouraged to contribute to the national TV advertising, but that is not done today.

Mr. HORNER (*Acadia*): I do not mean to interrupt, Mr. Emmert, but I want to get clear who is giving these special discounts, because there has been a great deal of discussion about the fact that there is price competition at the dealer level, but not at the machine company level. I suggest to you that this is the case. As you pointed out, you give dealers special write-offs. In a sense, are not the machine companies then providing these special discounts and free gasoline?

Mr. EMMERT: No, I would not agree with that, because the very next sentence in the brief says: "We give". We might have used the word "also". "We also give our dealers special off-season discounts as a means of overcoming the high seasonality of sales in our business." We also have been known to have programs. Perhaps some of you remember a program we ran, which was called The Clare Burt cash bonus offer. Also, we have been known to offer, in season, cash discounts to a retail customer. This is direct from the company.

Mr. HORNER (*Acadia*): In a sense, then, the dealers give special discounts, free gasoline and other giveaways, but so does the company enter into special discounts and special offers.

Mr. EMMERT: Sometimes.

Mr. HORNER (*Acadia*): Fine.

The CHAIRMAN: Gentlemen, we shall proceed to section E, labour relations.

Mr. PETERS: What is the base rate in your contract?

The CHAIRMAN: Will you answer that question, Mr. Emmert?

Mr. EMMERT: What is our base rate?

Mr. PETERS: Yes.

Mr. EMMERT: May I have a definition of the base rate, please?

Mr. PETERS: Well, you negotiate a base rate in a contract. The base rate is the low hourly rate you pay, not taking into consideration incentives.

Mr. EMMERT: What you are really asking is the lowest rate we pay.

Mr. PETERS: Well, for instance, what is the sweepers rate.

Mr. EMMERT: Are you asking if we have a sweepers rate, and if he is the lowest paid man?

Mr. PETERS: This is not a difficult question. All contracts have a base rate.

Mr. EMMERT: Mr. Denton, will you get that information?

Mr. PETERS: I was just curious.

Mr. DENTON: The base rate, actually, for incentive workers varies, but the base labour rate, excluding the cost of living, would be \$1.65 per hour.

Mr. EMMERT: And, including the cost of living.

Mr. DENTON: I believe it is now at \$1.68. It would be three or four cents more.

Mr. KORCHINSKI: Would you be prepared to supply us with the amount of percentage increases in wages? Perhaps I should put it another way: Would you supply us with the increase in salary since 1946? Could you supply us with information showing, on a yearly basis, what increase was effective?

Mr. EMMERT: Year by year?

Mr. KORCHINSKI: Yes.

Mr. EMMERT: I think we will find a table here, and this may serve your purpose, Mr. Korchinski. I am referring to exhibit F, on page 16 of E.

Mr. KORCHINSKI: I would like to have that expressed as a percentage.

Mr. EMMERT: We could very easily calculate it for you.

Mr. KORCHINSKI: Well, perhaps we should have it, just for the record. Could you express it as a percentage?

Mr. EMMERT: For example?

Mr. KORCHINSKI: From 1947.

Mr. EMMERT: In 1947 it was \$1. The next year it was \$1.19. That is a 19 per cent increase. Then it went to \$1.25. We could calculate that. The index over here is another way of measuring it.

Mr. KORCHINSKI: Well, that is fair enough. I suppose I can figure that out, if I want to. My next question is this: I suggest it has nothing to do with labour relations but it has a bearing on what I had in mind—

Mr. EMMERT: If I may interrupt, you will recall from the chart—the index period from 1947 to 1960,—during that period the percentage increase was 117 per cent, the same figure as shown on the chart we had here several days ago.

Mr. KORCHINSKI: What I should like to know is could you, starting in 1947, express as a percentage the increase in the cost of your machinery for the comparable years?

Mr. EMMERT: Once again, we can express this in terms of percentage. On the chart which I hold in my hand you will recall this dotted line indicated the farm machinery price index. This is a distribution figure.

Mr. KORCHINSKI: That again is an index.

Mr. EMMERT: Well, expressed in percentages it would be 100 per cent.

Mr. KORCHINSKI: I want this clarified so that I can understand it. In 1947, although it was actually a dollar, your index is 80 cents.

Mr. HORNER (*Jasper-Edson*): It is 100.

Mr. EMMERT: Going back over the period from 1949 to 1960 the percentage increase would be 117 per cent in respect to labour. In the same period of time the percentage on the farm machinery price index would be slightly in excess of 100 per cent. The exact figure is 101 per cent.

Mr. KORCHINSKI: Could we have that for every year from 1947?

Mr. EMMERT: Yes indeed we can.

Mr. KORCHINSKI: I should like to have it, to compare it side by side with the other. In establishing the wage scale for the coming year, do you find that the unions or negotiating teams consider your profits in cases where there are profits and, if there are losses, do they consider them also?

Mr. EMMERT: Well, Mr. Korchinski, that is certainly the subject of conversation in negotiations. I speak not only as an interested observer on the part of the company but with some first-hand knowledge, having done a bit of it myself. If a company's profits are high in the minds of the union negotiators, they become a big topic of conversation. If the profits are normal they do not receive as much emphasis on the part of the union negotiators, and if the company is at a loss, that receives no attention whatsoever.

Mr. KORCHINSKI: But nevertheless negotiations still go on. Why was it \$1.80 in 1944 and in 1955 it was \$1.79?

Mr. EMMERT: This is average hourly earnings and I assume that some variation could be caused because of the method of payment, incentive schemes, overtime and such things.

Mr. DENTON: All overtime is included when we state average hourly earnings. The amount we pay for overtime is added to the average.

Mr. EMMERT: I also mentioned earlier that we normally have a very high content of skilled labour in our plants because we do all our own tooling. If the tooling load was down in that year, that fact would tend to depreciate the average hourly earnings.

Mr. NASSERDEN: What is your premium for overtime?

Mr. EMMERT: The premium for overtime is 50 per cent for time in excess of eight hours per day, or forty hours a week.

Mr. DENTON: And Sundays and statutory holidays would be double time.

Mr. KORCHINSKI: I have been trying to look up your net earnings for the year 1955. If I remember correctly, it seems to me that was one of the bad years for Massey-Ferguson.

Mr. EMMERT: Mr. Denton, have you any comments to make?

Mr. DENTON: On page 5 of our submission you can see the increase in cents per hour in 1954 was 3 cents.

Mr. NASSERDEN: And in 1955 it was what? Page 5 of what?

Mr. DENTON: Page 5 of section E. Mr. Emmert, I should like to correct the statement I made previously on the base labour rate. I failed to add the two factors which we have subsequently added for the increases during the term of the agreement. The figure should be \$1.81 plus three cents for cost of living, making it \$1.84.

Mr. EMMERT: That replaces the 65 and 68 which was mentioned.

Mr. NASSERDEN: Could you give us the high and the low?

Mr. EMMERT: We have just given you the low.

Mr. DENTON: The high varies because of our incentive plan. The high would really be of no significance for this.

Mr. NASSERDEN: I happen to be very interested in this incentive plan because I think it is a very good thing. I was wondering how much extra a man can earn by devoting himself to the job.

Mr. EMMERT: As I recall, it runs as high as 140 per cent of the base.

Mr. DENTON: The base rate varies, starting with \$1.81 and going up by 5 or 6 cent increments, with the normal incentives above that. We would expect the average person to be able to make about 125 per cent, so the incentive earnings would vary up to 130 and, in some cases, up to 140 for an extraordinary person.

Mr. NASSERDEN: What percentage of your labour force would qualify for incentive payments?

Mr. DENTON: This would just be an approximate figure, but I would say about 35 per cent.

Mr. NASSERDEN: Do you look for any improvement on that by providing training in some form for your employees?

Mr. DENTON: The figures I gave you are based on the incentive system. As I stated previously, our employees are paid under three different systems, day work, mixed day work and the incentive system. The figure I gave of 35 per cent is for employees paid under the incentive system, depending on the type of work.

Mr. HORNER (*Acadia*): I have a supplementary question on wages—

Mr. NASSERDEN: When I have finished.

Mr. PETERS: One at a time.

The CHAIRMAN: I am calling Mr. Horner.

Mr. HORNER (*Acadia*): I notice that on page 6 of the brief you state that 28 per cent of the annual payroll goes on fringe benefits. Now, just to clear this up in my mind, we are talking about wages at something like \$2.19, and is it true that this figure of 28 per cent is over and above that amount?

Mr. EMMERT: You would have to add 28 per cent to get the cost.

Mr. HORNER (*Acadia*): In other words, the base rate is \$1.84. Would the people who get that be entitled to fringe benefits which would enable them to increase that again?

Mr. EMMERT: Actually, the percentage in the lower level described as fringe, would be right.

Mr. KORCHINSKI: Since you have stated that the profit the company shows is one of the factors the unions and negotiating teams consider in establishing what they feel should be their wage rate for the following year, and since you also state you would be interested in showing a greater return for the company and a greater profit, if your company decided to pay deficiency payments would that mean a greater return to the farmers?

You would then have been in a position to charge more because you might have considered that you should get more. You have already stated you should get a fair return. Would that not have placed the worker or the union or the negotiating teams you may have to deal with in a position where they would say that they would like to get more?

Mr. EMMERT: Mr. Korchinski, I do not think we need to spend any time attempting to think up inducements for our negotiators to ask for more.

Mr. KORCHINSKI: If you were to show greater profit, would that not have been a factor for them to ask for more? In other words, your costs would go up and where would we be as farmers?

Mr. EMMERT: If we go back to what was actually said on this thing, you asked whether it was a factor, the matter of profits or losses. I believe my reply was in the context that if our profits were high, it elicited a great deal of conversation about that from union negotiators. I do not think I agreed it was necessarily a factor. The union people of course make a great point of it. Our profits as a company would cause them to discuss it to a great extent and through that try to put more pressure on Mr. Denton who does the negotiating.

Mr. PETERS: You first gave a base rate of \$1.65. How did you arrive at the 16 or 17 cents, whichever it happened to be, as an increase to the wages without contract negotiations?

Mr. DENTON: The last agreement we signed was a three-year agreement which involved two automatic increases, and for this particular category of labour these increases varied. It involved increases during the term of the agreement.

Mr. NASSERDEN: On page 6 of this section E it is stated: "the fringe benefits at M-F are generous in comparison with arrangements prevailing in outside industry. The cost of fringe benefits in January 1961 at M-F amounted to almost 28 per cent of the annual payroll or an average of \$1,275 per employee." Does that fluctuate with different employees, the amount of fringe benefit that is available to them?

Mr. DENTON: Yes, that would certainly fluctuate. For example, certain employees, depending on years of service, would be entitled to different amounts of vacation. Obviously that cost per individual would vary.

Mr. NASSERDEN: The only other question I would like to ask Mr. Emmert on this is whether he knows that almost 60 per cent of the farmers in Canada receive less than \$1,200 per year? It is 40 per cent. I would even be glad to accept the figure of 30 per cent.

Mr. HORNER (*Jasper-Edson*): You will be pleased that the government is going to continue the \$20 million subsidy because you have taken major advantages of this both in your sales to the Canadian customer and also to the American ones. Is that correct?

Mr. EMMERT: I deplore the necessity for any subsidy, but we are naturally pleased if that means that the rates would remain static or even go down.

Mr. HORNER (*Jasper-Edson*): I am just suggesting to you that this is a similar subsidy which has been paid for the last two years, and you people have had the advantage of it as it reduced freight rates from 17 per cent to 10 per cent and then down to 8 per cent.

Mr. EMMERT: Dr. Horner, by far the greatest effect of a freight rate increase on the part of the Canadian railways would be to the detriment of the retail customer.

Mr. HORNER (*Jasper-Edson*): But I am suggesting that this has helped your competitive position in the United States and in western Canada.

Mr. EMMERT: I would choose the words a little differently. I do not think it has helped our position; it has assisted in not worsening it.

Mr. HORNER (*Jasper-Edson*): I want to ask a question with regard to equalization of freight rates. You note in your brief with regard to the 1955 act when partial equalization came in. We also know that certain other industries have carried that along on their own and have equalized freight rates to the various customers across the country. Has your company done anything in this regard?

Mr. EMMERT: Mr. Child, would you care to speak on this?

Mr. CHILD: Our prices are based on the f.o.b. factor, so that a customer in Winnipeg is going to pay less than a customer in Edmonton for the same machine. That is the laid down cost.

Mr. HORNER (*Jasper-Edson*): As a company, you have not done any studies in changing your policy in this regard? In other words, have you done any studies or have you considered the possibility of improving your competitive position by a process of equalization of your freight rates, taking into consideration, I realize, that the percentage of market over which you have had advantage now in your Canadian operation and as compared to percentages?

Mr. EMMERT: Dr. Horner, your question was: has the company made any studies on this matter? The answer is, yes.

Mr. HORNER (*Jasper-Edson*): That is as far as it goes.

Another area which I would like to have some questions answered on. You answered briefly a question earlier on with regard to water transportation, but in your brief you suggest that you have not been able to secure any agreed charges on farm machinery because your machinery is of a nature that there is no competition with the railways in moving.

I want to know a couple of things about this. The rates in the United States from the Moline area, according to your tables, have decreased recently. Is this because the farm machine industry has been able to negotiate agreed charges in the United States?

Mr. CHILD: You are thinking of the incentive machinery rates that you say run from Moline up to the border?

Mr. HORNER (*Jasper-Edson*): Yes.

Mr. CHILD: The farm machine companies have had negotiations with the railways in the United States. As a matter of fact that was done in an endeavour to combat motor traffic competition. They approached us as to some means whereby they might regain traffic and we sat down with them and told them that possibly incentive minimum rates would do it. They found lower rates and a higher minimum might have this effect, and so they agreed to publish a line of rates in that manner. Since that time these rates have been operating in what we like to term the western-south line territory. We appeared before an examination board of the I.C.C. not too long ago, and the evidence was all taken down as to why the rates were reduced, and whether the railways were receiving compensatory amounts for their haul. No decision has been made as yet as to the outcome of that proceeding, although I believe it will go to the commission in Washington.

Mr. HORNER (*Jasper-Edson*): In the United States you have an agreed charge as a minimum.

Mr. CHILD: I believe your conception of an agreed charge is different from mine. This is not an agreed charge; this is a tariff charge which is published for all shipments.

Mr. HORNER (*Acadia*): As regards further development, you state that you cannot get better rates in Canada. You refer to combines and balers being large and complicated machinery which it is difficult to ship on anything but rail. Let us study the question of tractors, where they form 45 per cent of your sales, and talk about them. I know that into western Canada at the moment other companies are using trailer trucks with six and seven tractors on each, and they are bringing them in there from the Moline area. Have you ever transported any of your tractors from Detroit, via the truck method?

Mr. CHILD: Yes.

Mr. HORNER (*Jasper-Edson*): This is it in essence. You can go to the railways and say: "We have a competitive rate from the trucking industry and we should be able to get a better rate on the railways".

Mr. CHILD: As far as trucks and rails from the United States are concerned, the shoe has usually been on the other foot. In other words, the trucks sometimes figured that their services were a percentage higher than the rail. As far as tractors are concerned, it was some time before the truck operators came down on that—and that has happened only within the past year and a half.

Mr. HORNER (*Jasper-Edson*): But they are equal now?

Mr. CHILD: In some areas they are equal. In some areas the trucks are higher.

Mr. HORNER (*Jasper-Edson*): There is one further question. You stated you had quit using water transportation pretty completely. Do you not use water transportation from Detroit for tractors?

Mr. CHILD: We do, to some destinations.

Mr. HORNER (*Jasper-Edson*): I am from western Canada. This is what we are getting at at the moment. We feel very strongly about freight rates in western Canada.

Mr. CHILD: So far there is no operator with authority to haul back from Detroit further than Fort William or Port Arthur. The water transportation I was referring to was from Detroit to Duluth, moving into the Dakotas.

Mr. HORNER (*Jasper-Edson*): There is one further question. What about your tractors which you are importing from the U.K.? You said that you are bringing them by water direct from Toronto. Have you thought of bringing them by water direct to Churchill to supply the western Canadian market?

Mr. CHILD: We did that one year. I forget the year. We brought some to Churchill. But the summer season does not coincide too well with the shipping season into Churchill. This year we had two vessels, one in July, and one in August from Liverpool. By that time Mr. Forsyth hoped to have all the tractors in 1961 placed in western Canada.

Mr. HORNER (*Jasper-Edson*): It would be nice for us in western Canada. We appreciate the port of Churchill. One of their difficulties has always been that of having a two-way traffic, with ships going in to load with grain. I appreciate the difficulty there. But what about the use of piggyback trucks to move some of your farm machinery?

Mr. CHILD: There are three type of piggyback operations. We do use piggybacks. We call it trailer handling, according to the National and C.P.R. for freight from Brantford to Montreal, for some of our smaller machines and parts. We have used it for steel from Montreal back into Toronto. Number one; the piggyback operation is sponsored by the railways with their vehicles. Number two, is where the trucking company put their trucks on the rails. This has happened with our shipments from our industrial plants at Wichita, Kansas, where they are put on to trailers for Windsor.

Mr. HORNER (*Jasper-Edson*): You have not used any of these piggybacks to the west?

Mr. CHILD: No, we have not used any piggybacks to the west. Our experience has been that the rails will only meet truck rates. They are not bound to go beyond truck rates in order to induce the use of piggybacks.

Mr. HORNER (*Jasper-Edson*): I have one further question: what about the better rates for the agricultural industry in the United States to ship from their implements centre in the Moline area? Do you feel that the railways are being properly compensated by those rates?

Mr. CHILD: I was behind them, so I would like to feel that they are compensated.

Mr. HORNER (*Jasper-Edson*): You believe they are. Thank you.

Mr. HORNER (*Acadia*): Mr. Child, you stated that presently tractors are moving from Detroit to Duluth, but there is no authority for them to move from Detroit to Fort William. Did I hear you right? Just what do you mean by that?

Mr. CHILD: There is no available freighter service of the type to accommodate this.

Mr. HORNER (*Acadia*): What type of freighter service is now accommodating you in your shipments from Detroit to Duluth, by water?

Mr. CHILD: It is a United States navigation company which has authority to operate, but no United States company has authority to operate in inter-state commerce between Detroit and Port Arthur of which I am aware.

Mr. HORNER (*Acadia*): Do you think it would be feasible for a company, Canadian or American, to cut the freight rates on tractors going into western Canada by freight—hauling those tractors from Detroit to Fort William? You must be making a saving from Detroit to Duluth, or you would not be doing it. Is there not a possibility of a similar service for western farmers?

Mr. CHILD: You mean water transportation to Duluth and transport beyond that.

Mr. HORNER (*Acadia*): If you had a boat load or practically a boat load, could you do the same thing for western Canada?

Mr. CHILD: If we could find an operator to do that, we would be quite happy. With Canada Steamships we are investigating the question of trucking them across to Windsor and loading them on a vessel there for Montreal. If we could find an operator to do the same thing for Fort William, west, we would be very glad to investigate that.

Mr. EMMERT: There is one very great difficulty in transport of tractors to Port Arthur, that is the seasonal situation. Mr. Forsyth wants his tractors in the west before the navigation season comes about.

Mr. HORNER (*Jasper-Edson*): This would give you a lever for going to the board of transport commissioners.

Mr. EMMERT: We certainly subscribe to what Mr. Child said, that we would encourage a carrier to do this and would hope we could find one.

Mr. HORNER (*Acadia*): On page thirteen you suggest leasing equipment. I think you have in mind trucks. Could you carry this further in respect of leasing barges to transport these?

Mr. EMMERT: No.

The CHAIRMAN: Gentlemen, I wonder if I could suggest at this time as it is nearly 10 o'clock, that we have been sitting a long time. I do not want to curtail any questions or answers, but I wonder if we could make our questions as brief as possible and perhaps the gentlemen replying would make their answers as brief as possible in an effort to finish our proceedings here tonight at 10 o'clock instead of having to come back and sit tomorrow.

Mr. KORCHINSKI: Optimist.

The CHAIRMAN: I think that would be better than having to come back and sit tomorrow. I might point out that our staff is working long hours; also, it is not my desire to work our committee members or witnesses too hard. I think that we should endeavour to finish up by 10 o'clock, if possible.

Mr. HORNER (*Acadia*): I have one further question in connection with page 18 of the brief.

Mr. EMMERT: This is on the transportation section?

Mr. HORNER (*Acadia*): Yes. They suggest that the freight cost has been by way of percentage from 1956 on. However, we do not have any idea of the amount of equipment moved. It is all in dollars. Do you see what I mean?

Mr. EMMERT: I cannot help but smile, because, for two or three days, you and I have been at some odds—I hope not seriously—and here we display exactly, in respect of this element, what I thought you were asking for.

Mr. HORNER (*Acadia*): True, but you see, it does not matter how many dollars. If your percentage remains the same, and if your total sales increase to \$500 million in Canada, as long as your percentage remains the same, there would be no difference, or no possible reduction in the cost of that, or no increase.

Mr. EMMERT: You know, Mr. Horner, we did not put that table in there to serve the purpose that you have been hoping we could provide information

for. We put it in, rather, to illustrate—and we have had very few opportunities to illustrate this—that once in a while we are able to do a good job. What this says is that we have been able to contain the percentage of freight costs to our sales dollar—and let us go from 1956—notwithstanding this kind of increase in the absolute freight rates. All of the things we have talked about in that section have caused us to utilize no more dollars out of our sales dollar for freight than we did four years ago. If we had simply absorbed the freight increase and had not found ways and means of overcoming it, this percentage would be quite different.

Mr. HORNER (*Acadia*): I note that the graph in connection with freight rates takes a sharp drop from the third month in 1958. Is this because of the \$20 million subsidy?

Mr. EMMERT: Would you answer that, Mr. Child?

Mr. CHILD: That was where the 17 per cent increase in 1958 was reduced to 10 per cent, and then reduced by 2 per cent to 8 per cent.

Mr. NASSERDEN: The bulk of those freight charges were added to the cost of the machine when they were sold to the farmer.

Mr. EMMERT: Some portion of them, yes. Certain incoming freight charges were absorbed in the company costs, as well as certain outbound freight charges.

Mr. NASSERDEN: And, this is added on. I have seen it on other contracts, as well. I just wanted to bring that information out because it has been the farmer who has suffered, as a result of the lessening of the freight rate during the last two years. It has been the farmer, or the customer of the company.

Mr. EMMERT: To the degree that it applies to hauled goods shipped outbound.

Mr. NASSERDEN: My other question has to do with plant location and the remarks on page 17. Have you ever thought of setting up an assembly plant for combines in Winnipeg or some other place in western Canada?

Mr. EMMERT: Yes. This matter has been given attention, I am sure by more companies than ours. I believe it was studied by the automotive people from time to time and they looked into the economics of setting up a western Canadian assembly plant. We have investigated the same thing and, in years gone by, it was common practice to assemble certain products in the branches; but this is no longer economic.

Mr. NASSERDEN: But would it affect the overall freight charges?

Mr. EMMERT: It would reduce the freight charges if we could take advantage of the load rules per freight car. We could bundle things but still it would increase the overall costs and would not be economic.

Mr. KORCHINSKI: Could you tell us what general area you had in mind in considering the re-location of plants? Is there some area in western Canada, or had you the United States in mind?

Mr. EMMERT: You asked for a general area and I have to tell you the North American continent.

Mr. KORCHINSKI: I said Canada or the United States.

Mr. EMMERT: We have not looked at any particular Canadian location other than in Ontario.

Mr. KORCHINSKI: With no consideration to western Canada?

Mr. EMMERT: Not in this study.

The CHAIRMAN: Are there any further questions?

Mr. GUNDLOCK: This may be a hypothetical question but, before we leave this particular investigation, I should like to ask Mr. Emmert, in view of the

fact that some questions were answered with reluctance, or not answered at all, in the opinion of some members of the committee, if these same questions were answered by other machine companies to our satisfaction what would be his reaction?

Mr. EMMERT: Mr. Gundlock, I agree that is a hypothetical question and probably my reaction would have to be tempered by the exact replies you may elicit from the other companies. That would certainly have a bearing on any consideration we might give the matter.

Mr. KORCHINSKI: For clarification, I want a short answer to this. Do you separate your parts sales from your larger tractor and combine sales? Are they a separate entity, or a separate accounting department?

Mr. EMMERT: You mean organizationally?

Mr. KORCHINSKI: Yes.

Mr. EMMERT: The parts operation within the company is really operated by two major organizational segments, one called planning and procurement. Their job is to ascertain the requirement for parts, to look after the pricing of parts, to warehouse them centrally and to distribute the parts from the central warehouse to the field. At this point Mr. Forsyth's sales organization takes over, and it is their responsibility to warehouse the parts in the field, ship them to the dealers and look after their sale.

Mr. KORCHINSKI: But as a costs matter the division is not shown on a profit and loss basis as a separate department?

Mr. EMMERT: The cost of parts is billed into the factory costs.

Mr. KORCHINSKI: In other words, it is not one unit?

Mr. EMMERT: I know some companies do what you are suggesting. They have a profit and loss account in respect of parts.

Mr. NASSERDEN: I am looking forward to seeing Mr. Emmert and his associates back here, about a month from now, with the other information we would like to have. I think we have secured some information from them, but the important information still remains to be secured.

Mr. HENDERSON: They will have nightmares when they think of this.

The CHAIRMAN: I think we are probably ready to adjourn but, before we do so, I want to thank Mr. Emmert, Mr. Hickey, Mr. Forsyth, Mr. Penny, Mr. Denton, Mr. Kingsmill, Mr. Childs and Mr. Snelgrove for appearing before us as witnesses. Possibly the committee has not gained all the information members hoped to gain, but I do not think it would be possible to get all that information from one company. The committee will have opportunities of getting it from other machine companies but I hope our friends in Massey-Ferguson will take the opportunity of coming back to us, and that they will have many of the answers we sought, when they do return. Now, I understand Mr. Emmert wishes to make a few remarks.

Mr. EMMERT: I asked your chairman if, at the close of the meeting, I might have a short time to say several things.

I would like, Mr. Chairman, through your good offices, to indicate to those responsible our delight in what we read from the headlines in the *Citizen* this evening—\$362 million worth of wheat which has apparently been disposed of. That goes, of course, with our philosophy that what is good for the farmer inevitably is good for us.

Secondly, I should like to apologize to the committee for an inadvertency on my part. It has been called to my attention by one of our group here—not by committee members—that I used the words "if and when we receive copies of the resolutions which were passed by the committee". I want to make

it quite clear that I use the word "if" in the context of wondering whether or not the resolutions as they appeared at that point would again be changed, as they had been changed previously.

Thirdly, I am going to take one more shot at trying to impart to the committee in the most sincere way that I possibly can Massey-Ferguson's point of view on some of the information that we have been asked for and that we have been unable or reluctant for a variety of reasons to provide you with. I would like to call to your attention that our company stated in the brief that I am responsible for in several places that we were anxious to assist and to cooperate with the committee and that we intended to give every assistance and cooperation that we could. I should like to go beyond the brief and say that we came here with the intention of being frank and honest in the area of assistance to the committee. We have endeavoured to be so, and it is with this quality of frankness in our minds that we simply have no intention of misleading the committee by providing to it information which, to use my words which I know were disputed, could be meaningless, not meaningful, because by so doing we would simply sidetrack the committee from what we consider to be the pursuit of its real objectives. We do not want to be put in the position of providing you with information on an indiscriminate basis, be put in the position of leading the committee down a blind alley. We have stated our position, that whatever information of the type we have expressed reluctance about, that the committee may elicit from any one company, should be insisted upon from all companies selling agricultural equipment in Canada. To do otherwise, that is, to single out one company, would be completely unfair. To single out only those companies who assist our Canadian economy by manufacturing in this country would, I think, be doubly unfair.

I must point out once more that some of the information the committee have been asking for is definitely—and this is reiterating what I said in the transcript many times—definitely of a nature that would give comfort and aid to our competitors. It is one reason we do not like to contemplate that sort of information.

Now, for my last shot at attempting to get our point of view on this kind of information across, ever since this question came up I have been studying as to how we might translate our commercial position into terms that are completely familiar to the members of the committee who are really representing the farmers. I have chosen to use an item of production with which we are all familiar, the item of production being wheat. Our item of production is farm equipment. In the production of wheat, the producer has exactly the same components of cost as we have in the production of farm equipment. I think there are some parallels between the changes which have occurred in our industry and those which have been experienced in agriculture.

You may recall, from the brief personal history that your chairman was kind enough to set forth on my behalf, that I was raised on a farm. Therefore I have to trust my memory, but it should not be too bad.

I seem to recall that about the beginning of world war II the hours of labour required to produce an acre of wheat ran from 15 to 20 man hours. At that point farm labour cost, if I remember rightly, was something in the order of 50 cents an hour.

Mr. KORCHINSKI: You were rich.

Mr. EMMERT: Mr. Korchinski, I have had the experience of working for 15 cents an hour on the farm. At any rate the cost of labour per hour on the farm was very much less than it is today. I understand that today it is possible to produce an acre of wheat for from four to six manhours. It has been stated, and I think it is true—it has been said by many authorities—that the increased productivity per man hour on the part of agriculture has been one of the

phenomena of this century that we live in. These figures bear that out, but in order to provide this tremendous increase in productivity per man hour, the wheat producer has had to make substantial increases in his capital investment per acre, particularly in respect of machines. It has been felt, apparently, on the part of the producers that this is a more economic method than to continue to employ 15 to 20 hours of labour per acre with the increase in the cost of labour per hour. I have no doubt that is a proper conclusion. I am sure that any of you who are farmers, or who are intimately acquainted with farmers, recognize that either you or they have had to make substantial increases in the capital outlay per acre. You have had to make adjustments in your total cost structure in other areas as well as in capital equipment—in the goods that you buy, in the supervisory labour that you employ—either you put in the work yourself or that you employ—in terms of mechanics expenses, that you certainly did not have when all you had was a labourer with a pitch fork and a wagon and all he had to do was grease the wheels.

Now, the data on the cost structure of the production of an acre of wheat—that is, the data on the cost structure relating to a farm study—I call your attention, is reported only by groups of farmers, not by individual competitive units. In fact, I am told that the economists who undertake these farm surveys that provide the information on productivity, on the cost of producing per acre, and so forth, must guarantee that the financial results of any individual farm—that is to say, of any competitive production unit, will not be revealed.

Now, I have made the point before, and I make it again. We would like to think that any company appearing before you would have a similar guarantee from the House of Commons and this committee, as to the secrecy of the information that you may elicit.

If what I have said is true in respect to the privacy of information relating to farms, then I think it follows that it must be even more true in respect to a commercial enterprise that is responsible to thousands and to tens of thousands of shareholders and which has to carry the responsibility of its workers and their welfare.

The parallel, I think, is very, very direct. Farmers have made very large adjustments in capital and labour ratios, and so have we.

The best example in our company of a really forward adjustment in respect to the ratios of labour used, that is, as a capital employed, is in respect to our Detroit tractor plant. In that facility which is now only four or five years old, we think we have the world's most efficient assembly plant. We think we can assemble a tractor with fewer man hours in that plant than in any other plant in the world. But we do that at a very, very substantial capital cost. We do it because it is still to our advantage, and to our customers' advantage, to take that route rather than to absorb the continuing increase per hour of labour.

We also have asserted and we shall continue to assert that decisions regarding substitution of capital for labour must be taken by us. We cannot be second-guessed on that; and that was begun in a very highly competitive situation.

I would like to point out again that this is the same problem that you and your constituents as farmers have, when you attempt to compete with your own neighbours.

We do feel, contrary to the opinion that we may have left with the committee—we do feel that on an industry basis this committee should have full information on the changing cost components of labour and productivity, and of such relevant matters.

Once more I would like to respectfully suggest that an analysis of the data in the annual D.B.S. reports, entitled the agricultural machinery industry,

would on an industry basis yield proper answers to very many of the questions which have been raised. Without wanting in any way to suggest an instruction to this committee, may we present another idea. Your Department of Agriculture economists could render a most valuable service to this committee by analyzing these D.B.S. reports. Personally I am confident, and the group with me share this confidence, that the results of such an analysis, instructed by your chairman and your committee members, would then place the committee in a position to answer for themselves many of the questions which have been raised.

Mr. Chairman, while the hours have been long and not every moment has been absolutely pleasant, I can assure you, and I would like to assure each of the members present, that we leave Ottawa with absolutely no animosity toward the objectives of the committee, toward the procedures that have been employed, nor toward any of the individual members of this committee.

We thank you, sir, for your courtesy and for the courtesy of your members.

Mr. HORNER (*Acadia*): Mr. Chairman, just before the committee adjourns, as the mover of the two motions which have perhaps put the company in an embarrassing position, I would like to try to explain a little further what we are after to some extent and in a general way. I am sure I will not take too long if you would allow this.

The CHAIRMAN: Does the committee agree?

Agreed.

Mr. HORNER (*Acadia*): This whole question of cost came out of the answers,—at least to my mind—which I was trying to get from the annual report. The company lists manufacturing expenses, general engineering expenses, interest and so on. It lumps the cost of goods sold as \$390 million. I tried to ascertain what part of that cost is attributable to material, what part is attributable to labour, and what part to cost of factory burden, such as heat and fuel. In the agricultural implement industry report put out by D.B.S., and subscribed to by a long list of manufacturing firms in Canada—including the three manufacturing firms located in three different spots by Massey-Ferguson—there are statistics. On page 6 it lists for various years going back to 1929, the number of establishments, the number of employees in these establishments, the amount of salaries and wages paid out in these establishments, and it goes on to list the cost of fuel and electricity in these plants, the cost of material to these plants, and the value added by manufacturing. Then it goes on to list the gross sales and value of the products.

In making the motion I was trying to explain and simplify what I thought the committee actually wants. I do not think all companies would have to subscribe to that to the letter, so long as they gave the committee some breakdown of the cost of material, some breakdown as to the cost of labour over the years. Massey-Ferguson must send in statistics to D.B.S. It is against the law for D.B.S. to reveal those figures. It is against the law for D.B.S. to break down those figures and tell the committee what Massey-Ferguson is sending in in the way of costs and materials for those three plants. Therefore, the only one who can actually do this for the committee is the company we have before us.

In my second motion I asked that it be split up into the wage bill, split up into administration, distribution, and actual production. To me this does not seem to be impossible, because the companies send in for this report the total amount paid out in salaries and wages. Surely they have this split in half at least. If they do not feel they can divide it into groups, I suggest we might let them split it up in any way they wish and give the committee some idea as to whether the proportion of cost going into farm machinery, directed towards salaries of employees, has increased or decreased; the same in respect of produc-

tion workers, and so on. This particular company before us has said that the trend is towards lighter more manoeuvrable tractors. So it stems from that that material may be less; I do not know.

I hope that the companies coming before the committee will try to present some of these costs broken down in the way suggested by the two motions. They may not be able to break them down exactly if they do not have the figures available, but perhaps they would break them down in some manner.

Mr. TUCKER: I hope the witnesses will not leave us thinking there are any chances of losing their jobs or that there are members on this committee who know more about their work than they do. Neither do I believe we have members of this committee who are seeking employment with Massey-Ferguson. They are all working here together, having in mind the good of our great agricultural industry.

Mr. HENDERSON: I move we adjourn.

The CHAIRMAN: Mr. Emmert has just one more sentence.

Mr. EMMERT: Earlier in the evening I said we invited your Committee, Mr. Chairman to visit us in Toronto to see something about our company and our engineering test center there. Apparently I failed to make it clear that we would wish you to do this as our guests, at our expense. I have directed Mr. Hickey to work through Mr. Lyons in order to arrange a suitable time. Most sincerely I do hope that as many of the members of this committee as can possibly arrange it will be coming up to take advantage of our invitation.

The CHAIRMAN: Mr. Emmert, I think I can speak on behalf of all the members of the committee and say that we certainly appreciate the very kind invitation to visit your plant in Toronto and see the test center north of Toronto. I hope it will be possible for the committee to accept that invitation, probably some time later on this month. Again, on behalf of all members of the committee, I wish to thank the witnesses for appearing before us.

Before adjourning the meeting I wish to inform you that we shall meet again on Monday May 8, at 9.30 a.m. in this room, when the witnesses will be the Canadian federation of farm equipment dealers.

Clerk of the Committee.

MINUTES OF PROCEEDINGS

MONDAY, May 8th, 1961.
(13)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Argue, Badanai, Boulanger, Clermont, Doucett, Fane, Forbes, Gundlock, Hales, Henderson, Hicks, Horner (*Acadia*), Howe, Korchinski, McBain, Milligan, Montgomery, Muir (*Lisgar*), Noble, Pascoe, Peters, Rapp, Regnier, Smallwood, Southam, Stefanson, Tardif, Thomas, Webb.—(29).

In attendance: From the Canadian Federation of Farm Equipment Dealers: Messrs. A. E. Charette, President; Mr. W. A. Shields, Vice-President; L. L. Sykes, Executive Secretary; D. R. Kennedy, Q.C., Legal Counsel; W. Dickson, President, Manitoba Association; G. C. South, President, Ontario Association; W. J. Allinson, Vice-President, Ontario Association; J. X. Levesque, Vice-President, Quebec Association.

The Chairman introduced Mr. Sykes and thanked him and his President for supplying to the Committee copies of 1961 Official Tractor and Farm Equipment Guide.

The Chairman introduced Mr. Kennedy, who, in turn, introduced the Members of the delegation.

Mr. Sykes presented the brief on behalf of the Canadian Federation of Farm Equipment Dealers.

The Committee questioned the officials of the Federation on their brief.

At 12.00 noon the Committee adjourned until 3.30 p.m.

AFTERNOON SITTING

(14)

The Committee reconvened at 4.30 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Boulanger, Clancy, Clermont, Fane, Forbes, Gundlock, Hales, Henderson, Hicks, Horner (*Acadia*), Howe, Kindt, Korchinski, McBain, Milligan, Montgomery, Muir (*Lisgar*), Noble, Pascoe, Peters, Smallwood, Southam, Stefanson, Thomas, Villeneuve and Webb.—(26).

In attendance: From the Canadian Federation of Farm Equipment Dealers: Mr. A. E. Charette, President; Mr. W. A. Shields, Vice-President; Mr. L. L. Sykes, Executive Secretary, Mr. D. R. Kennedy, Q.C., Legal Counsel; Mr. W. Dickson, President, Manitoba Association; Mr. G. C. South, President, Ontario Association; and Mr. W. J. Allinson, Vice-President, Ontario Association.

Moved by Mr. Clermont, seconded by Mr. Boulanger,

Agreed.—That purchase agreement of Commercial Credit Corporation Limited (*See Appendix "A"*) and Conditional Sales Agreement of Massey-Ferguson Limited be made appendices to this day's Minutes of Proceedings and Evidence. (*See Appendix "B"*).

Agreed.—That regulation regarding Repurchase of Parts by the Company (*See Appendix "C"*) and statements prepared by Dominion Bureau of Statistics and the Department of Agriculture on request from the Committee be made appendices to this day's Minutes of Proceedings and Evidence (*See Appendix "D"*).

Agreed.—That insert to brief of Canadian Federation of Farm Implement Dealers brief be made an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix "E"*).

The questioning of the officers of the Federation was concluded.

The Chairman, on behalf of the Committee, thanked the officers of Canadian Federation of Farm Implement Dealers for their appearance.

At 6.10 p.m. the Committee adjourned until Friday, May 12th at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

MONDAY, May 8, 1961.

The CHAIRMAN: Gentlemen, the committee will come to order. I see we have a quorum this morning, and we are very pleased to have with us this morning the Canadian federation of farm equipment dealers from all across Canada. Before we introduce them, I would just like to introduce the secretary first, Mr. Len Sykes. I have known Mr. Sykes for some years. I have worked with him along with the Ontario group improvement association who staged their big farm equipment dealers shop in the coliseum in Toronto. I am sure that from our end of it we have had excellent assistance from Mr. Sykes, and I am sure Mr. Sykes will give us excellent guidance here today. I would also like to mention and express the committee's appreciation to Mr. Sykes for presenting to members of the committee the official tractor and farm equipment guide for 1961. I am sure members have found that very useful in their deliberations.

The federation has with them today their counsel in Mr. D. Roy Kennedy, Q.C., sitting at the end of the table here. I am going to call on Mr. Kennedy to introduce the members of the federation.

Mr. D. ROY KENNEDY, Q.C. (*Legal Counsel, Canadian Federation of Farm Equipment Dealers*): Thank you, Mr. Chairman, hon members. I am counsel for this group. I shall take no part in its proceedings, but I do want to have the opportunity of introducing to you the representatives of this group who are here today and who are available to answer questions put by members arising out of the statements in their brief.

Mr. Sykes has already been introduced as executive secretary of the federation, and beside him here is Mr. A. E. Charette from Sudbury who is the president of the federation. Then there is Mr. W. A. Shields from Vulcan, Alberta. He is vice-president of the association and president of the Alberta association. Next to him is Mr. William Dickson from Brookdale, Manitoba, executive of this group and also president of the Manitoba association. Next you have Mr. George C. South from Heathcote, Ontario who is executive member and president of the Ontario association; Mr. W. J. Allinson from Kingston, Ontario who is vice-president of this group and vice-president of the Ontario association; Mr. J. X. Levesque from Mont Joli, P.Q., vice-president of the Quebec association.

Mr. L. L. Sykes, executive secretary of the federation and executive director of the Ontario association that includes supervision of Quebec and the maritime provinces, came to the associations in 1955. His prior years in business management and accounting provided him with an inquiring, analytical nature together with first hand experience, for he had administered to five different average farm equipment operations.

The six years with the associations has given him a very broad knowledge of every phase of the farm equipment industry, for his activities included him in assemblies of farm equipment retailers throughout North America as well as the British Isles. It was his privilege to address an annual dinner of the A.M. & T.D.A. in London, England, attended by 500 industry leaders, including members of the European engineers. His ability to serve his employers has been further enhanced for he frequently is invited to participate in manufacturers' and distributors' gatherings and numbers among his vast acquaintances most

leaders in the farm equipment field. Mr. Sykes has toured factories both throughout North America and abroad and has twice been asked if he would attend meetings of the committee of European agricultural machinery manufacturers, usually held in Milan, Italy. We understand that such a suggested invitation has not been proffered to anyone else in North America—most unfortunately his associations' abilities were not such as to finance his attendance.

Mr. Sykes would, therefore, appear to be well qualified to be the steward in this particular instance.

The CHAIRMAN: Mr. Sykes, will you present the brief now?

Mr. L. L. SYKES (*Executive Secretary, Canadian Federation of Farm Equipment Dealers*): Mr. Chairman, hon. members, it will probably be a lengthy procedure. Canadian federation of farm equipment dealers is adequately explained by its name, that it is and does incorporate the provincial bodies of farm equipment dealer organizations. In 1945 when the provincial associations were being founded, the need for a dominion-wide body was recognized and so Canadian federation came into being. At that time the provincial organizations of Alberta, Saskatchewan, Manitoba and Ontario were affiliated. Dealers who became members of their provincial organizations automatically became members of the federation. The obligation then, as it is today, suggested that:—

As a member of the retail farm equipment dealers' association I shall avoid unfair trade practices and shall seek profitable trade upon the merits of the machines I sell. I shall endeavour at all times to promote harmony and better business conditions by striving to be an honourable competitor, a good citizen, and a good businessman.

One of the prime purposes at the time of organization was that some type of licensing of farm equipment dealers be made effective by and through the association. It was further intended that anyone proposing to become a farm equipment dealer must submit to examination by the association. These conditions made for the association a most difficult road ahead for the manufacturers strongly objected to the program of licensing and examination and withheld at that time and down through the years their tolerance of the organization.

A number of achievements can be credited to the dominion-wide organization—their representation at Ottawa in connection with importation of farm equipment, as well as farm equipment parts; dealer problems involving major manufacturers have been presented before the supposedly offending company. Most valuable perhaps, has been the annual meetings bringing together farm equipment dealers from the provinces for an annual examination of their activities within the industry; the exchange of views and programs as they have applied to the retailing industry throughout the country. Stabilization of prices was one of the early problems recognized by the association and since as time passed the licensing ideas moved into the background, Canadian federation endeavoured to provide assistance to all dealers across Canada; a yardstick for trade—the trade-in-guide, produced annually by the association which obtains the suggested list prices of the major pieces of equipment from the companies and publishes these in book form, together with serial numbers and a scale of values for trade-in goods. This book is widely used by dealers, manufacturers, even appraisers, insurance companies, banks and many others, in their daily business involving farm equipment.

The provincial associations lay claim to numerous services to the dealers and the industry. They provide protection for the dealer, his employees and their dependents through group hospitalization and life insurance. Some assist the dealers in their general insurance coverage, also on a group basis. They

continually keep their membership informed of unscrupulous "fly-by-night" dispensers of agricultural products. They encourage and support group meetings, bringing together the farm equipment dealers on a common ground to discuss and resolve their day-to-day problems. Educational programs are provided, as well as materials gleaned from myriad sources, all tending to assist the dealer in his day-to-day activities. Excursions to the British Isles have been sponsored by the association to provide the dealer with better understanding of the manufacturing of goods, to see foreign types of goods and to generally examine the methods of others. Annual conventions are held bringing together top executives of manufacturing and distributing who exchange their ideas with the dealer groups to further encourage better business understanding and practices.

At Toronto, annually in January, an association sponsored display of farm equipment and allied items is held. The purpose here is to encourage all manufacturers to present their latest designs and developments for the viewing and examination of the farmer who is invited to compare and evaluate that he may decide the machines and equipment best suited to his individual needs.

This provides an opportunity for the dealer, as well, to acquaint himself with all the equipment other than the particular machines that he himself handles.

This is an over-all effort designed primarily to assist and familiarize all who participate.

The true value of the trade-association may be a debatable subject even by those who work closest to its efforts. In 1952 and 1953 the work of the various organizations in Alberta and Saskatchewan in the interests of farm safety aroused Canadian federation to the realization that other provinces were sitting idly by while the farm population were being allowed to maim and kill themselves indiscriminately through lack of education and care. A farm safety week for all of Canada was sponsored by the federation in 1956 and has continued.

Our association, in cooperation with the Canada farm show, produced and distributed three one-minute short films on the subject of farm safety during the week, July, 1960. The cost of \$2,000 was deemed to have been most worthy since 65 Canadian and 3 U.S. television stations used these items throughout farm safety week.

This has encouraged and aroused considerable activity where previously none existed.

Numerous times, in fact all too numerous, needs for the dealers have been recognized and promoted either by the federation or the provincial association, only to find that original intentions or developments were snatched from them and put to use for the glorification of others who were bigger or better financed.

In 1958 the farm equipment dealer did not have a situation that permitted him to compete on an equal basis with the automotive dealer. He was actually unable to sell his investment-recovery machine against the luxury pleasure-providing automobile all because of the limited finance program available; farm improvement loan through bank and government or a form of finance offered by his own company. Farmers desired to retain the farm improvement loan privileges for cattle transactions, feed and seed purchases or both. The company plan, if used, excluded the dealer from his volume or cash discounts. None of the numerous finance companies accepted farm equipment because of what they claimed the high risk involved. The farm equipment dealer could not say to his prospect: "For \$55 and your trade-in you can take home that nice, shiny, new tractor", as could the automobile dealer.

The association in its efforts to serve, sought either to establish or to secure a company dealing exclusively in a finance program fitted to these needs. There are associations who did operate, for want of better, such a program.

The Canadian farm equipment dealers found in May, 1959, that a new day was dawning, for through the association's determination, the needed company was found and began operation. The company's experience to date indicates the acceptance and value derived.

Only a very short period of operation, however, was necessary until the major companies overhauled their finance plan and the dealer was well advised to return to its use if he wished to retain the company's blessings. Absolutely no monetary return of any kind from any source reached the Association. It is also interesting to note that today most finance companies are in, or desire to be in the farm equipment field.

Again, the association noted the desperate need for business management instruction for the dealer. While the association has provided a bookkeeping system for dealers for several years—such systems will not operate themselves. Again there are associations who have provided such educational programs, even in farm equipment for several years, successively too. The Canadian associations accepting experienced advice from those who are operating, endeavoured to do a better job—profiting by the experienced recommendations. In May, 1960, such a program was instituted—it was generally conceded that here was the best instruction course of its type ever produced. Companies were invited to contribute thoughts, ideas and suggestions, even given the privilege of allowing, if they desired, certain of their own preferred systems to be taught to their own dealers. No noticeable assistance was forthcoming from those who make farm equipment dealers. The dealers, apparently, unaware of their own needs failed to avail themselves and after about eleven months the association was unable to finance the project.

Here again recognition of the need was made evident and today two companies have embarked on a similar plan for their own dealers exclusively. Nothing in the teachings could be construed to be detrimental to any company and by the association fostering the program for all, the needed volume would have been possible at a much smaller cost. The association has no quarrel other than that all efforts must be financed and should be done as low as possible for somewhere, sometime, someone must pay.

A dealer member is encouraged to enjoy any service that he may require; such as, representation to his distributor; information on legislation; municipal, provincial or federal, from his association. He knows that the employees of the association as well as the elected officers are deeply concerned at all times with all matters pertaining to his chosen vocation of farm equipment retailing.

Farm equipment dealers arrive at their vocation through a diversified number of channels; some following in the father's footsteps, others by chance because of inherited desire toward mechanical things. There are those who because of their personal ability and strategic location in the community were persuaded to be farm equipment dealers by an enterprising manufacturer. More frequently, perhaps, we find that the farmer who found that he could no longer operate a farm because of health reasons, or otherwise, realizing that his only background and training was in things agricultural, turned to the providing of supplies to his farm neighbours when required.

It has been frequently mentioned within the industry that "so and so" was a better horse trader than anyone else in the district. If we refer to graph No. 1 we will realize that with the passing of the horse, the horse trader, of necessity, had to look to other fields.

With this background and the daily involvement of the person in this business, there would seem to be little doubt that the farm equipment dealer is the man closest to the farmer himself.

From the first sign of spring until the first fall of snow the farm equipment dealer must be alert and available almost 24 hours a day, seven days a week. He must be first at his place of business in the morning and before

anyone of his farmer customers require something from his shop. Now in this age when it is no longer necessary to work on the land during daylight hours only, for many use their tractors and equipment, lighted late into the night, he must, therefore, anticipate requirements well into the late hours of the evening. Pity the farm equipment dealer who lives within 10 miles of his place of business, for numerous will be the rappings on his door, on Sunday or at any other time during the day or night that he fails to have his business door open. It is even possible to refer to this business man as you might to a doctor—always on call.

He is frequently required to attend ailing equipment on the back 50 acres, miles from the service shop. All of these exacting demands must be performed by the dealer-owner-manager-salesman-serviceman and jack-of-all trades for he, many times, because of provincial labour laws is not allowed to delegate after hour work to employees. This is his life as he, himself, has chosen it.

The prospective farm equipment dealer, either through his own desire and inquiry, or not infrequently, because of the interest of some major manufacturer, begins to negotiate the obtaining of a franchise to handle farm equipment. Most dealerships revolve around one major line of equipment, i.e. Massey-Ferguson, J. I. Case, John Deere, etc. It is then necessary to satisfy the major company that the prospective dealer has the rudimentary qualifications; a good reputation in the community, financial stability, together with honesty, fair sales ability, some mechanical background and generally, some business ability that would fit him for management. His location must be well placed in the district and it is advisable that he have premises suitable to display both outside and in, a proper setup for storage of parts and suitable premises for service which, of course, will necessarily have to be equipped.

In this year 1961 the tendency is to seek a location, preferably on the outskirts of the village or town, on the main travelled thoroughfare.

From condensed survey results we can see the classifications of dealerships and various information pertaining thereto. In the majority of cases the major companies are not too demanding in their requirements at the outset, but none the less the more attractive the situation, the more anxious the company. One of the greatest difficulties perhaps is the number of major companies all seeking representation in every district and so there are times when we have far too many farm equipment dealerships within a given area. Tremendous strides have been made in mechanization and improvements within the farm equipment industry. However, there might be doubt as to all things having kept pace with this progress. Dealerships over the years have been established in profusion, but such a procedure should be defended for it was purely to provide the service being demanded by the customer. The number of dealerships suggests that while they were established for convenience sake within driving distance of each other, it is to be regretted that the mode of driving was by horse and buggy. Today with the accelerated method of driving—automobile—this leaves the industry with a superfluity of outlets.

Competition, they say, is the life of trade, but it has been noted that because of an overabundance of supplies, competition becomes a 'price war'.

It should be noted that some companies today failing in their efforts to secure a dealer locally, open what has become known as a company outlet or company store. In past years, from time to time, there has been a rise and fall in this program of a company marketing its own goods. At one time, some years ago, all major companies in the United States opened and operated a number of their own stores. This appeared to be a concentrated effort unsatisfactory method of selling.

The present day practice in Canada appears to be a revival of that condition and there is doubt as to its service value. It very definitely is detrimental and has such an effect on the farm equipment dealers covering a very wide area around such a place of business in that it increases competition to a great extent, even affecting the particular company's own franchiseholders. Here we have salaried employees seeking volume sales and a profit picture to justify their existence to head office, working in competition with the free enterprise dealer. Our way of life today, however, excludes patience, time loss and restraint of any kind and we see the farmer-customer looking for, in fact, demanding immediate service and he is gleeful if he has a well established dealership next door to his farm operation.

The dealer receives his machines—tractors, combines, balers, etc.—from the company branch or warehouse, either by rail, transport, or in some instances, his own trucking facility. In the majority of instances, these goods are provided on a consignment basis, payable when sold, or a form of settlement in a given period—perhaps 10 per cent of the cost in six months and a carryover of the balance for six months, or some such individual arrangement.

October 30th is the time of year that by mutual agreement the dealer and his company review his season's activity; they appraise their positions. This is known as "settlement time"—the time of accounting and payment. Because of this settlement time we sometimes find that the dealer must hasten to meet his payment date; in other words, this is the time when he needs money and also the time astute purchasers do their shopping. The dealer in order to meet his demands will unload for a price.

Along in November—again this applies to most companies—the company district salesman or blockman as he is known, visits the dealer to book his spring order. This is frequently based on the past season's sales or the previous year's pre-season order. There is a slight inducement in this connection in that the dealer is not committed to any payment, but he is required to accept deliveries as stated. This practice might suggest a certain dependency by the manufacturer upon the dealer in just what the plants should produce in the year ahead. The average discount, company to dealer, on machines amounts to 20 percent originally; with a further spread of 4 percent in connection with volume, cash or special sales.

Let us here emphasize the matter of *volume sales*. This is something of a bug-a-boo to all Farm Equipment Dealers for they are continually under pressure from the manufacturer to secure a higher volume bracket.

May we at this point return for a moment to the qualifications again of the Farm Equipment Dealer and his training. Once he has become a franchiseholder of a major manufacturer, he is *called* from time to time (we emphasize called, rather than invited) to attend company-sponsored meetings. For the most part these meetings are sales schools; as well as instruction and training for the purpose of increasing company volume, yet flavoured with an atmosphere of training for the Dealer. Companies also have schools, known as Product Educational Schools. These are to acquaint the Dealer with the particular abilities of his company's machines over that of competitor equipment.

Of late years, some companies have, and in some instances because of other companies' practices, taken large groups of their own dealers and sometimes dealers of other companies, on extensive visits to far away places under the guise of product education to display the latest developments and new models. When the entertainment and trip is over the Dealer sometimes finds to his consternation, that he has signed a sales order for a much larger amount of goods than he can conveniently handle.

Service Schools are conducted by the companies, and Dealers are encouraged to send their personnel so as to keep informed on the mechanical functions and services required for their own company's equipment. Like the automotive industry, however, the Farm Equipment Dealer's Shop is required to work on the variety of equipment found in the territory. The farm equipment dealer is required to pay the costs involved of his visit or that of his employees. Oftimes such schools are located at the factory, not always in Canada. This practice applied to dealer-customer welfare is commendable; however, the dealer is assessed, either at the time of the school or later on a monthly invoice, for the costs of the school or program. When we examine the individual dealer's advertising costs, we would do well to realize that while the localized advertising is not too great, a tremendous amount of high-cost advertising space appears continually, month after month, with the suggestion that this is company promotion—much of it is, but also we find that the dealer's monthly invoice from his company contains a pro rata amount assessed on him on the basis of his sales to support this general advertising campaign.

Further along an insert will be found that deals with the farm equipment dealer's sales program and since this information contains the other functions of the farm equipment dealer related to sales of new equipment we will endeavour to explain some of these points.

First of all, it is a rare occasion any more when the farm equipment dealer will make an outright sale of a piece of new machinery, i.e., tractor, combine. There usually lurks somewhere a trade-in of a piece of used equipment. The farmer-customer rarely, if ever, relies upon only one quotation. In fact this is that particular place where his horse trading ability comes to the fore. It is a common practice for a farmer to visit a farm equipment dealer to inform him that he has been offered, for example: \$800 allowance for his trade-in tractor which actually is worth on the open market only \$500. It is quite easy to understand that if he has been offered \$800, he seeks \$900 or more at this point.

It is not uncommon for the farmer when he fails to have a piece of trade-in equipment himself, or is unable to resurrect one, to seek from his neighbours something that might be used for trading purposes. Because of the number of dealerships, the wide variety of goods and so on; in fact, too great competition together with our modern methods of travel, the customer has a wide choice of deals and is able to apply astute bargaining at all times. It cannot be stressed too strongly that the farm equipment dealer seldom, if ever, realizes anything near the suggested list price of his machine, if he succeeds in getting the deal. Frequently also, the customer suggests that his tractor is of 1955 vintage, but when the dealer, using his trade-in-guide, checks the serial number, he finds that he has a machine of 1954 or possibly 1953 manufacture. Also, the condition of the trade-in machine may prove to be such that extensive repairs and overhaul is necessary before it can be offered for sale.

Over the past 3 years the farm equipment dealers who are located in the proximity of border points have found themselves in a most difficult situation. The farmer learning of huge monthly auction sales of equipment being held at points in the U.S.A. journeys to these sales and bids what he feels is a good tractor at an auction price. The machine is trucked across the border to his home farm where, after a week or so, he finds that all that 'sparkles and shines' is not sound efficiency. The machine's tires are filled with tar, now revealed by the constant heat of the sun's rays. The ether doctored motor no longer responds to the starter. The farmer also finds that his local dealer is not stocked with parts for the machine because it was a U.S.A. original and is not always similar to the products provided by the Canadian farm equipment dealer.

The original need was for a tractor on the farm and so a deal is sought at home from the local area Dealers, but here again we have the farmer seeking

to secure in trade-in value more than he paid at the auction, plus the costs of his day out at the sale and the transportation of the equipment to his home.

It must also be conceded that the farm equipment dealer, in some instances, has also sought to augment his used equipment lot by visits to those out-of-the-country auctions. He too has found that after closer examination of his purchases, considerable overhaul and service was necessary before he could conscientiously offer the equipment for sale.

Two other factors in this same connection plays a role in the Canadian farm equipment marketing program. Cattle truckers with a one way load to U.S. points secure a return load by visits to the auctions and later peddling this equipment up and down the country. There are also those U.S.A. truckers who make a business of dickering in this kind of equipment on sorties into our Canadian territory.

Not unlike the automotive industry, sales are sometimes made to fair thinking customers on the merits of parts availability and service qualifications.

Parts arrive at the dealer's place of business usually on a cash 30 day basis. A good dealership maintains good parts records, handy distributions and good counter service for which he must employ a fulltime man for dispensing of these items. A tremendous amount of care, handling, planning and thought must be put into the dealer's parts management; not to mention a fair investment. If he is to be prepared for the busy season and meet his obligations to his customers he must be well stocked. If he is a dealer of long standing, from his records, if he has been able to employ competent help or devote enough of his own time to maintaining of these records, it may be possible to anticipate the season's needs. Time changes many things. We have seen an overabundance of distributing depots. We have seen a scarcity of such. Both can be damaging. Where the company has established too many such places, it is inevitable that their costs will be high. Where there are too few, there can but be times when there will be delays.

In the last 2 or 3 years there has been a reduction by some manufacturing organizations in such distribution depots; consequently, we would expect reduction in cost of maintenance. Farm people might well suggest that there should be reduction in parts costs to the ultimate user. Let us realize that the greater the distance, the greater the dealer's responsibilities. In instances of this kind, the company insist that the dealer in November place a parts order sufficient to meet his requirements for the entire season ahead. The supplier requires that this order be at least 60% of the previous annual parts purchases.

Most companies permit the dealer to return unsold parts, 6% net (dollar value) of the previous year's total purchases for which he will be re-imbursed on the basis of 50% of the invoice price, i.e. \$10,000 parts purchase, \$600.00 return parts, re-imbursed \$300.00. This does not apply to obsolete parts that may have accrued in the dealer's stock. The recommended disposal in this instance, is that they be sold by the dealer for scrap.

The closing of a branch or discontinuance of a supply depot makes it imperative that the dealer's overall requirements must be stocked by him where he previously relied upon overnight delivery from the branch when it existed.

Warranty policy on equipment is not as definitely established as we recognize it in the automotive industry. There are statements to the effect that warranty will be provided for a period of one year or a certain number of working hours. Here the dealer is required to do the warranty service and supply the parts. A variety of re-imbursements exist; in some instances, the part that failed must be returned to the company in order to get credit for the new piece, or in some instances, the blockman has the authority on his visit to pass on warranty parts. In some instances, arrangements are to re-imburse the dealership 50% of the usual labour charge.

This is quite commendable, possibly in principle, but utterly fails in practice. At the height of the busy season, understaffed as most dealerships are, records are far behind and not sufficient time is devoted to close tally of warranty parts and labour. Something else creeps into this practice, however. Most dealers are close friends with their customers, so much so that the customers presume upon this friendship to extend far beyond the warranty period, service and repairs for the equipment they have purchased from the dealer. Dealers have stated that they have been asked to service a machine gratis that they had sold 5 years before. The sales record indicated that over-allowance was rampant at the time of sale as well.

We might well take a long and serious look at the service end of this business. Unlike the automotive industry, mechanics in the farm equipment shop are not required to have a licence, or possibly it might be best to suggest that the farm equipment mechanic is not provided with a certificate of merit commensurate with his ability to do a first class mechanical job. We, as an association, may be guilty of offence in this matter in that we have not pressed for such certification. Let us for a moment remember that the farm equipment dealer, himself, had certain mechanical background when he became a dealer. He, no doubt, obtained or secured through his company, and possibly through others, quite a good training in his work. Again we must realize that the dealer himself cannot be all things in a dealership and so seeks out employees. There are mechanics holding automotive licences who prefer working on farm equipment, or through circumstances, find themselves serving the farm equipment industry.

The difficulty the dealer encounters, however, and this has been very intensive since the introduction on a much greater scale than previously, of diesel type tractors is the securing of a top-quality, experienced mechanic in his more or less isolated location. Such a mechanic can secure a much higher income in larger centres and usually prefers such a location.

Let us look for a moment at the dealer-mechanic relationship. It has been generally conceded in the past that a business employing a mechanic at \$1.50 per hour would normally charge \$3.00 per hour for his labour time. Generally speaking the average citizen would immediately say that the dealer is making \$1.50 per hour for the labour sold. This most certainly is not the case as the following illustration based on sound information will imply.

ACCEPTABLE RATES

If we have an average mechanic in our shop working 48 hours per week at a wage of \$70.00 per week or \$280.00 per month, your actual cost of having this man on your payroll is as follows:

	Per Hour
Mechanics Wage	\$1.50
This is on an hourly basis. (\$70 per week for 48 hours)	
Dominion holidays (7 days/yr.)037
Annual holidays (10 days/yr.)052
Coffee breaks (30 mins./day)094
Group Insurance & Unemployment Ins.052
Unassigned time (1 hr./day)188
<hr/>	
Total Direct Labour Cost	\$1.923

The above items are all essentials, whether or not they are generally admitted or recognized. The suggestion is that there remains but \$1.077 from labour sold to support shop overhead: equipment depreciation, new equipment purchases,

supplies, heat, light, etc. Only a very small percentage of dealers themselves are aware of this situation and because of this, are not any better informed than those who feel he is realizing a high profit on labour sold.

Also, not all labour time can be sold, but must be devoted to internal reconditioning of used equipment and, of course, this is where we derive part of the resale price involved in the used equipment sales. One of the other problems amounts to the fact that there are high and low periods. It may be quite possible for the farm equipment dealer during the production season to pay a reasonable steady wage to his employees, but what about the off season situation? Work is slack, income is low, regardless, costs continue.

Two factors appear here: One, the farm customer who delays his overhaul and repair work until the peak season when he by his delay not only interferes with the dealer's operation, but reduces his own efficiency, certainly at a very high cost to himself. The association has provided to its membership suggested advertisements for use in their local papers during the winter months in an effort to encourage pre-spring get-ready. Generally speaking and from survey, the reaction of the farmer is not too gratifying.

The dealer in his desire to meet the demands of his customers, which all too often have no rhyme or reason as far as hours are concerned, secures from the proper government department permission to use his employees' services beyond the normal working day. In such circumstances, of course, the employees require additional compensation—time and a half at least. It is regrettable that in such circumstances, farmers' main objective is to get the job done while he himself is sleeping, if possible, and at the lowest possible cost.

Most of us are familiar with the average farm equipment dealer. Survey figures in our early graph indicates that the farm equipment dealer is not dependent upon his major company franchise only. It has long since been realized that, particularly in Canada with a one crop season, farm equipment dealers must have other items and in most circumstances these are things auxiliary to agriculture: water systems, poultry equipment, barn and stable requirements, fertilizers, insecticides, in fact seeds and sometimes feeds as well, dual dealerships with an automotive franchise. All these things are necessary so that the farm equipment dealer may hold together a general operation and provide employment for a normal staff over a 12 month period.

Working capital in any business, great or small, dictates that particular operation's ability. Farm equipment retailing is not, first of all because of its necessity to be relatively close to the consumer area, inviting to the investor. In fact, it is not too attractive to the man with an amount of money sufficient to an extensive operation. Dealers overhead and cost of operation frequently preclude sufficient employees to adequately serve the needs. In a recent instance, it was proven that the addition of a much needed salesman demanded so much extra that operating costs were placed in the prohibitive bracket in accordance with the ruling of the firm's accountant. This then directed that the owner must assume the salesman's responsibilities. Much too often similar circumstances does not allow the employment of even a bookkeeper or a parts man. This is because there just is not sufficient income. A situation that might in time rectify itself, but there is not the necessary capital to embark upon such a program.

Here then we see the farm equipment dealer and one mechanic doing their best to be all things. It is surprising how many times the dealer's wife is pressed into service as dispenser of parts or bookkeeper, when she is already overburdened with her household responsibilities and not experienced in the duties she must perform to support her husband's occupation.

There are as well some items in the implement end not provided by a major company and so in the industry we have what is known as 'short-line companies'. Usually the short-line companies do not have tractors, but may

as The New Holland Company and The New Idea Company provide balers, dryers, etc. Even beyond that we have manufacturers working through distributors who provide smaller items or specialized equipment.

These are all prospects for the farm equipment dealer and so there are times when the farm equipment dealer's reception office is well filled with travellers with no end of goods at wholesale. Normal rates of discount applied in these instances are similar to those previously mentioned; in fact much of the smaller items provide less discount, but it all provides the stock in trade of the farm equipment dealer.

Complete harmony within the suppliers does not always exist. There is much competition and rivalry to obtain the services of the best dealer in the area to handle these extra lines. Nor does the major manufacturer who has permitted the dealer his franchise entirely enjoy his dealer handling things, other than those he provides. There has been from time to time a program bringing pressure to bear upon the dealer to discontinue this offering of short-line items. Such pressure has been severe. Representation has been made in an effort to allow the farm equipment dealer to conduct his business without interference. Circumstances in an area does at times dictate what lines the farm equipment dealer will offer. He endeavors to meet demand.

We have noted with considerable interest that from time to time there is a hint that major manufacturers may be involved in a type of combine where farm equipment prices are concerned. Experience suggests to us that this is most doubtful. It has never appeared as if the companies have actually worked in harmony, as is prevalent in other industries.

An instance is known where 5 different blockmen did in the course of one week visit a franchise holder in an effort to secure his services for their particular company, to the exclusion of the franchise he already held. Each of these blockmen, and this can apply to dealers as well, are so deeply indoctrinated with the quality and ability of their own particular equipment that their friendship for each other is certainly superficial.

While there are no closed territories for the farm equipment dealer, there is an understanding that he has 'such and such' a territory. On one sale—a farmer had been approached during the same morning by a blockman, in company with his dealer located 3 miles to the west while later, the company blockman and dealer from 3 miles to the east, visited the prospect—all from the identical company. This is competition at its height.

Also existing in the industry is the pirate dealer who has possibly slightly more employees than he needs, plus a large transport truck. This dealer, handling "A" company lines, on a slack day would instruct his driver salesman to load a couple of tractors and journey on a seeking mission. Oftentimes the trip penetrates as far as dealer "E" handling "A" company's line. Before night-fall it has been possible to dispose of the tractors from the truck for the peddler has been able to offer a more attractive price because he knows that a tractor 100-150 miles distant from the original dealer will never require warranty service. Dealer "E" sooner or later is required to attend for service a machine from which he never did realize a penny.

It is generally conceded and common knowledge that farm equipment is big business. It may well be true, however, that our ability to properly comprehend the situation is buried in that huge pile of statistical figures. While the great number of surveys, graphs, diagrams, etc. points out to us that the farm machine population is both tremendous in number and extremely high in dollar value, we should take a close look at how it arrived at this position.

The process of providing can be visualized as a bucket brigade, each piece passing from hand to hand and when we realize the large number of farm equipment dealers who have played so many roles; none of them so terribly big, but all necessary cogs to the wheel, we might consider what is involved.

Using for comparative purposes 41 lines in the retail trade endeavor, the cost of goods sold by the Farm Equipment Dealer is exceeded only by 3 other businesses, while his gross margin of 18.67 per cent is less than 37 of these other business operations. His net operating profit of approximately 3.4 per cent, in this instance, is on a par with 12 like operations and is exceeded by 11 others. The highest being 11.2 per cent. The Farm Equipment Dealer is required to carry bad debts greater than 34 of the business organizations being used for comparison purposes. His inventory turnover per year is exceeded by 31 of these operations. When we look at the owner's compensation for his efforts, we find him at the extreme low of 2.2 per cent, and in this instance, he is exceeded by everyone of the remaining 40 business operations. (This information is taken from Dun & Bradstreet Reports.)

There have been good and not so good years in the past. There have been high points and low points; times such as war years when equipment was in short supply. The peak sales years 1948-1953 may have been the golden years for this was the transition period of mechanization; a time and condition not likely to re-occur for ahead now is the replacing of the worn out or obsolete equipment.

The dealer must remain to service, repair and provide parts for what he has supplied in the past. Yet, unless his profits have been such, and this is most doubtful, to provide him with adequate resources to cope with reduced sales he surely faces a problem. This condition is being felt generally throughout the industry. Many manufacturers, in whose hands the fate of the dealer remains, are today closing out the dealer who fails to reach a satisfactory volume condition. Emphasis here is the fact that a man who possibly has spent 25 years in the business must either find another company or another job.

The farm equipment dealer differs not in many respects to his fellow business man or, in fact, the average citizen. Costs generally have risen over the years:—labour rates, equipment, service equipment, repairing tools, management and accounting devices, insurance, light, heat and even water rates are much greater today than ever before. All these factors contribute to overhead generally and to business in particular. All too often the individual in his thinking fails to realize, even though he is well aware of his own situation, that regardless any action—even thought—costs someone money. This is so very true when the farm equipment dealer thinks that he might sell a tractor to a customer 10 miles away, but after making the trip, taking his time and the expense of travel, he finds that his competitor has been there first.

It is the thought of this organization in presenting this information that they should endeavor to refer to as many conditions serving the retailing of farm equipment as possible. There is no intention, premeditated or otherwise, to expand in any way, shape or form, beyond the functions of selling and servicing the equipment offered to the farmer. The Dealers of Canada are quite well aware that they, like all human beings, are not infallible; that there is room for improvement and the possibilities of a new or better way of doing their job. They would, therefore, at this time offer some thoughts and suggestions in an effort to be of assistance.

RECOMMENDATIONS

Suggestions have been made that testing of farm equipment might help. At present and for years past, Nebraska test figures have been used and generally accepted. Canada might well serve both farmer and the farm equipment dealer by the establishment of one central testing centre. The benefit to the dealer of such an arrangement would be the proof and independent opinion of the ability of his equipment to do the job as so stated. Such a centre might well prove most valuable by the expansion of its services to include the general

training and eventually, certification of the people involved in mechanical service within the industry. By adopting a general school through which one day all mechanical personnel should be required to pass, education and experience would not be confined to one line of equipment alone.

Since the farm equipment dealer, in so many cases, plays such a multitude of roles, this same national centre could serve industry by a further service of management and accounting training. This would facilitate record keeping, bookkeeping and overall supervision of so many factors that contribute to good business. Uniformity in this connection would surely tend to increase the general ability of the people serving Agriculture.

As conditions are at present, the farmer seeks out the farm equipment dealer who has exhibited particular ability to advise him in connection with the use of not only equipment, but fertilizers, insecticides and many of the other modern devices today being used on the farm. If this is so, will not the demands upon the farm equipment dealer increase as years go by and should he not prepare himself for such an eventuality? It would, therefore, appear that in addition to the services previously suggested for the centre, we might well add short courses in a great number of other fields.

The Association cannot stress too vehemently that for much too long the customer has been permitted to price the salesman's goods. Not in any other industry do we find the customer telling the clerk how much he will pay for the article. The fault, in this instance, may well lie with the dealer for a great variety of reasons:—insufficient knowledge of the costs of his overall operation, demand by his suppliers for volume sales, much greater competition than is actually necessary and last, but by no means least, failure by the Dealer to recognize his own requirements.

This suggestion that a form of licencing might be helpful does not particularly appeal, once again, to the free enterprise merchant. Much better he be regulated and supervised through a capable establishment concerned with his welfare. Too often licencing machinery fails in its operation by permitting for dollar consideration a licence to be issued, rather than on the basis of merit.

Adequate parts depots provided in accordance with the present suggested demand might well mean that every farmer would want to have a parts bin in his machine shed stocked with all the parts that he might need during a season's operations. Naturally this is quite impossible. On this basis who would be fortunate enough to find himself next door to the established depot and how many would not be satisfied? By the same demand who would pay the cost? If it is suggested to the manufacturers, it is our humble opinion that the cost of establishing and operating such a depot would most certainly eventually wind up in the retail cost to the farmer.

If at this time might be permitted a slight latitude we might refer to the provided information that there is a much greater import of equipment for Canadian use than there is of equipment manufactured within the confines of our own country. We would quite naturally expect that preceding presentations have justified this situation and again we have no quarrel with such a situation for we are well aware of production costs and their contribution to the eventual suggested retail price. If those who manufacture outside our boundaries and provide their equipment for our use, are assisting us by incorporating into their product raw materials which are available from Canada and it is possible for them to provide equipment on an equal basis with that manufactured by our own people, then the entire operation should be justified.

There may appear throughout this presentation an overabundance of problems concerning the farm equipment dealer. The intricate involvement of outside interests and contributing factors would seem to require intense explanation. Should the farm equipment dealer now appear, because of this presentation, to be other than a hard-working, public-spirited, free enterprising

businessmen, then it was purely coincidental. Business today is beset by no end of annoyances and problems and only intelligent, astute application of management can successfully pilot any business to the port of success.

Our presentation has as its purpose to explain, if possible, all those things that are involved and encountered by the farm equipment dealer in his daily occupation of selling, servicing and supplying the tools that increase the efficiency of farming across Canada and make that tremendous task easier, more profitable and more abundant for his efforts.

The inked-in marginal numbers will indicate the application of the point being discussed to appended material bearing that number. Appended materials are provided in an effort to assist a better understanding of the statements made.

Thank you very much.

The CHAIRMAN: Thank you, Mr. Sykes.

Gentlemen, we are now ready for questions to be directed to any of the witnesses who are here this morning.

Mr. HORNER (*Acadia*): First of all, Mr. Chairman, I would like to thank the Canadian federation of implement dealers for bringing before this committee a very full brief, which is documented by facts and figures. I am sure that it will be of great assistance to the committee.

My first question, Mr. Chairman, is in connection with a sentence on page four in regard to finance companies. You made the statement that a finance company was found and that this, more or less, brought the major companies into line, and then these major companies developed a plan to which most dealers were advised to return to if they wished to retain the company's blessing. You also mentioned in there that most finance companies are in the farm equipment field. I am wondering what finance company was found, and if you could give the committee some idea as to the names of most of the finance companies now in this field. I believe that most of them may be known generally—companies such as Traders Finance, General Motors Acceptance Corporation and so on. Would these companies all be in that field now, or could you give the committee some idea as to which ones are?

Mr. SYKES: The situation at the outset, sir, was that the risk was too great. For instance, a man would buy a combine, put it on finance, do custom work all fall, and when the season was over, he would leave it in the field and refuse to make his payments. The finance companies felt, as I say, that the risk was too great.

There was a finance company operating in the United States, namely, Dearborne, which later became Commercial Credit Corporation, who specialized in this type of financing. That is the company which we and others were instrumental in inviting to come and do the job for us in Canada I.A.C., these other companies you mentioned, as well as others, were the ones which did not care to participate to any great extent. However, today they all have developed an agricultural plan, but I may say this has only occurred within the last few months.

Mr. HORNER (*Acadia*): I have a further question. What percentage of the farm equipment sales are through company finance and, by "company finance" I mean either the farm implement companies or these other finance companies.

Mr. SYKES: May I ask Mr. South to answer your question?

Mr. George C. SOUTH (*President, Ontario Association, Canadian Association of Farm Equipment Dealers*): I would suggest that company finance companies and people like Commercial Credit are handling about 75 per cent of the financed farm equipment, and the other 25 per cent is probably being held by farm equipment loans.

Mr. HORNER (*Acadia*): A further supplementary question: Would they also handle used equipment?

Mr. SOUTH: Oh, Yes.

Mr. HORNER (*Acadia*): They do?

Mr. SOUTH: Yes.

Mr. FORBES: I have a supplementary question, Mr. Chairman. What rate of interest would these companies be charging in connection with this financing?

Mr. SOUTH: Compared with farm equipment loans at a straight 5 per cent simple bank interest, finance companies would probably charge 7 per cent on the finance type of interest, and the regular finance companies probably 1 per cent higher.

Mr. KORCHINSKI: You suggested that 75 per cent of the sales were through finance companies. What reason do you suggest for this? Is it the inadequacy of the farm improvement loan, or is it some other reason?

Mr. SOUTH: I think there are a number of reasons there. One reason is that many farmers have gone the limit on farm equipment loans; in other words, they have borrowed all the money their local bank thinks they should have. Other people like to keep that as a backlog for cash purchases of cattle and that sort of thing. We have a lot of people who do not qualify for those loans and, one reason for this is the fact that they may have some other job off the farm, which would disqualify them for the farm equipment loan. Also, there is the matter of industrial equipment, which most of the farm equipment companies handle now.

The CHAIRMAN: Have you a question, Mr. Muir?

Mr. MUIR (*Lisgar*): Yes, Mr. Chairman. I have a question in respect to another matter.

Mr. ARGUE: Mr. Chairman, before we leave this question, I have a supplementary.

Could the committee be given some samples of the kind of contracts that may be signed with finance companies? There is always an argument as to what the actual interest rate happens to be. The superintendent of insurance would give you a certain answer, and I am sure the companies would give a different one. It would be very helpful to the committee if we could be given two or three sample contracts which would show the interest rates that are, in fact, charged by these loan companies. I would guess that the 7 per cent would work out pretty close to that amount in terms of simple interest, for the total cost involved. It is important that we know this, particularly when we do have an alternative credit policy of 5 per cent through the banks themselves, which is much cheaper than this other kind.

Mr. SYKES: Have you any sample copies with you which might be given to the committee?

Mr. SOUTH: I do not have any at this time, but I would be glad to supply you with that information.

Mr. KORCHINSKI: I think, Mr. Chairman, that Massey-Ferguson submitted their sample form for the committee.

Mr. MUIR (*Lisgar*): I know they had one with them.

Mr. KORCHINSKI: I was under the impression they were going to leave it with us.

Mr. ARGUE: Mr. Chairman, the reply was that they would be quite happy to supply these. If they could be supplied to the chairman within a reasonable period of time, they could be of some use to the committee.

Mr. SOUTH: I think I can arrange to have that information for you this afternoon.

The CHAIRMAN: Have you a question, Mr. Muir?

Mr. MUIR (*Lisgar*): Mr. Chairman, evidence was given before the committee that in the opinion of some of the witnesses the cost of distribution, sale and repair of farm implement machinery and parts was unduly high. The federation of agriculture, on page 25 of their submission, said:

It is the belief of the Canadian federation of agriculture that cost of distribution, sale and repair of farm machinery are unduly high. We do not necessarily claim that excessive profits are made by dealers in farm machinery and parts. This may be so in some cases, but we are more inclined to think that the trouble lies in the excessive costs involved under present conditions.

I would like to ask the witness if, in his opinion, the cost of distribution, sale and repair of parts is unduly high in relation to the farm income.

Mr. A. E. CHARETTE (*President, Canadian Federation of Farm Equipment Dealers*): I am sorry, Mr. Chairman, but I cannot tell you just how the federation came to these figures. However, in our appendix, we have some figures of sales on which our dealer margin is 20 per cent; then we bring down on that statement our cost of operation and, when we come down to the net profit, it is 3.7. This is a survey which has been made by one of our employees during the last year in that school about which we were talking. This has been substantiated by Dun & Bradstreet and, it is, in fact, only 3.4. I am sorry, but we are unable to tell you how the federation came to those figures.

Mr. SMALLWOOD: I have a supplementary question, and I have checked up on this. I see you have an over-allowance of 8 per cent, and I presume that concerns trade-ins?

Mr. CHARETTE: Yes.

Mr. SMALLWOOD: Let us consider that you are selling a combine, and the dealer's commission is \$1,000. This would involve a large combine out west and, in this case, you have over-allowed him \$400. Now, under selling expenses, there is the figure 7 per cent, which means an amount of \$350 to sell a machine like that. I think there must be something wrong, if it is going to cost you \$350 to sell a combine of that type.

Mr. CHARETTE: In the selling of this type of combine or this particular type of equipment, there would not only be one call involved. Our selling force constitutes 7 per cent of our selling expenses for the year; it does not apply only to the one combine.

Mr. SMALLWOOD: That still would be high. I have been quite close to the dealers in this connection, and I think you have over-extended that a long way.

Mr. CHARETTE: Well, if you would check in connection with other selling expenses, you would find that their selling expenses in a lot of instances would be over 7 per cent. For instance, take car dealers; their selling expenses are away over that.

Mr. SMALLWOOD: When you have ended up, finally, you have left the dealer only \$150 out of \$1,000, and I do not think that would be correct. If it was, a lot of dealers would be going out of business.

Mr. CHARETTE: There are quite a few that are going out of business for that reason, because they are giving too much allowance or too much of a cash discount. Normally, if the farmer is buying for cash, he will, right off

the bat, tell you, or ask you how much discount he will receive, and when the dealer is in a position to lay his hands on cash, in many instances he is quite willing to give that cash allowance.

Mr. SMALLWOOD: The intimation being that you would be further ahead to give a cash allowance than have a combine on your hands?

Mr. CHARETTE: Yes.

Mr. KORCHINSKI: I have a question along the same lines, Mr. Chairman. I have before me appendix No. 4—Washout record, and your original cost of the tractor was \$2,400. I think this was intended to show that you had two trade-ins in the meantime, and that your profit in the end was \$301. Could you tell me what percentage \$301 would be of the original profit? I think it would be about 12 per cent of the original cost, and, certainly, that suggests to me that there is a fair return, especially after considering that your selling expenses have been discounted already. Now, this is profit about which we are speaking. I think, perhaps, even if you looked at it from another angle, if you included the cost of the trade-ins—for example, you have \$4,058, your cost of all the units, you will end up with a 7 per cent profit. I think that is a pretty fair rate of return. Have you any comment to make on that?

Mr. SHIELDS: I think, sir, this can be taken as gross, and not net.

Mr. KORCHINSKI: It says: "net".

Mr. SHIELDS: That is on those units, but here you have to take into consideration the earlier operation. We are just dealing with these three particular units. On this particular deal he did very well, but on another particular deal it may go directly the opposite way. Any of the gentlemen farmers from western Canada will realize that normally the sale of one combine will necessitate the sale of three combines before the sale of one unit is completed. The farmers in our particular area require these units to be overhauled, priced and serviced under the warranties.

Mr. KORCHINSKI: I understand all that, but this is supposed to represent an average sale. In other words, you can have a better sale and a poorer sale, but you yourself state this is an average sale.

Mr. HORNER (*Acadia*): I should like to refer to the bottom of page 7 of Mr. Sykes' brief, where he states:

At one time, some years ago, all major companies in the United States opened and operated a number of their own stores.

The brief goes on to say on the next page:

The present day practice in Canada appears to be revival of that condition.

This company store idea is rather interesting because it opens up a kind of new line of distribution, and the committee is always concerned about distribution costs. No doubt we shall have briefs presented at a future date which will question the distribution costs of most of the farm machine manufacturers. How would a company store differ from such an operation as C.C.I.L.? They operate purely distribution points on a kind of company basis.

Mr. SYKES: First of all, let me say I believe everyone is seeking desperately for a new method of marketing, and I believe any person who could come up with something entirely different, with a new program, could secure approval immediately. This previous company store operation was started by everyone in the industry and was carried out for a period of three years. Now, coming back to parts of the brief where I have pointed out there is almost as close a relationship between the farm equipment dealer and the farmer as there is between the farmer and his wife, when the company store operation is put into

effect there is a hesitancy on the customer's part, because he regards it as more or less a machine operation. There is no feeling in marketing of that kind.

Mr. HORNER (*Acadia*): I understand that. In other words, a manager is paid to sell a given line of products. He has no interest in whether he sells a greater number of products or a fewer number because the profits he makes are, in a sense, not his. Would not this be comparable to some extent with the C.C.I.L. operations, if you are familiar with them?

Mr. SYKES: To some extent, yes, but because that company store is not showing a good profit it is going to close up. That is not the manager's responsibility, nor has he the personal interests of the community at heart. He is only justified in showing a profit.

Mr. KORCHINSKI: Is the C.C.I.L. a member of your association?

Mr. SMALLWOOD: On page 6 of your brief you say:

Pity the farm equipment dealer who lives within ten miles of his place of business for numerous will be the rappings on his door, on Sunday or at any other time during the day or night that he fails to have his business door open.

In that particular instance, are you boasting or complaining about it?

Mr. SYKES: I hear many of the dealers complaining.

Mr. HICKS: A dealer who complained like that would not make a good member of parliament.

Mr. SMALLWOOD: I do not find too many dealers complaining. There are many instances such as this in your brief, and it seems to me to be a very crying brief on behalf of the dealers. I am sure if I took this brief back home and showed it to some of the farmers and dealers in my area, I do not think they would be quite too happy with it. For instance, you go on to say at page 8:

We see the farmer-customer looking for, in fact, demanding immediate service and he is gleeful if he has a well established dealership next door to his farm operation.

Then, on page 10 you go on to say:

It is not uncommon for the farmer when he fails to have a piece of trade-in equipment himself, or is unable to resurrect one, to seek from his neighbours something that might be used for trading purposes.

I do not agree with you there at all. I have friends back home who are farm machine dealers and the farmers would sooner go to one of them and say: "look, I have nothing to trade in; I will take a cash discount". There are too many instances like this in your brief. I am thinking of what would happen if your association got the dealers to follow that line. If dealers closed down at 6 o'clock at night and on Sundays, what would happen the farmer who has a breakdown on Saturday night, during his busy season, and has to wait until Monday morning to get a spare part?

Mr. CHARETTE: I am sorry to say we have quite a few farmers calling on our dealers after hours, and on Sundays. We are so familiar and intimate with them that we cannot very well refuse service to them. If we do that, they lose faith in us. Of course, after hours we cannot send an employee because he will be at home. He has his family life, so it is the dealer who has to go out and see if he can help or not. If a machine is broken down and you have a replacement in your shop, a spare part may be all that is required. You cannot tell the farmer: "Sorry, brother, you have to come back on Monday". The farmer's work is seasonal and we have to accommodate him as best we can.

Mr. SMALLWOOD: That is one of the points. However, in your brief you speak of these demands by farmers.

Mr. CHARETTE: We do not complain about that. We just say it has to be done.

Mr. SMALLWOOD: But, on page 6 of the brief, you are more or less complaining.

Mr. CHARETTE: If it were a company store the manager would just go home. He would say: "Brother I am paid for 40 hours, and that is all".

Mr. KORCHINSKI: I think there is a difference between providing service after hours, and providing it on Sundays. If you are selling equipment to a farmer that is all right but, if you are servicing his equipment, there is a different attitude.

Mr. CHARETTE: We would be only too happy to call on a farmer when he is not too busy. At such a time we can sit down with him and talk. I am not objecting to servicing after hours, but it is extra expense for us.

Mr. SMALLWOOD: We have a very good Massey-Ferguson dealer in my town. Every night he is there until midnight, and he has increased business by doing that.

Mr. CHARETTE: That would be right.

Mr. HORNER (*Acadia*): I have a supplementary question.

Mr. MONTGOMERY: May I ask one little question? Is there any extra cost for all this service to the farmer?

Mr. CHARETTE: If we have to send a mechanic out to do repairs, then there is extra cost. However, if it is the boss who goes out and is able to do the job there is no extra charge.

Mr. ARGUE: You mean he works for nothing?

Mr. HORNER (*Acadia*): On the top of page 8 you state:

The present day practice in Canada appears to be a revival of that condition.

In what way is this revival of company stores occurring?

Mr. SYKES: As so frequently happens in Canada, some process is experienced to the south of us and, about a year, two or three years later, we have it here. We could refer this to the designing of ladies' clothes. Anyway, it seems to work its way up to us.

Mr. HORNER (*Acadia*): But this is a particular reference to farm machinery. Are the big manufacturing companies such as Massey-Ferguson, John Deere and International Harvester opening up direct company stores in Canada?

Mr. SYKES: From time to time, yes.

Mr. HORNER (*Acadia*): And you feel this company store idea is going to grow in Canada?

Mr. SYKES: It has a tendency.

Mr. ARGUE: I wonder could we get at least a partial list of some of the company stores to which you refer. My knowledge of this business is, naturally, confined to a very small locality. I personally know of none of the big manufacturers who operate their own stores.

Mr. MUIR (*Lisgar*): There are some.

Mr. ARGUE: In the city of Winnipeg it is a dealership arrangement. I should like to know some of the stores, and something about the history of this development.

Mr. DICKSON: I am from Manitoba and I only know of two company operated stores.

Mr. ARGUE: In the whole province?

Mr. DICKSON: Yes.

Mr. ARGUE: Could you tell me the names of the companies?

Mr. DICKSON: J.C.I. has one and Cockshutt has the other.

Mr. ARGUE: Located where?

Mr. DICKSON: J. C. at Glendale and Cockshutt is located at Portage la Prairie.

Mr. ARGUE: Roughly, how many dealers would you say there are in Manitoba?

Mr. DICKSON: We have about 530.

Mr. ARGUE: That answers my question.

Mr. ALLINSON: My knowledge is not large but I do know of two in Ontario operated by Cockshutt, one in the city of Pembroke and one in the city of Brantford.

Mr. ARGUE: And they are operating in the same field as other dealers?

Mr. ALLINSON: Yes.

Mr. SMALLWOOD: Are there any in Alberta, in Saskatchewan?

Mr. SHIELDS: I do not know of any in Alberta.

Mr. DICKSON: I may add that so far as we are concerned we think the companies do not like putting in a company store unless it is absolutely necessary. If they cannot find a dealer then, naturally, they operate a store themselves.

Mr. SOUTHAM: Mr. Chairman, I should like to associate myself with the remarks made by Mr. Horner when opening this discussion, and to congratulate Mr. Sykes and the Canadian federation of farm equipment dealers on their very comprehensive brief. However, in reading it and listening to the discussions here this morning, I should like to associate myself with Mr. Smallwood in his general comments with regard to the tone of the brief. It seems to present the dealers in a grave position, subject to the demands of the farmers on the one hand and to the demands of the manufacturers on the other. These references persist throughout the brief, but we must remember that the dealers have to adapt themselves to the function of moving farm machinery from the manufacturers to the farmers.

Mr. SYKES: I think I should justify myself. I am executive secretary of the association and, of course, my bread and butter comes from my employment with the dealers. I listen to the dealers all the time and I do not think there was any intention of crying in the brief. Our job was to explain the dealer's position, the dealer's life as he lives it, and I am speaking strictly for myself when I refer to the brief in that way. I feel rather badly if I have created the impression that the dealers are weeping about their position. I merely tried to point out what a dealer does to facilitate and carry on the operation in which he is engaged.

Mr. SOUTHAM: I am interested in these discussions that have come up before with other witnesses, and that is to do with servicing operations. The figures quoted in the insert of your brief indicate that an average dealer serves a net loss of six servicing operations. This is supported by the complaint at the top of page 19 of the dealer who is required to service a machine from the sale of which he did not realize any money. There are two points that are evolved in this situation as I feel they exist, and the first is the margin on the sale of new machines is calculated to include an allowance for loss on subsequent servicing. The second observation is that the servicing establishments are too small at the present time to have the volume necessary for profitable operation. That is pretty well outlined in your brief. Have you any suggestions or comments to make on this situation?

Mr. SOUTH: I think that with our requirements in the service shop we have to have so much equipment regardless of whether we have three men or 15 men in the shop. We have to keep these people the year round—they spend the winter months repairing and overhauling trade-in machines and in the peak of the season we have to have maximum capacity. That is probably where the evil in this thing comes in. We get the fellow for twelve months in a year so he can do the job in three or four months.

Mr. SOUTHAM: That helps to clarify it. It seems to me to be an over-all problem, and I am just wondering if that particular factor could be brought to the attention of more dealers, because it seems we are in the transition period now, getting from smaller to larger dealers, and it is quite apparent that this situation exists. I am thinking that it reflects the direct or ultimate cost to the farmer and the price of his machine. I am trying to get an opinion from you people as to what would solve that—you would try to get small village dealers to centralize in the bigger areas to make a bigger operator?

Mr. SOUTH: I live in a very small hamlet—one of the smallest—and we have a comparatively large business. I do not think the location is what we need to consider here. It is where we are located in relation to our customers that matters, regardless of whether it is a big or small location. I think that the evil in this service business has been brought up by the dealers themselves because we have a lot of dealers, competition is great, there is also the matter of free service. It is just as big a matter of competition, that I may not sell a tractor for \$100 less than my competitor, but if the customer thinks he can get better service from me, I will get the business. I still think that most of that evil has been brought on by the dealers themselves.

Mr. MUIR (*Lisgar*): Can I ask another question? I have a supplementary question with regard to the trade-in. I notice at the end of page 1 and the start of page 2 you talk about stabilizing the price of the machines, and you send out a guide which the dealers call a trade-in guide. How do you arrive at these so-called stabilized or suggested prices? In my experience, one farmer will use a machine for ten years and it will be in very good shape when he trades it in; another comparable machine may be completely worn out. How can you give the dealer any guide as to what price he should pay on his trade-in machine?

Mr. CHARETTE: Mr. Chairman, the price in this guide is the price of the machine when it is ready for resale. It means that when we take in a tractor we use this price and then any repair that has to be done on the machine is deducted from that price. This is what we might say is a normal selling price. We take the machine when we do not have to spend more on it than we anticipated to repair it.

Mr. FORBES: I have a supplementary question on the same thing. I take it, then, from the expression of opinion on the price of machinery, that machine agents have to have two-price systems: one for cash, and one if you have a trade-in. As long as you fellows have a two-price system on machinery, you cannot blame the farmer for adopting a Scotch attitude when he gets to the dealer. You have a stabilized price on your equipment.

Mr. SYKES: Let us use this again for a moment. First of all there is no hard and fast rule nor does the dealer use it as such; it is strictly to assist and guide him. As our brief says, the dealer never realizes the suggested list price. He is buffeted by so many things. It would be a wonderful thing and the dealers would welcome the stabilization or the setting of a hard and fast rule. There is non. The dealer must depend on his own judgment and ability.

Coming back to the other gentleman's question about the different types of machine, one machine might be a tremendous trade-in value after ten years' use, and the other is of no use. The dealer relies on himself and himself alone

on the price. One of the things—if we are doing any crying at all, and I say we are not really—the whole problem is that we can go to five different dealers in an area and have five different prices, not that the dealer wants it that way but he is buffeted around by all these conditions. I agree that the Scottish attitude of the farmer is quite all right, but it makes it awfully difficult for the dealers. I am very anxious to make it known that no one ever sticks to this book. We provide it to assist in stabilizing prices and we hope eventually dealers will use it as a guide, and I know many of them do so. They turn it up, take the serial number and use the guide to see if they have offered anywhere within a reasonable price for that particular item.

Mr. REGNIER: What happens when the dealer gets more for the machine than he paid to the farmer for it?

Mr. LEVESQUE (*Interpretation*): It compares with the losses you can make in other directions. For instance, this can compensate for a 50 per cent gap in another respect. In other words, this type of profit will compensate for losses. In fact, you can come and see for yourself.

Mr. HOWE: We were talking about resale prices. The suggestion is made in this that 20 per cent is indicated as the medium through which you arrive at the suggested resale price of a machine. Does that 20 per cent hold true for all prices in the machinery section—a machine that sells for \$500, does it have the same marginal profit as a machine that sells for \$5,000, in arriving at the resale prices?

Mr. CHARETTE: Yes, it does. Most of these companies give a suggested resale price and our invoice will be this resale price, less 20 per cent. It does not matter which machine they have, it is 20 per cent. That is a gross discount, you might say.

Mr. HOWE: That is 20 per cent on the selling price, or 20 per cent on the cost?

Mr. CHARETTE: On the suggested selling price.

Mr. HOWE: There is no differentiation between a machine which costs \$500 and one which costs \$5,000? I have heard that in the car business the cars that will sell for \$3,000 carry one percentage of profit and those that sell for \$7,000 or \$8,000 carry a bigger margin.

Mr. CHARETTE: Not that I know of.

Mr. ALLINSON: I would say you often get less.

Mr. HORNER (*Acadia*): Would that hold good for some of the smaller items, such as grain augers, picklers, and so on?

Mr. SOUTHAM: I would assume that in the overall picture of disposing of all types of farm implements you would presumably have grain augers, small stationary engines or picklers, which you might have had a long time in stock, and the loss in getting rid of such stock is compensated by the overall selling picture from the big machinery. As Mr. Howe has pointed out, a machine selling for \$5,000, where there is a 20 per cent mark up, has a large amount of money involved, that would compensate in some respect in the overall picture, rather than taking the individual prices.

Mr. LEVESQUE: When you are dealing with 20 per cent, you are actually dealing with an exact figure of 20 per cent. You have to add to it the expense of freight from the manufacturer, transfer to the depot and from the depot to the dealer. In other words, when these expenses are figured, the actual markup is far from being 20 per cent.

Mr. KORCHINSKI: Does this also apply to the parts that you get? You have 20 per cent for big units. There is 27 per cent original discount on parts, is there not?

Mr. CHARETTE: Yes, that is right.

Mr. KORCHINSKI: Why would you say that you base it on 27 per cent?

Mr. CHARETTE: It is an average overall cost of about 27 per cent. I would not say it is exactly 27 per cent on all parts, but it is an average overall cost of 27 per cent on parts.

Mr. KORCHINSKI: You also include here in this information that you have an extra discount of 5 per cent on parts. Would you explain that?

Mr. CHARETTE: This is not a quantity discount. If you do \$40,000 worth of business a year, you get 1 per cent; if you do \$75,000 worth of business in the year, you get 2 per cent. There is a graduation up to a limit of 4 or 5 per cent.

Mr. KORCHINSKI: Five in the case of parts for new machinery. Would you say that the discount is because not only are your sales not so great, but also you may be stuck with some of these parts in some way? In your brief on page 13 you state:

Most companies permit the dealer to return unsold parts, 6 per cent net (dollar value) of the previous year's total purchases. . .

—and so on. Is this the worst case or the best case that you can provide? I am asking that because when Massey-Ferguson Limited presented their brief they said under the parts return program:

Under the parts repurchase program the dealer may return to the company, once a year, for full credit, a given amount of parts based on his past year's purchases.

I think they said at the time that it was 20 per cent of the purchases over a period of years. You say you have only 6 per cent net of the previous year's purchase on which the dealer will be reimbursed on a basis of 50 per cent. I want to know if this is the worst case, the best case or an average case, or if some companies do not give you that type of a dealer arrangement?

Mr. SOUTH: The figure quoted there of 6 per cent of last year's sales means that if I bought, say, \$10,000 worth of parts from Massey-Ferguson last year they allow me to return 6 per cent of that \$10,000 worth, which is \$600 worth this year at 50 per cent discount. These are parts which are in the current price list. If these parts are not in the current price list, we put them in the wheelbarrow and run them out the back yard. These figures are authentic and I can give these figures this afternoon.

Mr. KORCHINSKI: There seems to be some conflict and that is why I raised this. They said:

Under the parts repurchase program, the dealer may return to the company, once a year, for full credit, a given amount of parts based on his past year's purchases.

They said 20 per cent of a given amount. The given amount, I think, was 20 per cent, that is for full credit, and you say for half credit.

Mr. SOUTH: We are talking about obsolete parts here.

Mr. PETERS: No, no.

Mr. SOUTH: If you order a part for your combine and if you are given a wrong part or a wrong number, and if you send it back within 30 days and it is listed o.k., it will be sent back for full credit. But these things happen very seldom. If a man is doing his job, it does not happen. What we are concerned about here is the backlog of parts. If you take a number four Massey binder built in 1895 and if you have parts for that, those parts go out the back door. There is no return provided for.

Mr. KORCHINSKI: I am not arguing that, but I would like some clarification on this. They state here "once a year". It does not refer to a 30-day arrangement at all. It is once a year they allow you to send back a given amount of parts for full credit.

Mr. SOUTH: These figures I have given are authentic and I would be glad to back them up.

Mr. KORCHINSKI: I am bringing this up because there appears to be a conflict.

Mr. PETERS: Are you a Massey-Ferguson dealer?

Mr. LEVESQUE (*interpretation*): There was one question which was not mentioned. There are certain items which we call manufacturers or factory items which must be ordered direct from the factory, and which are not held at the depot, but are ordered for one customer, and one customer only. If we do not sell such a part, it cannot be returned to the factory. It becomes a total loss.

Now, as far as obsolete parts are concerned, there are certain other parts which are obsolete in that they do not appear on the manufacturer's list price. We carry them, but since they no longer appear on the manufacturer's list price, they cannot be returned, and no credit at all is given for them. As far as I am personally concerned, I feel that they can make up to ten per cent of our total inventory.

Mr. KORCHINSKI: How can the manufacturer tell whether such a part was ordered specifically for one farmer, or if the dealer wanted it to have on his shelf, because he expected to sell it?

Mr. LEVESQUE: The dealer has nothing to do with it. We are ordering for a customer who wants to buy it.

Mr. KORCHINSKI: Was not the suggestion made that a refund for the particular part, under certain circumstances, should be made?

Mr. LEVESQUE: Usually, it is because the machine is not manufactured or made by the company.

Mr. PETERS: This is not a regular supply part which comes out of stock. It is considered from the manufacturer's point of view not to be out of his stock?

Mr. LEVESQUE: They have no record of sales for it, and we are the only ones who asked for it.

Mr. KORCHINSKI: I would not expect any dealer to stock, let us say, transmission parts for a tractor, because they very, very rarely break down. So I would not expect a dealer to stock them. But if you should stock such a part, would it be returnable?

Mr. LEVESQUE: Yes, at 50 per cent sometimes.

Mr. THOMAS: Mr. Chairman, on page one, of their brief, the Canadian federation of farm equipment dealers deal with the purposes of the association and their relationship to the large manufacturing company. There are three sentences in the paragraph immediately after the obligations, which I would like to have amplified. They say:

One of the prime purposes at the time of organization was that some type of licensing of farm equipment dealers be made effective by and through the association.

That is mentioned later on. I would like to ask if any progress has been made in this regard.

Mr. SYKES: Not as far as the association is concerned, sir.

Mr. THOMAS: And the second one:

It was further intended that anyone proposing to become a farm equipment dealer must submit to examination by the association.

Is this in effect at the present time?

Mr. SYKES: No.

Mr. THOMAS: And the third sentence reads as follows:

These conditions made for the association a most difficult road ahead for the manufacturers strongly objected to the program of licensing and examination and withheld at that time and down through the years their tolerance of the organization.

Now, the question there, is this: do the large companies object to their dealers belonging to your association?

Mr. SYKES: No, but they are not entirely happy with it. The feeling of some of them from the beginning, is the thought that the association might become too strong and dictatorial.

We enjoy fairly nice relationships with the majority, as I stated, of the manufacturing people. I think we could all benefit if we had a better understanding. I think it varies throughout the industry. I think from some sources we get merely lip service

Mr. THOMAS: Among the definitions listed in the following paragraph you mentioned their representation at Ottawa in connection with the importation of farm equipment. Could you outline what those representations were?

Mr. SYKES: In the early stages, they were hoping to have the conditions that we have today, of passing equipment back and forth across the United States border without duty. That was before my time. But during my time we find the condition existing whereby you can bring a tractor into Canada without any duty, and if it already has a power take-off unit on it, that unit comes in free of duty. But at a later time should you want to bring in a power take-off unit for that tractor, it will be dutiable.

About five years ago we did in fact ask that the duty be taken off those parts, and it was.

Mr. THOMAS: Did your association make any representations with regard to the importation of used farm equipment?

Mr. SYKES: I have been here in Ottawa four times altogether asking that something be done about this condition of the flow of used equipment coming from the United States auction sales, that we referred to this morning.

Mr. THOMAS: You mean to prevent the importation of used equipment?

Mr. SYKES: Yes, that is right.

Mr. PASCOE: Mr. Chairman, I would like to ask Mr. Sykes a supplementary question following up the discussion of the operations of the Canadian federation of farm equipment dealers.

At the start of this hearing, some representatives from other provinces were introduced, but I did not hear of anybody from Saskatchewan. Would that indicate that this association is not too active in Saskatchewan?

Mr. SYKES: The opening of our brief states that we were all together at the beginning, but that about three years ago the Saskatchewan association felt that they might benefit more by affiliation with the United States national association. So today they are affiliates of that group.

Mr. PASCOE: And they are not affiliated with your association?

Mr. SYKES: No.

The CHAIRMAN: We have received a letter from the Saskatchewan association asking if they might come and present a brief before the committee. The subcommittee will deal with that later.

Mr. HORNER (*Acadia*): That is from the Saskatchewan association?

The CHAIRMAN: Yes.

Mr. KORCHINSKI: I have a supplementary question. On page one of your brief you stated that:

One of the prime purposes at the time of organization was that some type of licensing of farm equipment dealers be made effective by and through the association.

And on page 22 you say:

This suggestion that a form of licensing might be helpful does not particularly appeal, once again, to the free enterprise merchant.

You suggested you were not quite satisfied with the overall results. Would you suggest that perhaps the fact that Saskatchewan did not belong to your organization is one of the things which is causing a little trouble in your organization?

Mr. SYKES: No.

Mr. KORCHINSKI: They are in no way associated with you?

Mr. SYKES: No.

Mr. KORCHINSKI: Would you like to have them? Have they been in previously?

Mr. SYKES: They have been, yes. They were until they affiliated with the U.S. National. We all considered affiliating with the U.S. National because it is bigger and older; but the terms of affiliation did not appeal to us.

Mr. KORCHINSKI: Are you familiar with the licensing in Saskatchewan?

Mr. CHARETTE: Alberta has a licensing operation and Mr. Shields might reply.

Mr. SHIELDS: I have started to look into the Saskatchewan situation. It is handled by a machinery board which they have, of which Mr. King is a member. From what I have been able to determine so far, they are adopting a situation whereby they have A, B and C type dealers, depending on the type of contract. These dealers would carry so many dollars worth of parts. The area in which they are situated becomes theirs, so that another dealer from the same company does not get set up in that area.

In Alberta we are licensed under the provincial licensing act and all our mechanics are licensed under the trades act. Therefore, we are licensed operators and are confined to farm equipment. We cannot handle or service cars. Some people, however, have a dual licence. That is the provincial control they have in the province of Alberta.

Mr. HENDERSON: I would like to dispel the poor-relation aspect in respect of the implement dealer. I come from the Peace river area. I would like to give you the names of a few people who made money in the implement business. J. D. McEarchen is very rich; Mel Rodacker of Grand Prairie is an Alberta man in good circumstances; Ralph Tompson made a quarter of a million dollars; McKinnon is the big Case dealer at Dawson Creek and is one of the biggest dealers in western Canada; and Aspal made a fortune and sold out. There you have it.

Mr. HICKS: I would like to turn back to page 6, the third paragraph, where you were talking about equipment repairmen as doctors always on call. It says:

All of these exacting demands must be performed by the dealer-owner-manager-salesman-serviceman and jack-of-all-trades for he, many times, because of provincial labour laws is not allowed to delegate after hour work to employees.

Is that actually true? If a farmer has a combine which breaks down at dark do you mean that a company employee is not allowed to come out and repair that so that it can go ahead tomorrow and save the farmer dollars worth of grain?

Mr. SYKES: The situation is this. If a dealer is to work his employees beyond the required labour hours he must have a permit for overtime operation. There is a considerable leniency, I admit; but I do know of a situation in Ontario where if you want to keep your staff beyond the normal working time you have to get an overtime permit. This is not applied in all instances. We escape it. We are given consideration; but I make mention to it here because I feel it could well apply to every one of the farm equipment dealers and would be unfortunate.

Mr. HICKS: We used to wire up our machinery until dark, so that we could fix it during dark.

Mr. SHIELDS: In the province of Alberta they have what is known as the labour relations board. They make a check of our time books twice or three times a year. If the men work past a certain hour of the day they raise Cain.

Mr. ARGUE: Even if you pay them time and a half?

Mr. SHIELDS: Yes. They still do not like it.

Mr. ARGUE: They do not prevent it; there is no law.

Mr. SHIELDS: No; except on Sunday.

Mr. ARGUE: That is a federal act which applies to everybody.

Mr. SHIELDS: But there is the proposition we are speaking of, of trying to keep the costs down. We are faced with a problem which sometimes we cannot pass on.

Mr. HICKS: Could they not take time off the next morning.

Mr. SHIELDS: No.

Mr. ARGUE: You are not prevented from it by law. The law states that the employee must be paid time and a half.

Mr. SHIELDS: The employee himself has reached the point where he wants that particular time for his own family.

Mr. ARGUE: That is his own right; that is not a law.

Mr. SHIELDS: No.

Mr. ARGUE: I do not think that is a valid point.

Mr. PETERS: If, for instance, you make this complicated sale of which we have an example here, then what is the advantage of selling a piece of machinery to a farmer? What is the actual benefit to a dealer in selling this, not in terms of the \$301 you get for the final transaction, but say that one buys a tractor from a dealer at \$3,000, how much would he expect to make out of that tractor before the buyer gets rid of it in ten years time? In other words, why do you want him to take your tractor instead of somebody else's tractor?

Mr. SMALLWOOD: To sell repairs.

Mr. ARGUE: They say they make nothing on repairs.

Mr. PETERS: Why do you want him to have your tractor instead of somebody else's tractor?

Mr. CHARETTE: For the simple reason that if we cannot sell our tractors, we won't be in business.

Mr. PETERS: Well, if you do not make any money, there is no point in selling it. Do you count on 10 or 15 per cent over the lifetime of that tractor, in services?

Mr. SOUTH: I would refer you to part of the appendix. There is a misunderstanding about that \$300. That is a net profit on that particular transaction. After you take the net profit on that particular transaction, you take your operating expense off your over-all business and deduct from that, and we have a net profit of our volume sales for the year of 3 per cent. We live on that 3 per cent. That is the reason we want to sell the tractor. We will have a net \$60 on that tractor for ourselves.

Mr. PETERS: I say that you would not be in that business if you only made \$60 on a \$3,000 unit.

Mr. SOUTH: Well, that next statement will prove it.

Mr. PETERS: I do not believe it. 3 per cent would not allow you to operate. If I am selling cars and say, for example, I sell a Ford car, I expect that after I sell it I will have the buyer come back for an oil change once a month; he probably will obtain 20 tires for that car during its lifetime and, if I am a good guy and he likes my dealership, he will come back and get a car wash. In this way, over a period of years, I am going to make three times as much profit on service as I would on the selling price. Is this not true in the case of farm equipment? Does the service not amount to more than the selling price?

Mr. SOUTH: Yes, but you cannot very well compare automotive with farm equipment. If you have an automobile and there is something wrong with it, you take it into the garage; they plug in the time clock and charge you \$4 or \$5 an hour. However, if a manure spreader breaks down, you have to go out to the farm and fix it in the yard.

Mr. PETERS: But there is a fee of \$4 or \$5 for going out to fix it.

Mr. SOUTH: If it is under warranty, you do not charge; the dealer has to pay that. The company does not pay under the first year of the warranty.

Mr. KORCHINSKI: But, you get compensated for the labour.

Mr. SOUTH: On balers, tractors and combines, we do, but not in the case of a manure spreader.

Mr. SMALLWOOD: In regard to tractors, is it not a fact that you want to get them out into the country so that you can sell repairs for them?

Mr. SOUTH: I think I can prove to you that we are not making any money on repairs.

Mr. SMALLWOOD: Oh, dear me.

Mr. SOUTH: 25 per cent profit on a \$10,000 volume, which is a fairly high average, gets you \$2,500, which requires a full-time parts man.

Mr. SMALLWOOD: We have lots of dealers out there who do not have any full-time parts men.

Mr. ARGUE: Cannot your parts man do something else when he is not selling parts? Is it against the law if he does? Or, does he sit on a stool all day and wait for somebody to come in? Could he not go out and sell some gas, if there are pumps in front of the premises, or could he not take a wrench in his hand, or is that against the law?

Mr. SOUTH: Well, anyone that is doing \$10,000 or more of parts business has a full-time parts man and, by the time he keeps records of 10 or 15 years back of every sale, and his other duties, in order to get away from this obsolescence about which we have been talking, he has not time for anything else.

Mr. KORCHINSKI: Well, to put it another way, there are two types of dealerships; one being a bigger operation, which requires a parts man, and another, where it is a dealer-owner setup, and he fills in as parts man. When he is an owner, and acts as a parts man himself, he is making wages and, in that

case, it might be more profitable for him to sell less and do without a parts man. In this case, the dealer does not make anything on the parts he sells, because the parts man gets all the wages.

Mr. SOUTH: I agree with you. In our first year in business we made a better profit than when we had 15 men employed. We have to see that the parts man gets his wages first; then, there is the overhead and the obsolescence to be taken into consideration. After this is done, if we then make a profit, it is ours. However, everyone else gets his first.

Mr. KORCHINSKI: Could you supply us with a breakdown to illustrate how many dealers you have in that category which hires more than five men in their business, as compared with a man who does all the work himself but who might have a mechanic or someone else who does part-time work—such as making deliveries to the customers, and so on. In other words, could we have a breakdown showing the size of the different dealers.

The CHAIRMAN: Mr. Forbes has a question.

Mr. FORBES: Does the manufacturer exercise any control over the price of parts and repairs?

Mr. SYKES: No.

Mr. FORBES: I often have thought that when I go in to buy repairs, there is no control on the price.

Mr. LEVESQUE (*interpretation*): I was glad to hear the remarks made by the gentleman who comes from the Peace River area, and I am quite happy to know there are some good dealers in that area. In fact, on second thought, I think I should like to go there myself. However, I think it will be admitted there are big and small dealers, good and bad dealers, but I should like to point out that in the province of Quebec, from which I come, I have an operation which continues from May to December—May, June, July, August and September. At all times we have over 15 employees. We have to have seven mechanics, three servicemen and a number of office workers, and it is desirable for us to maintain all of these people even though our activities are only for a few months of the year. We have to keep our workers for the full twelve months of the year. During that time some of them may leave us, some go on holidays, but we have to keep staffed at all times.

I believe this is also true of the Maritimes and even Ontario. Therefore, we have of necessity to add other lines to our general service, so that when we pay our taxes there are included our general costs. Our general costs are considerable and they incorporate a great many things, so that the profit figure is far from being as impressive as might appear.

Mr. HENDERSON: I still say we have dealers who made a pile of money in the Peace River country.

Mr. ARGUE: In my country they all went broke.

Mr. HENDERSON: Harper was here only a couple of days ago, on a trip around the world. There was also Tompson, and I could mention many others around Beaverlodge and all over that country. I do not think the dealer has a chance to cry, if he does any kind of business. I am a farmer and have been one all my life. I have lived there for 42 years and I know that a dealer, if something breaks down at ten o'clock at night or two o'clock in the afternoon, comes along and fixes it.

McKinnon is one of the biggest dealers. Possibly this gentleman knows him.

Mr. DICKSON: I must say the advertising you give the Peace River area may attract all the dealers from all the other provinces.

Mr. HENDERSON: I just received a letter this morning from a group of French Canadians who want to come to the Peace River area.

Mr. DICKSON: I should like to answer this gentleman from Peace River. I come from Manitoba—

Mr. HENDERSON: I was born in Manitoba.

Mr. DICKSON: In answer to the question about these millionaire dealers, I should like to say I have been in this business since 1930. That is 31 years and, outside of the war years which were all good for implement dealers, from 1930 to 1940 and from 1950 to the present time, we have been depending on franchise contracts to keep living. Without a franchise contract I would be damned poor, I can tell you. I happen to be a blacksmith and in that business can do a very good welding job.

Mr. HENDERSON: What town?

Mr. DICKSON: In Brookdale.

Mr. HENDERSON: I was born in Carberry, right next to Brookdale. It is not to compare with the Peace River country.

Mr. ARGUE: They are not as wealthy there as in the Peace River country. How many dealers are there in Manitoba?

Mr. DICKSON: We have approximately 530 dealers today.

Mr. HENDERSON: Too many dealers.

Mr. DICKSON: The farmer wants more than that. He wants plenty of dealers when he wants to get a welding job done but, when he wants to buy a combine he does not come to Brookdale. He may even go over to Carberry. Ten years ago we had something like 1,600 dealers in Manitoba and today that figure is down to 530. If this were such a good business why have they not stayed in it?

Mr. HENDERSON: They were in the wrong place.

Mr. DICKSON: If someone wants to sell out in Manitoba today, he cannot find anyone to buy his business.

Mr. HENDERSON: I was in the Brookdale country selling broncos. I know the country like the back of my hand. I was there when the sand was blowing up against the fences at Mackenzieville. That country is not to be mentioned in the same breath as Peace River. On five occasions we had the champion grower of wheat, the champion of the world, in the Peace River country. You have got to come and see it.

The CHAIRMAN: Gentlemen, now that we have learned where to go, maybe this would be a good time to adjourn and meet back here at 3.30 this afternoon.

Mr. MONTGOMERY: Could I ask this question? Might the witnesses furnish some information this afternoon? Could you furnish the committee with a list of the number of dealers that have folded up in the last 10 years?

The CHAIRMAN: I am informed that our witnesses have not got that information with them. The meeting is adjourned.

AFTERNOON SITTING

MONDAY, May 8, 1961.

The CHAIRMAN: Gentlemen, we have a quorum this afternoon. Mr. Pascoe has a question.

Mr. PASCOE: I would like to return to the discussion we had this morning on the financing of farm machinery purchases. I was very surprised at the statement that 75 per cent of these purchases of farm machinery are financed through the implement companies, or through finance companies. I would like to follow up Mr. Korchinski's question this morning to see if we cannot

get a little closer to an explanation as to why three-quarters of the farmers finance their implement purchases by means other than through the Farm Improvement Loans Act.

I have here a 1960 report of the Farm Improvement Loans Act issued by the Department of Finance. It states that in 1960 there were 52,811 individual loans for the purchases of farm implements, costing \$79,942,352.

The report also states that loans for the purchase of farm implements accounted for 78.4 per cent of the total amount borrowed under the act. This would indicate that farmers are using these loans for the purchase of machinery.

The report also states:

In 1960 there were 28,774 borrowers who had not previously obtained farm improvement loans. These accounted for 42 per cent of the total number of loans made.

Could this be taken to indicate that there are still many farmers who do not know about F.I.L.A. and the 5 per cent interest limit set by the government? Would you say that a dealer in the ordinary transaction of a sale would ask the farmer if he wished to finance through F.I.L.A. and thus save on his interest payment?

Mr. SOUTH: It is up to the dealer. It is to the dealer's own good to have him use F.I.L.A. I should qualify that 75 per cent guess there. A lot of customers come in with cash who may or may not have borrowed that directly from the bank before coming to us. If they have cash, we do not ask them about it. If they purchase through F.I.L.A. they eventually get a receipt for that purchase. They may ask for a receipt showing the serial number of the tractor, but even then we would not know—they may want it for income tax purposes. In our own finance we carried \$50,000 of credit ourselves in ordinary bank notes. Certainly there is no way of tying it down. As regards the people you are asking about using finance, for the most part they do not qualify, because they do not qualify for F.I.L.

Mr. SOUTHAM: From your observation, would you say that most farmers know about this?

Mr. SOUTH: Oh yes.

Mr. KORCHINSKI: Would it be possible that a banker sometimes has declined loans because he is concerned as to how these farmers may repay and because of the farmer's previous experience he is reluctant to go back again, whereas he can take the path of least resistance through other methods. All he has to do is sign a form and make a payment next fall and one in each of two or three years from that, each October 1st; it is really quite simple by doing it through the machine companies' financial arrangements. Here is another point which has been brought to my attention, that is, some of the bankers for one reason or another ask for titles. That is a point which should be followed up. Also, some bankers will hum and haw before they will give a loan. Is that possibly a factor in deciding whether these loans are paid through F.I.L. or through the finance company?

Mr. SOUTH: That is a very important factor. When F.I.L. first came into being, many of the individual bank managers thought there was too much red tape about it and they did not bother, but discouraged it. We had pretty nearly to insist on it as it is the best way for dealers through the F.I.L. finance. It is better to have 4 or 5 per cent that way, and also the farmer then has more money to spend on machinery.

Mr. KORCHINSKI: Are you aware of any other cases where bankers have asked for titles to land?

Mr. SOUTH: Oh, yes.

Mr. KORCHINSKI: In fairness, I should say that they try to determine whether he is a farmer or a renter, and so on, if they are not familiar with the man. Do you know of cases like that?

Mr. SOUTH: Yes.

Mr. SHIELDS: Our experience in regard to some of the loans that the farmers decided upon has been this. In the past few years we have found that the insurance clause carried by companies' insurance in some of these other cases interested some of the farmers who were not able to get insurance, due to their health. Some of them were using it for that purpose so that in the eventuality of anything happening to them, the yield would not have to be paid out to the bank by their life estate. That shows a clear title, and they are using insurance for that purpose.

Mr. KORCHINSKI: Could you say what rate a man should have to pay to obtain this kind of life insurance?

Mr. SHIELDS: I have not got a breakdown of that. It is included in the over-all policy. They do not break it down either. The farmer does not have an option, he has to take it as it is.

Mr. SOUTHAM: With reference to the statement on page 3 of the brief on the question of the adequacy of finance and stating the farmers desire to retain the farm improvement loan privileges for the purchase of livestock, and so on in this connection I have here a table prepared by the Department of Agriculture in answer to this. It gives a breakdown over the past 15 years.

I think it would be well to have it read in the record. This is from the economics division, Department of Agriculture, and is as follows:

*Summary of Farm Improvements Loans Act—
Loans Classified by Purposes*

	1960	1959	Total 1945-60
	(Millions of Dollars)		
Agricultural			
Implements	79.9 (79.1%)	77.0 (78.5%)	867.1 (85.5%)
Building Construction			
and Repairs	10.1	11.2	75.2
Livestock	9.6	8.0	51.4
Improvement and De-			
velopment works..	1.3	1.4	14.5
Irrigation3	.3	1.0
Electrical Equipment	.4	.4	3.5
Fencing and			
Drainage2	.1	1.1
Total	101.9	98.4	1,013.8

This would indicate a slight decline in the use of the money for agricultural instruments in the last two years, but it still leaves almost 80 per cent. Your brief puts the benefit of farm improvement loans in a bad light. Yet according to this summary, the bigger part of the money is available and is spent for the purchase of farm implements.

Mr. SYKES: I think the brief is based on the story told to the farm equipment dealer. Perhaps the farmer does not want to tell the actual reason.

Coming back to the discussion of a few moments ago, it has been necessary for me, on behalf of the dealers association, to go to banks, because we have found farmers very reluctant frequently to make many farm improvement loans through the bankers.

Two situations exist. The banker sometimes is a chap who came out from the city and who does not know exactly what the farmer needs by way of farm machinery. He will try to persuade him not to buy the equipment.

But the sore point of the difficulty, and the second step is that the bank manager will retract the sale in order for the dealer to make an application for a farm improvement loan.

In such a case he must get a receipt from the dealer showing the transaction. This will set it out so that he is buying so much of new equipment, and is being allowed so much for trade-in, and so on.

Now, he goes over to his own bank manager—or sometimes to the dealer's bank manager. Now, if he goes to his own bank manager, perhaps he is a dealer who is in another line; and I suggest that his dealer might need a covering over-draft. He will tell the customer that he should come back in about two days time when he will then let him know the result, whether he can have this or not. I am referring to his application.

When the customer leaves his office, he will take up the telephone and call the dealer who has an account with him, and he will say: "so and so is going to buy a tractor from so and so. He is allowing \$500 for a trade-in. If you can better that deal, why don't you get out there and try and better it?"

We have found that frequently across Canada. I have visited the head offices of banks to discuss that problem.

Mr. SOUTHAM: That is very interesting. Would you suggest that under the present legislation we should step up the amount of money under the Farm Improvement Loans Act as far as the overall agricultural picture is concerned?

Mr. SYKES: Yes, I think it would be quite helpful.

Mr. SOUTHAM: It is in the process of being stepped up now.

Mr. SYKES: That is very good.

Mr. HORNER (*Acadia*): Would not the fact that in a small town there are five—and in Saskatchewan six—dealers selling machinery and in the same way selling finance, would this not have a tendency to create pretty stiff competition, let us say, between the banks lending the money? Would there not be a tendency to increase sales through finance, rather than banks? In other words, the more delay, the more credit.

Mr. SOUTHAM: We have had evidence that some of the subsidiary companies are getting up to 11 per cent, whereas the farm improvement loan is much lower. I think this is where the emphasis should be placed, and as I said a moment ago, I felt that a number of these small towns might find it pretty tough going.

Mr. KORCHINSKI: I have a question supplementary to Mr. Sykes, about the bankers' policy. Would you have any evidence about kick-backs in cases like that?

Mr. CHARETTE: To answer your question, as far as the dealer is concerned, it is to his advantage to see that the customer gets his money from the bank. We have no kick-back. When we sell a piece of equipment, if the customer borrows money from a bank, then the bank and the government are responsible, if the customer does not pay up.

If it goes through our own company finance—as is the case with most of them—at least we have a guarantee for that company. If the customer does not pay that note at the due time, the dealer has to go over and pick up the machine and bring it over to his lot, and make out a cheque for the amount owing on that machine and give it to us, whereupon it is his.

Mr. HORNER (*Acadia*): Have the dealers noticed at any time that the machine companies are continually writing to them to sell machines through their company finance? Are the dealers aware of this?

Mr. ALLINSON: I can say that the companies I represent have never asked them to finance.

Mr. SHIELDS: There is no pressure on us to finance. The credit manager trusts us, and at any stage he can say, in that respect, that we are not to have any more with respect to a particular farmer.

They will decide on their own form of financing, as to whether they will go to the bank, or will want the dealer to finance it.

Mr. KORCHINSKI: Have you any evidence to prove or to disprove the fact that in areas where you have competitive banks, farm loans under the Farm Improvement Loans Act are higher or lower? I would suppose that if there was competition, it would be easier to obtain a loan.

In areas where there is only one bank, the banker might be reluctant to grant a loan. But in areas where there are more than one bank, the bankers are looking for business in that case. Would you have evidence to support that?

Mr. SYKES: I have no evidence.

Mr. ALLINSON: I could answer that. In Kingston we have plenty of banks. The government and our banks, I am sure, have never turned down a loan or an application for a farm improvement loan where the applicant was in a position to qualify. On the other hand, in a couple of small towns outside Kingston, where there is only one bank, upon occasion I have taken an applicant after he has been discouraged, to my own bank, and got him a farm improvement loan.

Mr. HORNER (*Acadia*): I have another question. On page ten of your brief you talk about trade-ins, and the number taken in. I wonder if you could give the committee any idea as to the percentage of deals now in which a trade-in is involved as compared to deals five years and possibly ten years ago?

Mr. CHARETTE: It is pretty hard to give you a percentage of what the deals were five years ago as compared to now. But we do seem to get more trade-in now than we used to get before, because right now we very seldom—I mean as far as tractors are concerned, for instance, because every farmer has a tractor today. But maybe if it is a new machine such as the combine, or something that is newer, we have a smaller chance of getting a trade-in. But if it is a tractor or a machine which has been in existence, like a manure spreader or something like that, we would have a trade-in in perhaps eighty-five per cent of the cases. Sometimes that trade-in is dragged in on another trade-in on this second-hand machine.

Mr. HORNER (*Acadia*): What would you say the situation was five or ten years ago? This might give the committee some idea how this trade-in enters into the profit ratio picture, particularly the dealers' profit ratio. I think the committee should be aware whether it has increased or decreased. You say eighty-five per cent today. Would you hazard a guess as to what it was five years ago? Would it have been perhaps eighty per cent?

Mr. CHARETTE: I will ask some of the older dealers to answer that.

Mr. SHIELDS: I am not such an old dealer. I have been in this business since 1948. In 1960 of all the deals we made there was only one in which there was not a trade-in involved. Going back five years I would say we might have made five or six deals in that period in which there was no trade-in.

Mr. HORNER (*Acadia*): Can you take your memory back ten years?

Mr. SHIELDS: I would say in that period if you sold ten combines you might sell five without a trade-in, right after the war.

Mr. HORNER (*Acadia*): I was thinking about 1950.

Mr. SHIELDS: 1950 was a trade-in year.

Mr. HORNER (*Acadia*): You were taking in a lot of trade-ins in 1950?

Mr. SHIELDS: 1950 and 1951 was the start of the heavy trade-ins.

Mr. HORNER (*Acadia*): From 1950 what has been the picture?

Mr. SHIELDS: If you sell ten tractors in a season you would have to sell forty tractors to be clear. It is usually ten trade-ins before you are clear. This has been fairly evident all through the fifties; it gradually built up.

Mr. HALES: We are here to get down to the consideration of farm machinery. As I travel through my riding I find it is a very important subject with farmers. So far this afternoon I do not think we are making much headway. We are not getting down to basic facts. So far as the machinery is concerned, I am satisfied there is enough competition between machine companies so that the law of supply and demand will take care of the prices of those. When it comes to parts I feel that we lack competition in the manufacture. I would think that this is the case. If a man has a Cockshutt or International machine he goes for a part. There is only one part that will fit his machine. There is no substitute. There is the part; he has to have it. There is the price; he either takes it or goes without it. I think here we get at the problem. There it is; there is the price; there is no alternative. If there was competition in parts there would be a lower price for parts. I do not know how to get around this. Massey-Ferguson have their parts and International have theirs. If there was another source from which to buy parts, I am convinced parts would be at a lower price. At one of our earlier meetings the matter of a little wee part was brought up. It looked as if it would be worth \$2.50 and the cost was \$9.35 or something like that. Let us deal with the specific point: is there any way to get around this? I think Mr. Muir may have a supplementary question on this.

The CHAIRMAN: I think what we want to know is, is there any standardization of parts among the implement companies.

Mr. HALES: It stands to reason that if you have a broken part and only one firm makes it and only one part will do the job there is no alternative for you but to pay the price or go without it.

Mr. MUIR (*Lisgar*): Before I put my supplementary question, I may say that one of the frequent criticisms this committee has had on behalf of the farmer customers is the lack of standardization of parts within the individual machine companies in particular, and interchangeability of parts within the machine industry itself. Undoubtedly this adds to the cost of the repair part to the former consumer. It must also add to the cost of the inventory of parts that has to be carried by the dealer. I note that in this regard no recommendation has been made to the committee by your organization. I am wondering if any representation has been made, through your association on behalf of the dealers, to the machine companies on this particular subject.

Mr. SYKES: May I take the first part of the question. I think we are all familiar with the Canadian Tire stores. I think we all know how they serve us. I would say this: there are other sources of "will fit" parts. They are cheaper. I will say they are not as good, as has been proven by the farmer. They are comparable; they look the same. They are the same—they will operate for a time. Getting back to the automotive industry it is the same argument. The automotive industry presses genuine parts. I think we have the same condition here.

That is the part of the question which I wished to answer. I think perhaps some of the actual dealers might add something further.

Mr. HALES: I think this morning something was said about the fact that repairmen put their own prices on these parts. My experience has been that when I went to get a part he looked up the part in a book, whether Massey-Ferguson or International, and got the trade number. There was a suggested selling price on that part. I think this morning that was explained differently. Which is correct?

Mr. CHARETTE: We have a suggested retail price book for parts. I think most of the dealers, or all of them, will use that price book. There is a suggested price book for each company. From that price book to our cost the margin is approximately twenty-seven or twenty-eight per cent. That is why in our brief we say we have a margin on parts of about twenty-seven per cent. The only time a dealer might make his price is if a customer comes to his store and says he needs a part right away. If the dealer does not have it in stock—if it is a piece which he would very seldom sell—he would take the phone and phone the company to have it sent by express, and in certain places where there is an express service it would be there in the morning. This is at the demand of the farmer.

Mr. HALES: Does the manufacturer set the price of these parts?

Mr. CHARETTE: It is a suggested price.

Mr. HALES: He gives you a suggested selling price.

Mr. CHARETTE: Yes.

Mr. HALES: The man who makes the machine.

Mr. CHARETTE: Yes.

Mr. HALES: And you follow that price closely?

Mr. CHARETTE: Yes. The reason is that in most parts of the country—in northern Ontario dealers may be a little further apart; but in southern Ontario the dealers are pretty close and if the farmer goes to a John Deere dealer there is another dealer maybe ten miles away. One chap may boost his price up and the other fellow not.

Mr. HALES: The manufacturer can put any price he likes on that part because he has no competition and nobody else can supply it. The sky is the limit when he sets the price for that.

Mr. CHARETTE: Well, that is for the manufacturer. We have no way of knowing whether a cogwheel is worth \$2 or whether it is worth \$10. Although there may be only a few pounds of steel in that piece of equipment, there may be quite a bit of skilled work involved.

Mr. HALES: In my humble opinion, this is the crux of the whole problem, and this is where the farmer is over the barrel.

Mr. CLERMONT: Mr. Chairman, I am inclined to go along with Mr. Hales, in his view. If you will turn to page 18 of the brief, you will note that it says:

We have noted with considerable interest that from time to time there is a hint that major manufacturers may be involved in a type of combine where farm equipment prices are concerned.

Then, you go on to say that this is somewhat doubtful, as far as you are concerned. Also, you gave an example where five different block men did, in the course of one week, visit a franchise holder in an effort to secure his services for their particular company. As I said, you stated that there is no such thing as a combine. Is that the only example you can give us?

Mr. CHARETTE: Constant competition is the only example I have, and that is my own observation from visiting all phases of the industry.

Mr. ALLINSON: May I say a word, Mr. Chairman, in regard to competition from companies other than their own? There are plowshares and a few other small items which are made by outside companies. There is a company making "Will Fit" plowshares. In fact, there is more than one company doing this. There are various prices attached to these plowshares, and we find, invariably, that the prices are very much in line with the quality offered. We have noted that our farmers are not buying the cheaper share.

Mr. MONTGOMERY: In other words, you get only what you pay for?

Mr. ALLINSON: Yes.

Mr. SMALLWOOD: In connection with repairs, I drew Massey-Ferguson's attention to the cost of a feeder chain on the No. 79 combine. That chain was roughly \$75 a few years back, and the same chain last year cost \$110. Do you dealers have any idea why the price of that chain jumped to that extent?

Mr. ALLINSON: Would it be an obsolete item, one that is not used today?

Mr. SMALLWOOD: No; it was used from 1953 to 1958.

Mr. ALLINSON: I know, from our experience, that the cost of parts which are seldom used and, therefore, not in stock, normally is higher in price.

Mr. SMALLWOOD: This is a fast-selling chain, so your argument would not apply. I have been unable to find the reason for this, although I have my own ideas on it.

The CHAIRMAN: Have you a question, Mr. Southam?

Mr. SOUTHAM: I have a supplementary observation to make, Mr. Chairman.

I come from an area where there are many small villages and hamlets. It has been brought to my attention that after the rush let up after the last war, when we had our big sales of farm machinery, our farmers found themselves well supplied, and the dealer himself, in order to stay in business, has had to depend more and more on the disposal of repair parts. The suggestion has been made to me by the farmers in my constituency that the price of repair parts has gone up at a greatly accelerated speed. That would bear out Mr. Smallwood, a very practical farmer, who has said, that in the course of a couple of years there has been a 25 per cent increase in a feeder chain. Farmers think there is a tendency on the part of dealers to increase their profit and, as they are not selling sufficient units to show a good profit, they are depending to a larger extent on the sale of repair parts.

Mr. SYKES: I think it is unfortunate, but we have been led a little astray in the pricing of parts. As has been stated, there is a parts price book, and our dealers adhere to the price list. Although this group is willing to satisfy your request, I feel that the pricing of parts is the manufacturers' responsibility.

Mr. HALES: Has your organization ever appealed to the manufacturers along this line, and said to them: "Here, gentlemen, these prices are too high. Our farmer customers are complaining; we feel they are too high, and we therefore ask that you reduce these prices." Has your association gone that far?

Mr. SYKES: No, I would say not. I know of appeals by our dealers to their suppliers in some years past, but the appeal was: For goodness sake, allow us a little wider margin in order to sustain our operation.

Mr. HORNER (*Acadia*): In other words, this 27 per cent has grown, rather than reduced?

Mr. SYKES: No.

Mr. HORNER (*Acadia*): It has not?

Mr. SYKES: No.

Mr. HORNER (*Acadia*): It has remained the same over the past ten years?

Mr. SYKES: We were not very successful.

Mr. SOUTHAM: Mr. Chairman, I have another supplementary question. I would like to refer to percentages, and I am going back to some of the testimony we had with former witnesses. Going back over a 10 or 12 year period, it was said that machinery was about half the cost then that it is now, and using this 20 per cent formula on the over-all general mark-up, a combine in 1948, worth \$4,000 would give you \$800. Then, 14 years later, if you applied the same percentage, you find that a combine worth \$8,000—and that is twice the amount—would give you \$1,600. You will note that there is quite a large

jump there in the proportion of profits. The suggestion has been made to me that that percentage be cut down to 15 per cent, when you get up to these big units, and in that case that would give you a \$1,200 mark-up. Then, to project it further, for another 12 years into the future, say the same combine cost \$16,000, the result would be \$3,200 of profit. Is the cost of operating a business accelerating at the same percentage as the mark-up you are taking?

Mr. SYKES: My own observation would be that we all are well aware that the cost of living index and the cost of making a living index has gone high, and to boil that down, from our point of view, we cannot live on any less net profit.

Mr. SMALLWOOD: Do you find that the value of your trade-ins increase as the price of machinery goes up?

Mr. DICKSON: The value of your trade-in is worth more today than it was ten years ago. In other words, where there is not any trade-in, cash is taken off automatically.

Mr. GUNDLOCK: I have a supplementary question. You were talking about the cost of living index. In all fairness to the machine companies and the dealers, do you have a comparison, shall we say, as related to what is commonly referred to as inflation—general index as compared to the farm machinery price index?

Mr. SYKES: I am not speaking from any figures or statements; I am speaking from an opinion of my own as it affects my pocket. Although I am not a dealer, I am thinking of a dealer's pockets, when they go to pay out. Let me explain the situation this way. I am the employee of the board of directors, who are farm equipment dealers. Our office is in Toronto. I require secretarial help. I have had members of my board of directors tell me that they can hire a secretary in their community at \$25 a week, and why can I not do so. But, the same service to me in Toronto, on that basis, is \$65 to \$70 for the type of people I am looking for. I probably am wandering from the farm equipment industry, but I am attempting to bring out the fact that while conditions may vary from one community to another, everyone is looking for more money for the services that they are rendering.

Mr. GUNDLOCK: Mr. Chairman, I am a little bit doubtful as to whether the witness got my point. I was referring to the general machinery price index as compared to what is commonly known as the general rise, or some people refer to it as inflation. Is the farm machinery price higher on the same incline, or is it lower?

Mr. HORNER (*Acadia*): On page 52 of the evidence—

Mr. GUNDLOCK: In other words, what is the opinion of your dealers on this?

Mr. SOUTH: May I have that question again?

Mr. GUNDLOCK: I was trying to get the formal opinion of the dealers' organization as to whether or not the price of farm machinery has generally followed what we all commonly accept is a general incline—what some people commonly refer to as inflation. Is the price of farm machinery following the same incline, or is it lower?

Mr. SOUTH: I think you will find the price of farm machinery has climbed—

Mr. GUNDLOCK: In relation to all other commodities?

Mr. SOUTH: —in relation to how much more the farmer pays for his other goods, such as automobiles, television, and even his boots.

To answer this gentleman's question about the 20 per cent on higher priced equipment, like a \$6,000 combine compared to a \$2,000 trailer combine a few

years back, I admit, and I think we all admit, we try to adhere to the book price on parts. We do that for various reasons, one being that I do not know how else you could possibly handle it when you have thousands of parts on hand. You have to have something to go by. However, I may add that I do not remember having sold a tractor for the full list price. In fact, I think I would be laughed out of business if I even suggested it.

Mr. SHIELDS: This gentleman, Mr. Southam, referred to the \$4,000 combine and related it to the combine of today. The question we should keep in our mind is what was the combine he was talking about at that particular time. If he does that I can refer it to the Massey-Ferguson number. Was it the 21, which had a 22-inch cylinder, or the 27 which had a 23-inch cylinder and a draw bar with an electric lift? One can carry on to the combine like the 90, which has a 38-inch cylinder, with hydraulics and power steering.

If you take a lump sum figure, and the D.B.S. say so many combines were sold this year for so many dollars, and so many combines were sold last year for so many dollars, I think in all fairness to the farmers these figures should be broken down so that we can take the additional units and compare them, because there are changes in equipment which have helped to reduce some of the cost. Some of this equipment may have shield bearings which bring the cost down, and may have additional equipment which lowers labour costs. Therefore, some of the cost you mention should be weighed in relation to the item involved, and some consideration should be given to the various changes which have come about in the farm equipment industry.

These are factors which I suggest should be considered. I may mention that when I left the police force in 1948 my salary was under \$200 a month, while a constable today earns about \$350. There are changes everywhere we look.

Mr. GUNDLOCK: If I may deviate for a moment—and I shall return to the same question again—I have had a dealer tell me that “Ten or 15 years ago you were satisfied to take a tractor and drill to do so many acres a day and, if you are willing to take the same tractor and do the same work, without the drills, we can give you a tractor for the same price today.” Is that a fact or is it very close to a fact? In other words, 15 years ago we were content to ride a tractor with a steel wheel and lugs, minus hydraulics and all the other frills, to do so many acres a day. Now, for the same money, or close to the same money, can we accomplish that same thing today?

Mr. SHIELDS: Does the dollar buy the same—

Mr. GUNDLOCK: In relation to the value received.

Mr. SHIELDS: —in relation to the value received for the equipment? It must be remembered the equipment the farmers buy, they buy by choice.

Mr. GUNDLOCK: But, basically speaking, if we were content with the tractor we bought, say 20 years ago, how much difference would there be in its price today?

Mr. SHIELDS: I would say the material and labour involved, the increase in labour costs and the amount of tooling from that period to this period, would have to be taken into account.

Mr. GUNDLOCK: I have actually had a dealer argue that point with me and say: “We can give you almost the same service today as 15 years ago, for almost the same money”. They are admitting that automation and other things are producing the same equipment cheaper today.

Mr. CHARETTE: But the manufacturers do not produce the same product today as they did ten years ago.

Mr. GUNDLOCK: But they build a product which will give the same result, if we were contented with it as farmers.

Mr. CHARETTE: That is the big issue. That is where the difference lies.

Mr. GUNDLOCK: Admittedly none of us are content.

Mr. SHIELDS: I have a hard time selling a tractor only five years old.

Mr. GUNDLOCK: Returning to my former question, if I may, I think you probably misunderstood it. We are all familiar with what some people call inflation. I do not like to use that word myself, and term it the incline in prices generally. You have mentioned the increase in the cost of television and automobiles, and what I want to know is, is the price of farm machinery in that same incline or should it be above it or below it, in your opinion as a dealer organization? As a matter of fact I should add that we had a previous witness tell us that it was lower. I wonder would your association, as a dealer organization, agree with that?

Mr. CHARETTE: I think if you relate it to the horsepower of a tractor—

Mr. GUNDLOCK: No. I am only speaking generally.

Mr. CHARETTE: We cannot compare anything if you are just taking it generally. A few years ago a tractor with two horsepower was a three-furrow plow, but to-day that horsepower has increased so much at the demand of the farmers that we cannot compare it with lower horsepowers.

Mr. GUNDLOCK: I realize that.

Mr. CHARETTE: We cannot compare it, unless we take the cost per dollar per horsepower.

Mr. GUNDLOCK: I realize that, but we are speaking generally on farm prices. One witness who appeared before us said that farm machinery prices are below the general incline in the period we are speaking of. That is, in relation to automobiles, television sets and washing machines.

Mr. DICKSON: I would say that is my own opinion. We have to take it into consideration in general with the other lines of stuff we buy now. For instance, the shoes I have on, the same type of shoes, cost me \$10 or \$12 in 1948, but to-day they cost \$25 for exactly the same shoes.

I would think that the machinery as a whole might be not as high as some of the other materials we use—that is my own opinion.

Mr. ALLINSON: Actually, if I may go back seven years ago, my father bought his first tractor on steel wheels, it was maybe 20 years ago, and it took the price of ten cows to buy the tractor. Today, with ten of the average farmer's cows, you can buy a much better tractor.

Mr. FORBES: Do the manufacturers have a uniform contract or agreement with all the machine companies, and if they do is there a clause in the agreement requiring the dealer to charge prices that are quoted by the company?

Mr. CHARETTE: No. You cannot hold them down; the company does not hold us down to the suggested price. It is a suggested price and we can do whatever we like with it. It is not a price combine as far as we are concerned, but we very seldom get the price that is suggested. We cannot get it, that is all.

Mr. FORBES: That is the thing that bothers the farmer. He thinks the agent is doing what he likes respecting prices and repairs.

Mr. HORNER (*Acadia*): My question is on another point.

Mr. KORCHINSKI: I have a question on this point. In relation to the suggested price on parts I think you suggested that you normally follow the suggested price because you do not make a profit—if I am quoting you correctly—except in cases where you pick up the phone and the farmer comes in and wants his part; you can then have it expressed the same day. Did I understand you to suggest that in those cases you can make a profit?

Mr. CHARETTE: On those calls?

Mr. KORCHINSKI: On the parts.

Mr. CHARETTE: We still follow the suggested price list.

Mr. KORCHINSKI: But I understand that you can make a profit.

Mr. CHARETTE: If there is a phone call, we will ask a customer: would you be prepared to pay the phone call of 85 cents to get the part; because if he comes late in the afternoon even a wire or a letter will not get there for the same day.

Mr. KORCHINSKI: That was my question. The other question is: What would happen with express charges? Is it normal procedure to ask the farmer to pay for express charges in this case? You assume these?

Mr. CHARETTE: Generally, those parts come in by freight, but if there is the least amount of express, if it is only one parcel, it may be 75 cents, but if you have got two or three parts, the price is very negligible per part.

Mr. HALES: Just to finish this question on parts, and I think we will then have covered it. Are we right, first, in assuming that the farm machinery dealers have a suggested price laid down to them by the manufacturers for all the parts they sell? Secondly, the manufacturer of that part has a combine because his parts would only fit his machine.

Mr. CHARETTE: You cannot call that a combine.

Mr. HALES: He has a monopoly because those parts will only fit his machine; therefore, if he has a monopoly on those parts, about the only way we can get down to the basic problem here is to take one of those parts—any part you like—of any machine and have the combines investigation people make a research study on how much steel was in it, how much labour was in it, how much overhead, how much allowed for this, that and the other thing, and then see if that is a fair and legitimate price for which the farmer should be charged. How much further can we go than that on this study of parts?

Mr. CHARETTE: We are getting out of our jurisdiction. We cannot answer you as it would not be in our department to make such a request. As far as the companies are concerned, for a tractor, for instance, a similar part on one tractor would be approximately the same price as another similar part on the same sized tractor. That is the reason why we feel that there is competition between the companies.

Mr. HALES: In parts?

Mr. CHARETTE: Yes; if a farmer comes over to your place and he buys a part, he will remember four or five years from now that he bought such and such a part that will fit in that generator, and he will say, if it is higher from one firm than from the other: by heck, the next time I am going to buy such and such a tractor from this firm as the parts there are cheaper. So there is competition.

Mr. HALES: But until he changes his make of tractor, he has no alternative.

Mr. CHARETTE: As far as the news is concerned among the farmers, that is the best newspaper there is.

Mr. HALES: I do not follow that.

Mr. CHARETTE: I mean advertising.

Mr. HORNER (*Acadia*): On page 9 of the brief they say that the dealer is called rather than invited in to attend company-sponsored meetings. Does the dealer have to go, and does he have to pay his own way?

Mr. ALLINSON: I could answer that and say that nobody takes you by the hand and drags you there, but you are under obligation to get informed on the company's newer products and the company's sales policies, and so on. I would say: yes, you do pay your own way.

Mr. HORNER (*Acadia*): I have a supplementary question to that. At the top of page 9 you say that when the entertainment and the trip is over, the dealer sometimes signs to his consternation a sales order for a much larger amount of goods than he can conveniently handle. I think they are referring to his purchase of new equipment, not parts. Is he stuck with that amount of goods that he cannot handle?

Mr. ALLINSON: To that I can say that I was a party invited as an outside dealer to a long trip. I enjoyed it very much and several dealers who went with me became dealers of that company, signed large orders—probably because they were carried away a little—but whether or not they stuck with them I cannot tell you. The outcome of the trip was that several dealers changed their dealer franchises and came home with large orders.

Mr. HOWE: I have another question, Mr. Chairman, in connection with this same dealer-company relationship. On the bottom of page 9 it is indicated that service schools are conducted by the companies, and dealers are encouraged to send their personnel so as to keep informed on the mechanical functions and services required for their own company's equipment. Then I notice, on page 10, that this is charged to the dealer later—he finds it on his invoice. Farther down, in the same paragraph on page 10, I see where the advertising, and one thing and another, are charged up to the dealer on a pro rata basis on his monthly invoice. Is that added to the cost of a certain machine each time he buys one order, he then gets a statement at the end of the month showing how much he has to pay towards these promotional campaigns, or is it added to the price of the machine?

Mr. SYKES: No, those are parts of the dealer's overhead expenses. That does not alter the picture as far as placing the goods is concerned.

Mr. HOWE: Does this pro rata amount for advertising and schools appear on the invoice?

Mr. ALLINSON: In regard to the amount charged back to the dealer for, let us say national advertising, the companies I represent do not take any part in local advertising. In other words, we do not get any financial support for ads we put in our local papers. They say that instead of giving us an amount of money for local advertising, they use that amount of money, proportionately to it, for national advertising. Now on special advertising where we get invoices for certain mailings, maybe three or four times a year, literature will go to the farmers in your district direct from the company's office. That literature will be charged to the dealer. He will get an invoice for so many cents per copy, covering mailing, postage and so on. Maybe two or three times a year they will get a special package of advertising material. That will be charged to us on a special invoice for that particular package. We may use that for banners and things to put up in our shop, probably new leaflets, extra supplies of illustrated literature, and so on. That is charged directly to us on an invoice to that effect.

Mr. HOWE: National advertising is included?

Mr. ALLINSON: I have never had a bill for national advertising, and I have been told by my companies that instead of giving us a proportion of the local advertising they would take that proportion which would normally be mine and use it for the benefit of national advertising, and people in my territory would get it through the national newspapers.

Mr. CLERMONT: Have you any idea of the percentage which comes from your company—1 per cent or $\frac{1}{2}$ per cent?

Mr. ALLINSON: I am not able to answer that.

Mr. HOWE: I felt that according to that paragraph some of the national advertising was charged back to the dealer—large newspapers and television programs and things like that.

Mr. ALLINSON: I cannot say. I know that it is not by my company, but I understand there are companies where the dealers are charged a proportion of the television program costs, and so on.

Mr. HOWE: Where does that appear on the dealer's invoice? Does it appear as an extra charge on the bottom of the invoice?

Mr. ALLINSON: I could not answer that because it is not my company. I have never received one.

Mr. MILLIGAN: Do you supply the names of the people to whom this literature is sent by the companies?

Mr. ALLINSON: Yes, they ask us to send in a mailing list of the farmers in our area and the company in turn mails the literature direct to them, on the list we give them. Then they send us an invoice at so many cents per name for mailing it.

Mr. MILLIGAN: In other words, you would have control of that, because the charge would compare with the number of names you send in.

Mr. ALLINSON: Yes. We are charged so much per name on the mailing list.

Mr. HOWE: Is there anything to indicate what the companies charge their dealers for this national advertising?

The CHAIRMAN: Are there any dealers who can answer that?

Mr. SOUTH: I think the company we are thinking about is not represented here.

Mr. HOWE: There is just one company which does that, that you know of?

Mr. SOUTH: All I know of is what dealers from one particular company have told me, that they do pay a share of this advertising. If we want to supplement it in any case, if we want to have our name on the trailer of a national T.V. program, we pay the television station for that. Or, if it is a national broadcast and we want our name added, we pay for that. Our company has discontinued charging us for some years now for a share of the advertising costs.

Mr. HENDERSON: The firm would be Massey-Ferguson then?

Mr. SOUTH: Yes.

Mr. SYKES: I must say, as an independent person, that I am sorry we do not have representatives here from all of the manufacturers. In my own experience I have seen two instances of the invoices you ask about. It is a separate invoice, marked advertising, and the figure appears.

Mr. HOWE: The figure appears—it is not added in in the price of an individual machine as it comes along?

Mr. SYKES: No, it is treated in the same manner as a parts invoice which is payable in 30 days, cleaning it up at the end of the month.

Mr. GUNDLOCK: A few questions ago there was talk about competitive prices of parts. There is one part in particular in which there is quite a good deal of competition, and I would like to have your opinion about it. I am referring to ball bearings, as related to some of the farm machinery in manufacturers' prices and, shall we say, the automobile price. I heard the word generators mentioned, and it is a good example. A generator bank for a tractor costs a little more than it does if you go to an automotive dealer, or some independent bearing dealer. The front wheel bearing is an example.

Mr. SYKES: I think it would be the other way around.

Mr. ALLINSON: I could cite a case. We happen to be in a location where in case of necessity we can buy a certain bearing from an automotive wholesale outlet. Normally with the bearings we try to carry, we get them through our company. But there is a difference. Right offhand, I think the difference is about 20 per cent in favour of the agricultural implements.

Mr. GUNDLOCK: I have found just the opposite in my experience, but it was with a different company probably. I can buy a bearing from a truck parts list, and it works all right on a tractor.

The CHAIRMAN: Gentlemen, it is now past 5.30. It is possible we may finish by six o'clock if we do not entertain too many supplementary questions. I have the names of four gentlemen who wish to speak. They are Messrs. Forbes, Montgomery, Horner (*Acadia*), and Clermont. When they are finished, we might get back to supplementary questions.

Mr. KORCHINSKI: I do not know what you are going to do in my case, because my question was not a supplementary one.

Mr. MONTGOMERY: I have been sitting here today, and I do not think we are getting very far by way of obtaining the information that we want to help us in our report. I would like to compliment the people who drew up the brief on this point. I think they went into it from their standpoint. I think they have shown us the information that we need to indicate where they fit into this picture.

As I see it, with respect to farm machinery they are supposed to be operating within a bracket of 20 per cent. But I believe from the information we have received to date that very few of them at least ever get that 20 per cent.

On the parts side of it, the bracket is 27 per cent. We may try as hard as you like, but I do not see how we can press these people down so that we can bring the cost of farm machinery down.

We are out to see where to place the blame for the high cost, as some people put it. So I shall end with this question, and stop there. I do not think that all these little details we have been going into are going to help us much. I would like to ask this question: have you a suggestion—I see none in the brief—but have you any suggestion as to how the cost of farm machinery could be reduced? From your own knowledge and within your sphere or field of operations, have you any suggestions as to how the cost of farm machinery can be reduced?

The CHAIRMAN: Which one of you gentlemen cares to try that one on?

Mr. SOUTH: There was something which was not mentioned here when trying to answer the general question on the full overall increase of farm machinery equipment. Was that not your question?

Mr. GUNDLOCK: As compared to the general incline of all commodities, export goods, and durable goods.

Mr. SOUTH: In my own particular case, in connection with the last 100 tractors I sold, about 95 of them were made outside of Canada. I think this shows that there is this sliding scale.

Getting back now to the question about parts, we imported filters for all makes of tractors and sold them for about half the price of a Canadian distributed filter. But now the government makes us pay duty and sales tax on these very same filters, so now we are not handling them any more.

Likewise with the parts you mentioned. They can be, or could be made to fit. There are plenty of places outside Canada where many parts fit various makes of machines. Some cost considerably less money. But there again we are stopped by import restrictions.

Mr. DUNLOP: Are you saying there should be a duty on farm machinery repairs?

Mr. SOUTH: It has been brought out here before I came that a tractor coming over from Detroit with a power take-off unit on it could come in with no duty on it.

Mr. GUNDLOCK: But that was corrected some years ago.

Mr. SOUTH: If you get a power take-off attachment in Detroit now, you have to pay duty on it. And while we are supposed to have free trade, in the case of a steel farm wagon, coming from the United States, the importer has to pay duty on it. There is no question about that.

Mr. GUNDLOCK: Let us get back to the power take-off unit. I understand that was the case a few years ago, but that now it has been corrected.

Mr. SOUTH: It comes up every time we try to bring anything across like that.

Mr. GUNDLOCK: I mean a new item.

Mr. SOUTH: I think if you go back to your power take-off you will find the same problem every time.

Mr. GUNDLOCK: Is the power take-off dutiable now?

Mr. SOUTH: Yes.

Mr. GUNDLOCK: Who answered in respect of this this morning?

Mr. SYKES: I did. I think there is a little difference between Mr. South and me on this. I will go along with Mr. South on the filters and many things that are interchangeable. We talked about batteries, tires and so on. I think one of the biggest problems facing the farm equipment dealer is what we usually refer to as the end user certificate. I believe it is possible for Mr. South to bring the filters in. He will pay duty on them. He will sell them for agricultural products. He will get an end user's certificate and will get reimbursement two or three years from now; maybe I am extending myself a little, but I know it will be six months.

Mr. GUNDLOCK: That is a matter of opinion. Is the power take-off dutiable now that was not before, and are the repairs dutiable now that were before?

Mr. SOUTH: I was thinking about the power take-off drive shaft. I had occasion to bring in quite a few this year for snow blowers and there was duty on them.

Mr. GUNDLOCK: That is another matter. We are speaking about a power take-off now.

Mr. SOUTH: That was my error. I was speaking about a power take-off shaft.

Mr. HENDERSON: What about tires? That is something we all use on tractors. Are they getting higher or lower? I will tell you a story. I was in California. A chap was standing on the lawn and I said to him "what's doing?" he said "well, we have found out that Harvey Firestone made \$20 million and we are going to get a piece of it; we are going on strike tomorrow." They did. What happened? The tires cost more money.

Mr. HORNER (*Acadia*): On page 20 of the brief you go on to say that many manufacturers, in whose hands the fate of the dealer remains, are today closing out the dealer who fails to reach a satisfactory volume condition. Is this actually happening? Is it happening with all the major manufacturers?

Mr. ALLINSON: In answer to that I can only give you something which was said verbally at a meeting I attended where a certain representative addressed dealers. He told them that the day had come when the dealer selling less than \$10,000 worth of equipment could not be profitably serviced by any company and could not possibly survive himself.

Mr. HORNER (*Acadia*): But that has not actually happened yet?

Mr. ALLINSON: Not to my knowledge.

Mr. HORNER (*Acadia*): On page 21 you talked about tests and a similar test set-up in Canada. The Massey-Ferguson brief figured out that three per cent of their sales was spent in research and testing of equipment. They also said that the tests carried out by the Saskatchewan government cost them money. They did not say how much. They also said they contributed towards the Nebraska test. Do you really feel that if the Canadian government set up a testing program that it would not be duplicating the work done at Nebraska?

Mr. SYKES: They would be. Within the industry we have accepted the Nebraska test for many years. It would be a duplication. In my observation I could see that perhaps this committee would recommend testing. My fear is that it would require testing in each province. Frankly, I am opposed to so many testing centers. I think perhaps, in placing it as I have in the brief, that one Canadian test center would satisfy criticism from the user, assist the dealer in a knowledge of the ability of his machine, and would make for happiness.

Mr. HORNER (*Acadia*): But, we are worried about the costs. We do not want to increase the cost of these machines; we want to keep them down. Massey-Ferguson already are spending 3 per cent of their sales on testing and research. They claim the Nebraska test costs them money, and that the Saskatchewan tests cost them money. Should we, as a committee looking into these matters, recommend that a further testing station be set up? You did say that it would be a duplication, to some extent, of the Nebraska test?

Mr. SYKES: Keeping in mind what this committee is working towards, I would say definitely no.

Mr. CLERMONT: Mr. Chairman, the witnesses were asked this morning if it would be possible for them to leave some blank contracts with the Committee.

Mr. SYKES: We have only a very few. This is an agreement form of Commercial Credit Corporation.

Mr. CLERMONT: On page 7, you mentioned competition, and on page 11, you mentioned trade-ins. Keeping this in mind, would not that place you in the same sphere as other businesses, such as the white goods industry, and so on, where competition, in itself and, in so far as trade-ins are concerned, is very keen. Do you not think that the situation is the same everywhere in this competitive world today?

Mr. SYKES: I agree with you.

Mr. HORNER (*Acadia*): About the middle of page 18 of the brief, it goes on to say:

While there are no closed territories for the farm equipment dealer, there is an understanding that he has such-and-such a territory.

In other words, some dealers agree on areas in which they will operate. Is this a widespread practice?

Mr. SYKES: Agreements in so far as territories are concerned?

Mr. HORNER (*Acadia*): Yes.

Mr. SYKES: I would suggest that when a dealer takes a franchise from a company, it is generally assumed that such-and-such a territory is their area. I think it is quite general. In some cases, though, it might create a bit of confusion.

The CHAIRMAN: Who maps out that general area, the franchise dealer himself, or the company?

Mr. SOUTH: Although most contracts call for an area, there are no defined lines of territories.

The CHAIRMAN: In other words, it is an unwritten definition of your boundaries?

Mr. SOUTH: Yes.

Mr. MONTGOMERY: It could overlap?

Mr. SYKES: May I contribute something to the committee? Through an interchange of literature and so on, it has come to my attention that a survey was made in the United States as to whether or not the farm equipment dealers would be content in a bill being presented to their government to give dealers closed territories. The result of that survey was that the dealers were in favour of closed territories in the United States. I am not saying that the same applies in Canada, but that was the majority opinion there.

The CHAIRMAN: Mr. Korchinski?

Mr. KORCHINSKI: Mr. Chairman, I want to revert to a question which I have been trying to bring in for some time.

Do these manufacturers insist that you have a particular type of building, showcases, storage bins, so much space for this and that, and so on, as well as having to have a mechanic? Is this their general policy?

Mr. SOUTH: No manufacturer is forcing the issue now. After the war, when it was a pretty profitable business, the companies were in a position to force that on the dealers, with the result that a lot of premises were put up. They have made suggestions to me as to how I might modernize my place, or rebuild my parts department, but at no time have I had any pressure put on me to spend money which I did not think was practical.

Mr. KORCHINSKI: I can remember a case where they asked the dealer to move from one town to the next, and that was an expenditure that he had to recover from the farmer. This is my point. If this floor space had to be there for storage and display, it would result in increased licensing, and so on. Am I to understand that this is not a general policy?

Mr. SOUTH: You say a company asked them.

Mr. KORCHINSKI: As far as I know, they asked them to move. So far as I know it was company policy, and they moved seven miles.

Mr. SOUTH: I do not know of any case of that happening.

Mr. KORCHINSKI: In other words, you can absolve the manufacturers and say they had nothing to do with it. If they built larger show cases, it was the dealer's own responsibility?

Mr. SOUTH: There was no pressure put on me at any time to spend money that way.

Mr. KORCHINSKI: Some of the manufacturers have pulled out their warehouses from certain points. In the case I am familiar with, they used to have a distribution point at Yorkton but now the distribution point is in Winnipeg. Instead of a phone call costing 35 cents it is now \$1.55 and that, in the end, is recoverable from the farmers. The machinery companies, in order to make their operations more efficient have not weighed how this is going to affect the farmers' savings in any way.

Mr. SYKES: An area very close to us had a distribution centre, or a branch, at one time, which made it very easy to get many of these items overnight, or within a matter of a few days. However, it was made very difficult when the branch was closed and dealers over a wide area were left without it. The point I am trying to make is that now the dealers must order their next year's stock in November, due to that lack of service. The dealer must now take the responsibility in his own area and he invests his own money in the parts, in order to serve his customers. That is our opinion on that particular situation, from the dealer's point of view.

Mr. SOUTHAM: I have a supplementary observation to make on this discussion about the pattern which has been developing in the farm machinery industry, the pattern which is moving from the small distributor to the larger one. We have had evidence given before this committee, and it has been discussed here to-day, that there are fewer dealers operating to-day. In your opinion, would it reach saturation point when this pattern would become more costly for the customers? I am thinking in terms of a farmer going 20 or 30 miles in order to make a deal or get service. When do you think we will reach the saturation point, when distance would mean increasing the cost to the farmer of purchasing his machinery and getting service? Do you think there is room for further development in that reduction of dealerships? We hear complaints about this in remote areas where farmers have to go 20 or 30 miles to get service from Massey-Ferguson or Case.

Mr. SYKES: Mr. Allinson mentioned a few minutes ago, or rather his answer suggested it was general company policy that the smaller dealers will disperse.

Mr. SOUTHAM: My point is that I do not want the cost increased to the farmers in getting service for their machinery.

Mr. SYKES: In my opinion it is going to increase the cost of the dealer's operation. He will have to have more parts in his place of business, and that means his overheads are going to rise. It is going from a small operation to a big one.

Mr. SOUTHAM: That would answer my question. It would be axiomatic for the farmers to pay more in the long run. The customer will have to pay that much more of the cost in order to support the dealer.

Mr. MONTGOMERY: But is not the dealer operating within the 20 per cent bracket, and so it does not matter if there are 10 dealers or 20 dealers?

Mr. SYKES: That is what I should like to say, that the dealer, is more or less harnessed to the price and if the dealer's price goes up—

Mr. SHIELDS: The volume has to increase too.

Mr. SYKES: And that might be where a slight volume discount could assist him.

Mr. HOWE: Supplementary to these questions regarding size of dealers and the number of small dealers going out of business, we all know of small dealers who have their wives assisting them in their business but, when they become big dealers they have to have hired help, expensive help. Is this trend towards larger dealers good for the farmers?

Mr. SOUTH: I would say it is good for the farmers in that I do not think the small dealer, who has his wife helping him, can give the service which farmers require today. Such a dealer cannot afford a shop with several thousands of parts and special equipment. In any case, so far as parts equipment is concerned, there is more variety today, and therefore I think it is for the good of the farmer to have a larger dealer.

Once they get into that business, it is their way of life, they are stuck. As someone suggested here, in Manitoba he could not sell out if he wanted to. It is not that lucrative, but it is certainly the best deal for a farmer. We probably talk from a selfish point of view because they have large dealerships.

Mr. WEBB: I was wondering if the companies had a minimum shipping charge on small parts. On appliances, they might get a 15-cent spring but when a farmer gets it it would cost him \$15. It does cost the companies considerable to process invoices and packages. You could get three of the springs for the same price for which you get one. Did that enter into a lot of the small parts?

Mr. ALLINSON: The major line companies. I do not know about some of our smaller specialty lines, getting back into maybe lawn and garden equipment—they do have a minimum of \$2. If you order more than \$2 worth, you get everything that is charged, but the minimum package is \$2. To the best of my knowledge, that does not exist in any of our major companies.

Mr. BOULANGER (*Interpretation*): I do not know if this question has already been put, but who pays the shipping charges from the manufacturer to the dealer?

Mr. ALLINSON: The dealer.

Mr. HOWE: I have one further question with regard to this suggestion that in the United States they are talking about closed territory. If we get that in Canada, do you think that will increase the cost of farm machinery to the farmer? Will it reduce the competition?

Mr. CLERMONT: I will move that the agreement of purchase be placed as an appendix.

Mr. HALES: Mr. Chairman, I have one question.

The CHAIRMAN: Just a moment, there is some other information that was asked this morning. Mr. South brought it forward. Is it agreeable that this agreement of purchase be placed as an appendix? The committee is agreed.

Mr. HALES: Are the certificates used to any great extent, Mr. Sykes?

Mr. SYKES: Yes.

Mr. HALES: Did I understand you to say that it took as high as three years to get your money back for them?

Mr. SYKES: I did not go as far as three years—I said two.

Mr. HALES: Your association would then recommend that we bring this to the attention of the department to speed up their return? We will be very glad to put that recommendation in our report.

Mr. SOUTH: I am wondering if this gentleman has his information correctly. We have certificates for imported machines of any kind, in which case we do not pay the tax or duty in advance. It is only on special occasions on some specialty item coming in, possibly from the United States, where it has been paid and we apply to get it back. But do not let us get it wrong on imported tractors. The dealer or customer does not pay that, but he does sign that it is used for agricultural purposes.

Mr. MILLIGAN: You do not have duty on tractors or machinery coming from the United States?

Mr. SOUTH: You have to prove in the certificates that it is for agricultural purposes.

Mr. MILLIGAN: Then there is no duty charged?

Mr. SOUTH: If we do not use the certificate, the company will charge it back to the dealer.

Mr. HORNER (*Acadia*): On page 15, on mechanics, my question is: are mechanics generally hired by the hour?

Mr. CHARETTE: By the hour.

Mr. HORNER (*Acadia*): This unassigned time of one hour per day, would it not be a factor in charging \$3 an hour?

Mr. SHIELDS: Hours are assigned by the manufacturer.

Mr. HORNER (*Acadia*): Do you pay them for an eight hour day, whether they put in an eight hour day or not?

Mr. SYKES: Yes.

Mr. HORNER (*Acadia*): That would mean paying them per week or per month, and not actually by the hour.

Mr. SYKES: They are not paid by the hour.

Mr. HORNER (*Acadia*): I have one other suggestion. It is that the clerk of the committee should contact some of the other firms such as J. I. Case, Oliver, Allis Chalmers, and Minneapolis-Moline to see if they would submit briefs to this committee. This arises out of the remarks made by Mr. Emmert, the vice-president of Massey-Ferguson who suggested that we hear from as many manufacturers as possible. I should particularly like to have these four companies. While they may manufacture in the United States, they still have a sales agency and distribution system in Canada. I feel we should have them before the committee to have their views as to their distribution costs, or manufacturing costs.

The CHAIRMAN: If it is agreeable, I will ask about that at the next subcommittee meeting.

I am sure we are unanimous in expressing how much the members of this committee appreciate having Mr. Charette, Mr. Sykes and the other members of their organization here today to give some information on the position in which they find themselves as dealers.

Mr. SYKES: Mr. Chairman and gentlemen, we would like to say how much we appreciated your cooperation, and that we have enjoyed sitting in at this committee. Thank you very much.

The CHAIRMAN: We thank you very much indeed for your contribution today. We will adjourn now until Friday, May 12, at 9.30 a.m. when the International Harvester Company representatives will be in attendance.

CONDITIONS

IT IS UNDERSTOOD AND AGREED THAT ALL PAYMENTS BY THE BUYER ARE TO BE MADE TO THE OFFICE OF COMMERCIAL CREDIT CORPORATION LIMITED, AS HEREAFTER DESIGNATED.

BUYER AGREES: THAT TITLE, OWNERSHIP AND RIGHT OF PROPERTY IN THE SAID GOODS SHALL NOT PASS TO THE PURCHASER UNTIL ALL SUMS DUE UNDER THIS CONTRACT ARE FULLY PAID IN CASH INCLUDING THE PAYMENT OF ANY NOTE, RENEWAL NOTE, JUDGMENTS SECURED, AND ANY AMOUNTS PROPERLY PAID BY SELLER TO OBTAIN POSSESSION OF SAID PROPERTY; THAT NO TRANSFER, RENEWAL, EXTENSION OR ASSIGNMENT OF THIS CONTRACT OR ANY INTEREST HEREUNDER, OR LOSS, DAMAGE, INJURY OR DESTRUCTION OF SAID PROPERTY SHALL RELEASE BUYER FROM HIS OBLIGATIONS HEREUNDER; TO KEEP SAID PROPERTY FREE OF ALL TAXES, LIENS AND ENCUMBRANCES; NOT TO CONCEAL THE PROPERTY OR REMOVE IT FROM THE PROVINCE IN WHICH IT IS LOCATED AT THE DATE HEREOF OR TRANSFER ANY INTEREST THEREIN OR IN THIS CONTRACT WITHOUT WRITTEN CONSENT OF THE SELLER OR ASSIGNS; TO PAY ALL EXCHANGE CHARGES ON PAYMENTS AND ALL RECORDING, FILING AND SATISFACTION FEES IN CONNECTION HERewith; IN THE EVENT OF DELINQUENCY TO PAY A REASONABLE COLLECTION OR DELINQUENCY FEE TO REIMBURSE THE SELLER OR ASSIGNS FOR EXPENSE CAUSED THEREBY; THAT SELLER'S ASSIGNEE SHALL BE ENTITLED TO ALL RIGHTS OF SELLER.

TIME IS OF THE ESSENCE OF THIS CONTRACT. IF BUYER DEFAULTS IN COMPLYING WITH ANY OF THE TERMS OR CONDITIONS HEREOF, OR SELLER DEEMS HIMSELF INSECURE OR THE PROPERTY IN DANGER OF MISUSE OR CONFISCATION (OF WHICH THE SELLER SHALL BE THE SOLE JUDGE), OR IF A PROCEEDING IN BANKRUPTCY, RECEIVERSHIP OR INSOLVENCY OR FOR COMPOSITION OR EXTENSION OF DEBTS OR OTHER OBLIGATIONS BE INSTITUTED BY OR AGAINST THE BUYER OR THE SAID PROPERTY, THE FULL AMOUNT THEN UNPAID HEREUNDER SHALL BECOME IMMEDIATELY DUE AND PAYABLE WITHOUT NOTICE, AND SELLER OR HIS ASSIGNEE OR AGENT OR ANY SHERIFF OR OTHER OFFICER OF THE LAW MAY EITHER: 1. COLLECT THE SAME BY SUIT OR OTHERWISE, OR 2. RETAKE POSSESSION OF SAID PROPERTY WITH OR WITHOUT PROCESS OF LAW, AND FOR THIS PURPOSE MAY ENTER ANY PREMISES WHERE SAID PROPERTY MAY BE FOUND AND REMOVE THE SAME AND CONCURRENTLY WITH ANY SUIT FOR THE UNPAID BALANCE HEREUNDER MAY, SUBJECT TO THE LAW APPLICABLE THERETO, SELL THE SAID PROPERTY EITHER AT PUBLIC OR PRIVATE SALE, WITHOUT NOTICE TO BUYER WITH OR WITHOUT HAVING THE SAID PROPERTY AT THE PLACE OF SALE, AT WHICH SALE SELLER MAY BID, AND APPLY THE PROCEEDS OF SAID SALE, AFTER FIRST DEDUCTING ALL REASONABLE EXPENSES AND CHARGES OF OBTAINING AND KEEPING POSSESSION OF SAID PROPERTY AND OF SAID SALE, INCLUDING REASONABLE SOLICITORS' FEES TO THE AMOUNT UNPAID HEREUNDER, AND ANY SURPLUS SHALL BE PAID TO, AND ANY DEFICIENCY SHALL BE PAID BY THE BUYER, INCLUDING ANY REASONABLE SOLICITORS' FEES AND COURT COSTS INCURRED IN THE RECOVERY OF SUCH DEFICIENCY.

THERE ARE NO REPRESENTATIONS, WARRANTIES, COLLATERAL AGREEMENTS OR CONDITIONS EXPRESS OR IMPLIED STATUTORY OR OTHERWISE WITH RESPECT TO THE PROPERTY OR THIS CONTRACT OR AFFECTING THE RIGHTS OF THE PARTIES OTHER THAN AS SPECIFICALLY CONTAINED HEREIN.

BUYER HEREBY WAIVES NOTICE OF ASSIGNMENT OF THIS CONTRACT AND OF TITLE IN SAID PROPERTY. THIS CONTRACT REPLACES ALL OTHER CONTRACTS OR ORDERS EXECUTED PRIOR TO THE DATE HEREOF.

WHEREVER THE WORD "PROPERTY" IS USED HEREIN IT SHALL INCLUDE THE PROPERTY DESCRIBED COMPLETE WITH ALL ATTACHMENTS, EQUIPMENT, ACCESSORIES AND REPAIRS ATTACHED OR APPLIED THERETO.

THIS AGREEMENT CONSTITUTES THE ENTIRE CONTRACT BETWEEN THE PARTIES, AND SHALL BE BINDING UPON AND INURE TO THE BENEFIT OF THE PARTIES AND THEIR RESPECTIVE HEIRS, EXECUTORS, ADMINISTRATORS, SUCCESSORS AND SUBJECT TO THE FOREGOING, THEIR RESPECTIVE ASSIGNS, ANY PROVISION OF THIS CONTRACT PROHIBITED BY LAW OF ANY PROVINCE SHALL, AS TO THE SAID PROVINCE, BE INEFFECTIVE TO THE EXTENT OF SUCH PROHIBITION, WITHOUT INVALIDATING THE REMAINING PROVISIONS OF THE CONTRACT.

ASSIGNMENT MUST BE SIGNED BY SELLER

FOR VALUE RECEIVED, WE HEREBY SELL, ASSIGN, AND TRANSFER TO COMMERCIAL CREDIT CORPORATION LIMITED, ITS SUCCESSORS AND ASSIGNS, THE WITHIN CONTRACT, AND ALL RIGHT, TITLE, AND INTEREST IN AND TO THE PROPERTY THEREIN DESCRIBED, AND ALL RIGHTS AND REMEDIES THERETO, INCLUDING THE RIGHT TO COLLECT ALL INSTALLMENTS DUE THEREON AND THE RIGHT EITHER IN ASSIGNEE'S OWN BEHALF OR IN OUR NAME, TO TAKE ALL SUCH PROCEEDINGS, LEGAL OR OTHERWISE, AS WE MIGHT HAVE TAKEN, SAVE FOR THIS ASSIGNMENT; AND WE WARRANT THAT THE CONTRACT IS GENUINE, ENFORCEABLE, AND THE ONLY CONTRACT EXECUTED FOR THE PROPERTY DESCRIBED THEREIN; THAT ALL STATEMENTS THEREIN CONTAINED ARE TRUE; AND THAT THE PROPERTY WAS DELIVERED TO AND ACCEPTED BY BUYER.

IN THE EVENT OF DEFAULT BY BUYER IN THE PUNCTUAL PAYMENT OR PERFORMANCE OF HIS OBLIGATIONS UNDER THE CONTRACT, WE WILL, EXCEPT AS HEREINAFTER PROVIDED, ON DEMAND, PURCHASE THE INTEREST OF ASSIGNEE IN THE PROPERTY DESCRIBED IN THE CONTRACT IN ITS THEN LOCATION AND IN ITS THEN CONDITION, AND WILL PAY TO ASSIGNEE THEREFOR THE UNPAID BALANCE DUE THEREON, PLUS EXPENSES OF REPOSSESSION AND COLLECTION, IF ANY, INCLUDING, SOLICITORS' FEES. UPON OUR FAILURE SO TO PAY UPON DEMAND, ASSIGNEE MAY SELL THE PROPERTY DESCRIBED IN THE CONTRACT AT PUBLIC OR PRIVATE SALE, WITH OR WITHOUT NOTICE, AND WE SHALL BE LIABLE TO ASSIGNEE FOR ANY DEFICIENCY BETWEEN THE UNPAID BALANCE PLUS SAID EXPENSES AND THE NET AMOUNT THUS COLLECTED AFTER DEDUCTING COSTS OF SALE THEREFROM. WE SHALL NOT BE OBLIGATED TO REPURCHASE THE PROPERTY OR TO PAY ANY UNPAID BALANCE OR DEFICIENCY ON THE CONTRACT, OR OTHERWISE, IF ALL OF THE PROPERTY SHALL HAVE BEEN CONVERTED OR COMPLETELY DESTROYED BY CAUSES OTHER THAN THE USE THEREOF OR IF THE LOCATION THEREOF SHALL BE UNKNOWN TO US AND TO ASSIGNEE. IF A PORTION, BUT NOT ALL, OF THE PROPERTY SHALL HAVE BEEN CONVERTED OR COMPLETELY DESTROYED BY CAUSES OTHER THAN THE USE THEREOF, OR THE LOCATION THEREOF SHALL BE UNKNOWN TO US AND THE ASSIGNEE, WE SHALL ON DEMAND PURCHASE ASSIGNEE'S INTEREST IN THE REMAINDER OF THE PROPERTY AT ITS THEN LOCATION AND IN ITS THEN CONDITION, AND PAY THEREFOR THAT PORTION OF THE UNPAID BALANCE, PLUS SAID EXPENSES, AS THE TOTAL CASH PRICE OF THE REMAINING PROPERTY BEARS TO THE TOTAL CASH PRICE OF ALL THE PROPERTY. WE AGREE THAT ASSIGNEE MAY AUDIT OUR BOOKS AND RECORDS RELATING TO CONTRACTS SOLD TO IT AND AGREE THAT WITHOUT NOTICE TO US AND WITHOUT RELEASING OUR LIABILITY ASSIGNEE MAY RELEASE ANY RIGHTS AGAINST AND GRANT EXTENSIONS OF TIME OF PAYMENT TO THE PURCHASER, AND WE WAIVE PRESENTMENT AND DEMAND FOR PAYMENT, PROTEST, OR NOTICE OF PROTEST. WE SHALL HAVE NO AUTHORITY, WITHOUT ASSIGNEE'S PRIOR WRITTEN CONSENT, TO ACCEPT COLLECTIONS, AND/OR REPOSSESS AND/OR CONSENT TO THE RETURN OF THE PROPERTY AND/OR MODIFY THE TERMS OF THE CONTRACT.

TERMS AND CONDITIONS (Continued from reverse side)

4. It is further agreed that if there is default in payment of any one of the said instalments as it becomes due and payable or in payment of taxes or charges on the said property or if the said property is misused or is used for any illegal purpose or is levied upon, or if the Purchaser attempts or purports to sell or remove or take steps to remove the said property from the County or Registration District in which the Purchaser resides or resided at the time of the purchase of the said property (or from the Registration District where the said property is delivered, if the same is delivered elsewhere than in the Registration District in which the Purchaser resides or resided at the time of the said purchase), or if at any time the vendor shall deem the purchaser to be insufficiently secured, or if the purchaser or his property be involved in any proceedings in bankruptcy, receivership or insolvency, then and in any of such events the entire balance of the purchased price shall, at the option of the vendor, become immediately due and payable, and the vendor in addition to all other remedies available to the vendor at law or hereunder, may take possession of the said property wherever found, and sell the same at either public or private sale (with or without notice) at such price and on such terms as the vendor in the vendor's discretion considers reasonable, with leave to the vendor to bid at any such public sale, pay all expenses incurred thereby, including repairs and replacements, taxes and expenses of repossession and of sale, and apply the net proceeds on the purchase price, and in consideration of the use of the said property and for diminution in saleable value thereof and as liquidated damages, and not as a penalty, the vendor may at all times retain all payments made on account of the purchase price.
5. Any such sale or right of sale shall not affect the vendor's right to sue or the purchaser's liability for any balance of the account remaining unpaid and including repairs and replacements nor shall the vendor's right to retake possession of and sell the said property be merged in any judgment the vendor may recover for the purchase price or any security therefor, nor shall the entry of judgment for unpaid purchase price or the taking of additional security therefor constitute a waiver of the reservation of title herein contained until the purchase price and any note or notes given therefore are fully paid in cash.
6. The Purchaser hereby agrees to waive all claims for damages which may arise out of the repossession, removal, storage, repairing, reconditioning or resale of the said property.
7. The Purchaser hereby agrees to the assignment of this contract and the Purchaser agrees that the sale, discount, pledge, hypothecation, or assignment of this agreement or any interest therein, shall not in any manner release the purchaser from his obligations hereunder, and the holder of this contract shall be entitled to all the rights of the vendor named above and the Purchaser hereby waives notice of assignment of this agreement.
8. Where this contract is executed by more than one person, covenants shall be construed and are hereby declared to be joint and several.
9. The word "property" wherever used in this contract shall include any equipment, attachments, accessories and repairs placed on the property by the purchaser.
10. Vendor shall not be liable to purchaser for failure to fill orders when such failure is due to an act of God, fire or other elements, strikes, riots, inability to obtain materials or transportation, the demand being greater than the available supply or for any other cause beyond reasonable control.
11. The covenants herein contained shall enure to the benefit of and shall bind the heirs, executors, administrators, successors and assigns of the parties hereto and any provision hereof invalid in any province shall be inoperative as to such province but without invalidating the remaining provisions hereof.
12. The Purchaser hereby acknowledges receipt of a copy of this contract and agrees that the whole agreement to be constituted on the acceptance thereof, is set forth herein; that there are no representations, warranties or conditions expressed or implied other than those herein contained, save and except the statutory warranty and guaranty in force and effect at the date of execution hereof as stipulated in "The Farm Machinery Act" R.S.A. 1942 ch. 222 as amended, "The Farm Implement Act" R.S.M. 1954 ch. 83 as amended and "The Agricultural Machinery Act 1958" R.S.S. 1958 ch. 91 as amended.

WARRANTY AND AGREEMENT

All new Products are sold upon the following warranty and agreement, which is in lieu of and excludes all other warranties and conditions expressed or implied and the Vendor neither assumes nor authorizes any person to assume for it any other liability in connection with the sale of such Products. All new unused Products are warranted to be free from defects in material or workmanship which may cause failure under normal usage and service when used for the purposes intended. In the event of failure of a part or parts and upon inspection, the Vendor is satisfied that failure is due to defective material or workmanship within six (6) calendar months from the date of delivery to the purchaser when used for farm or agricultural purposes, or within three (3) calendar months from such date when used for industrial construction or other non-agricultural purposes, such defective part or parts will be replaced by the Vendor without charge if such defective part or parts be returned to the Vendor, transportation prepaid. If the Product was not put in use until more than thirty (30) days after delivery date because of the seasonal use nature of the Product, the Warranty period shall run from the commencement date of the season of use as determined by the Vendor at its sole discretion.

It is expressly agreed that the foregoing Warranty and Agreement applies only to new, unused, products, there being no Warranty of any nature in respect of used products or such products that have been repaired, altered, neglected or used in any way which, in the Vendor's opinion, adversely affects its performance.

VENDOR'S ASSIGNMENT

The Vendor hereby assigns and transfers to Massey-Ferguson Limited, its successors or assigns all the Vendor's right, title and interest in the contract on the reverse side hereof, and all money due or owing or hereafter to become due or owing thereunder, together with all rights of the Vendor in the goods described on the reverse side hereof including all rights of seizure, removal and sale, subject to ☐ Full Recourse, ☐ Repurchase Agreement, ☐ Service Fee Plan, ☐ Dealer Reserve Account.

APPENDIX "C"

C. Repurchase of Parts by the Company

1. Once each year, as soon after October 31st as possible, the Company will repurchase stocks of slow moving or inactive parts, subject to the following conditions:

- (a) The volume of parts which the Company will repurchase is limited to six per cent (6%) by value of the net parts purchases for the year ended October 31st. However, all such parts must appear in the Company's published Parts Price List in effect on October 31.
- (b) Parts ordered on Base Stock Order will not be eligible for repurchase by the Company until after one year from the date of delivery.
- (c) The price to be paid by the Company will be Dealer Billing Price in the Company's Parts Price List in effect on October 31, reduced by fifty per cent (50%) to offset the effects of applicable Stock Order Discounts, Cash Discounts, Volume Bonuses, Price Advances, etc., and to cover handling costs by the Company.
- (d) Such parts repurchased by the Company will be shipped to it with the return freight prepaid.
- (e) The net purchase price for such parts will be applied to then due indebtedness or paid in cash at the Company's option.

APPENDIX "D"

(I)

STATEMENT PREPARED BY THE DOMINION BUREAU OF STATISTICS
FOR THE
STANDING COMMITTEE ON AGRICULTURE AND COLONIZATION
CONCERNING THE FOLLOWING:

1. Price Index Numbers of Commodities and Services used by Farmers
2. Index of Farm Machinery Prices

PRICE INDEX NUMBERS OF COMMODITIES AND SERVICES
USED BY FARMERS

Methods and Sources of Data

The Price Index of Commodities and Services Used by Farmers is designed to measure the percentage change through time in the cost of purchasing a constant or equivalent "basket" of goods and services representing the commodities and services used by Canadian farm families for purposes of operating their farms and for living. It is a "price" index and expresses current prices as a percentage of prices in 1935-1939. The "basket" of goods and services included in the index was originally based on purchases reported in a national survey of Canadian farmers in 1938 but has been modified over the years by the introduction of items which have become important in farm production and farm living since that time.

The composite price index of commodities and services used by farmers is composed of four principal groups:

- 1—Equipment and Materials
- 2—Taxes and Interest Rates
- 3—Farm Wage Rates
- 4—Farm Family Living

For each group separate indexes are produced for Eastern and Western Canada and Eastern and Western indexes are combined into all-Canada indexes for each group. Group indexes are also combined into "composite" indexes for the two regions and for all-Canada.

The items included in the "basket" of goods and services are those items used in farm family living and farm operations which can be priced and identified as to quality and quantity over time. The item coverage is extensive including items ranging in size and importance from an axe to a combine in the production component, and from a bath towel to a sewing machine in the farm family living component. In all, there are over 450 items priced.

For each item in the index there is a weight which represents its relative importance in operating and family living costs in the base period 1938. The weight of an item is a measurement of the influence that the price change of that item has on the movements of the index. The weights in the index were originally based on the national survey of 1692 farm families in 1938 but some adjustments were made to weights in 1942 and again in 1948. Weights for items of building materials, motor supply, feed, seed and hardware were obtained in a small survey of farmers in 1942. In 1948, revisions were made to items and weights within the wage, fertilizer and farm implement groups, based on wage rate surveys and surveys of distributors and manufacturers.

The prices used in the index are *retail prices*, i.e., prices that farmers actually pay for goods and services that they use. The indexes are published three times a year, viz., January, April and August, and therefore most items are priced as at the first business day of those months. Exceptions to the thrice yearly price collection are groceries, meats and stock feeds which are priced monthly, and taxes and interest rates priced annually. Wage rates are provided by surveys of crop correspondents who report to the Agriculture Division of the D.B.S., the average wages of male help quoted on a "with board" and "without board" basis. Mortgage interest rates and taxes are obtained from the same source. Farm implement and machinery prices are reported by implement manufacturers who supply a large part of the farm market. Fertilizer, seed and binder twine prices are obtained from large firms or organizations supplying these items. Prices for a large number of clothing, household equipment and sundry items are obtained from mail order catalogues. All other items not specifically mentioned above are priced at selected retail outlets serving farm communities.

In calculation of the index, the quantity of each item in the index basket is multiplied by the current price of the item and the sum of these item costs is the aggregate cost of the basket in the current period. Similarly, the aggregate cost of the basket in the base price period (1935-39) is calculated using average prices of the items in the period 1935-39. The aggregate cost in the current period is then expressed as a percentage of the aggregate cost in the base price period. The resulting percentage figure is the index. Various groups of items in the index constitute sub-baskets for each of which indexes are calculated by the method described. The indexes of these sub-groups are termed sub-indexes.

Index of Farm Machinery Prices

The index of farm machinery prices is a sub-index within the Equipment and Materials group of the Index of Commodities and Services Used by Farmers.

The index contains a selection of machinery and equipment used on Canadian farms based primarily on a survey of 1692 farms in 1938 but updated in 1948 to make the weighting pattern conform more closely to post war conditions. The items are weighted to represent the relative importance of the various kinds and types of machinery and equipment used by farmers. Over the years new machines have been added and machines that are no longer used on farms have been dropped.

The prices used in the index are dealers' list prices, F.O.B. Hamilton and Regina, for specified machines and are supplied by major farm machinery manufacturers three times a year.

The index is a "price" index and expresses current prices as a percentage of prices in 1935-1939. It is a measure of the impact of price change on the cost of purchasing a fixed quantity and quality of machinery and equipment. It is not a "cost" index and does not measure changes in costs resulting from changes in the quantities or qualities of machinery bought by Canadian farmers.

APPENDIX "D"

(II)

STATEMENT PREPARED BY THE DOMINION BUREAU OF STATISTICS
FOR THE
STANDING COMMITTEE ON AGRICULTURE AND COLONIZATION
CONCERNING THE FOLLOWING:

1. Farm Operating Expenses
2. Index Numbers of Farm Prices of Agricultural Products
3. Estimates of the Value of Farm Machinery on Farms

Operating Expenses

These outlays represent the cost to the farmers as a group of earning income from farming operations and insofar as possible, exclude those amounts which farmers paid to other farmers. These estimates represent farm operating expenses at the time they were incurred regardless of whether they were paid for in cash or accumulated as new debt. In most cases, estimates of farm operating expenses were calculated estimates, i.e. they were not the direct product of regularly conducted official surveys of farm operating expenses. In compiling farm operating expenditures, all subsidy payments were taken into account; consequently, the estimates of expenditures represent only the net amounts paid by farmers. In the cases of property taxes, interest on mortgage indebtedness, repairs and depreciation on farm buildings only those estimated amounts paid on owner-operated farms were included under these headings. The share of these expenses chargeable to rented farms, were included in the gross rent estimates.

Property Taxes—As indicated above property tax estimates cover only taxes on owner-operated farms; taxes on tenant-operated property are included in gross rent estimates. Taxation estimates were Census of Agriculture data projected according to rural-municipal taxation figures supplied by the Bank and the Public Finance Section of the Dominion Bureau of Statistics.

Gross Farm Rent—This item includes the amount paid by tenant-operators, whether cash, kind or share, for the use of farm property including farm houses and purports to cover, on behalf of the landlord, property taxes, return on investment and repairs and depreciation on buildings, including the farm home. Census of Agriculture data provide benchmarks for each of the two general classifications of rental payments, i.e. (1) cash, and (2) share and kind. Cash payment benchmarks are projected according to changes taking place in the annual estimates of the value per acre of farm land, it being assumed that cash rental payments will vary proportionally with changes taking place in farm land values. Share and kind payments are projected on the basis of annual changes taking place in the value of field crop production.

Hired Labour—This item includes the amount of cash wages paid and the value of room and board provided hired farm labour. The Census of Agriculture provides benchmarks for both wages and the value of room and board. Annual estimates of total wages are obtained by projecting the census benchmarks by means of an annual ratio of change taking place in the estimated average total wages per farm. Wage data used in calculating the change ratio of average wages per farm are obtained from farmers through the annual December livestock survey. On the schedule used, farmers are asked to report

total wages paid to hired help during the year. The Census value of board and lodging supplied to hired farm help is projected by means of indices of farm labour force and farm family living costs. Changes in labour force are currently measured by dividing the total cash wage bill by an index of wage rates. Changes occurring in total wages paid after deflation are assumed to be the result of changes taking place in the hired agricultural labour force.

Interest on Farm Indebtedness—This comprises interest paid on farm mortgages, agreements for sale and other indebtedness incurred by farmers in the promotion of the farming enterprise. The basis for farm mortgage indebtedness estimates are data provided by the Census of Agriculture. Current estimates are made up of (1) information obtained from institutions concerning their holdings of farm mortgages and (2) estimates of mortgage holdings of individuals. Institutional holdings cover holdings of such organizations as life insurance companies, loan and mortgage companies, trust companies, Government agencies such as the Dominion Farm Loan Board and the Veterans Land Act, Railways, fraternal and mutual associations, fire and other insurance companies, and municipalities. Data concerning these holdings are obtained in some cases from Public Accounts and in others from annual reports of the institutions concerned. To the total amount of institutional holdings of farm mortgages and agreements for sale were added the estimated amount of mortgages and agreements for sale held by individuals. The estimates for individual holdings were based on Census of Agriculture data adjusted according to the yearly changes occurring in institutional holdings. These intercensal estimates were prepared for Canada as a whole and then broken down by provinces. This breakdown was effected by determining from the Census of Agriculture the relationship of provincial farm indebtedness to total farm indebtedness and applying these percentage relationships to the above all-Canada estimates.

In addition to the above indebtedness estimates, an allowance is made for other interest-bearing farm business debts, such as those incurred for the purchase of machinery, livestock and farm improvements. These estimates are based on data concerning transactions under the terms of the Farm Improvement Loans Act and from information concerning bank loans to farmers as reported by the Bank of Canada.

Interest rates, applied to total indebtedness estimates are obtained from farm correspondents by means of an annual mail-questionnaire survey.

Feed and Seed—This item of farm operating expense includes only feed and seed purchased through commercial channels. It excludes direct interfarm transfers of grains, but includes those grains which are shipped from the Prairie Provinces to eastern Canada and British Columbia and those grains sold to country elevators and later repurchased by western farmers for feed and for seed. The items considered were wheat, oats, barley, rye, manufactured livestock and poultry feeds, millfeeds, chopped grain feed, custom chopping or grinding, high-protein feeds fed direct to livestock, and seeds such as turnip seed, sugar beet seed and hybrid corn seed.

Basic information regarding the quantities of Prairie feed grains moved into the Maritime provinces, Quebec, Ontario and British Columbia for livestock feeding is obtained from reports setting forth feed grain shipments under the provisions of the Federal Freight Assistance policy. Not all grains moved under this scheme are purchased direct by farmers: large amounts are acquired by manufacturers of livestock feed. It is assumed that the total quantity of each of wheat, oats, barley and screenings used by the feeds industry is obtained under the provisions of the freight assistance policy except those quantities used by manufacturers located in each of the three Prairie Provinces. The quantities used by the Feeds industry are adjusted to remove the quantities used by that part of the industry located in Manitoba, Saskatchewan and

Alberta. The adjusted quantity is then deducted from total freight assistance shipments and the residual is assumed to be the amounts of these grains purchased direct by farmers. These direct purchases are valued by means of dealer feed prices collected by the Prices Division of the Bureau of Statistics.

The quantities of whole grains purchased by western farmers for feed and seed are obtained from the Statistics Branch of the Board of Grain Commissioners in Winnipeg. These quantities are valued at the domestic prices at the Lake head less cost of transportation between country points and the terminal elevators, and less terminal handling charges.

The value of manufactured livestock and poultry feeds is obtained from Bureau reports dealing with the Feeds industry. These value figures are adjusted to take care of concentrates produced and used within the industry for the production of secondary feeds. The adjusted data are assumed to represent the quantities purchased by farmers. The report of this industry also covers farmers' expenditures for those whole grains which are purchased by the Feeds industry and chopped or ground before sale to farmers.

Expenditures for custom chopping or grinding represent costs incurred by farmers at the time they have their own supplies of grain chopped or ground at mills providing this type of service. This information is also presented in the report on the Feeds industry.

Farmers' expenditures for millfeeds (bran, shorts and middlings) are based on information obtained from the Bureau report on the Flour Milling industry. This report presents the total amount of millfeeds produced. To this amount is added the quantities imported to obtain total supplies available for disposition. From these total supplies are deducted the quantities exported and the quantities consumed by industries producing breakfast foods and prepared livestock feeds. The amount remaining after these deductions is assumed to be the quantity purchased by farmers for direct feeding to livestock. This residual quantity, expressed in tons, is valued at the per unit value for production at the flour mills, plus 10 per cent for retail mark-up.

Estimated quantities of high-protein feeds fed directly to livestock by farmers are obtained by subtracting from total apparent domestic disappearance of these feeds the amounts used by the Prepared Stock and Poultry Feeds industry. The apparent domestic disappearance of high-protein feeds is prepared by the Crop Section of the Agriculture Division and is calculated by determining the production of the various high-protein feed items and making allowance for imports and exports. Most of the prices are obtained from farm magazines.

Farmers' outlay for sugar beet and turnip seed are calculated by determining first the amount required as indicated by the acreage grown and the seeding rate per acre for each of these two crops. The price per pound of turnip seed is obtained from seed houses and the price per pound of sugar beet is obtained from sugar beet companies. Farmers' outlay for hybrid corn seed is calculated by using corn crop acreages and information supplied by the Central Experimental Farm. The Farm provided some indication of the proportion of the acreages of fodder corn and shelled corn planted with hybrid corn seed. To these acreages is applied a seeding rate per acre to obtain total seed requirements. Approximate prices per bushel were also supplied by the Farm.

Tractor Operating Expenses—The first step in calculating tractor operating expenses is the computation of the number of tractors on farms each year. This is accomplished by using the numbers reported by the Census of Agriculture as a basing point and projecting them year by year by means of an allowance each year for the numbers purchased by farmers and the numbers discarded. Farm purchases are obtained from the Bureau's annual report

on Farm Implement and Equipment Sales. The discard rate is based on the discard experience of the previous intercensal period.

The next step is the determination of the average size tractor in use by area, the number of hours worked per year and the fuel consumption per hour. On the basis of information gleaned from United States and Canadian publications on the subject and discussions with the staff of the Engineering Division of the Central Experimental Farm, it was decided that for eastern Canada and British Columbia the most representative tractor was the 2-3 plow size. It was further assumed that throughout the year the average working load for these tractors was a medium load and that under these conditions the fuel consumption would be about 1.2 gallons per hour. The total number of hours of tractor use in these areas varied between 400 and 600 hours per year according to a sample survey of selected farm operating expenses carried out in 1952.

A 3-4 plow tractor was assumed to be the most representative size tractor in the Prairie Provinces. According to the Central Experimental Farm such a tractor under heavy load conditions would consume 1.8 gallons of fuel per hour. It was estimated that Prairie tractors would operate about 900 hours per year. It is assumed that all fuel used was gasoline, since there is little available information regarding the quantities of the other fuels used such as diesel fuel, distillate and kerosene.

Price per gallon for gasoline was obtained from the labour and Prices Division, D.B.S. Allowance was made for tax exemptions and refunds when used for farm purposes. Provincial tax per gallon was obtained from the Motor Vehicle report published by the Transportation Division, D.B.S.

Consumption of lubricating oil by tractors was related to the consumption of gasoline, the consumption ratio being 1 gallon of oil to approximately 40 gallons of gasoline. Oil price data was also obtained from the Labour and Prices Division, D.B.S. The cost of labour spent exclusively on repairs to tractors was expressed as a percentage of total outlay for gasoline and oil. This percentage, between 20 and 25 per cent, was based upon information obtained from the above-mentioned 1952 sample survey of selected farm operating expenses. No allowance is made for repair parts as they are included with expenses item, Machinery Repair Parts. Allowance for depreciation on tractors is included in the estimate of total depreciation on all farm machinery.

Combines—This item of expenditure covers only farmers' outlay for gasoline and oil required to operate these machines. No allowance is made for repair parts since they are included with the expense item, Machinery Repair Parts. Allowance for depreciation is included in the estimate of total depreciation on all farm machinery.

Farmers' outlay for this item is calculated by multiplying the estimated number of acres combined by average consumption of gasoline and oil per acre. Consumption of fuel and oil are based on information from farm management surveys. Prices of both gasoline and oil are the same as those used to calculate gas and oil expenses for tractors.

Trucks—The annual estimates of the number of trucks on farms for the intercensal years is based on the census count of farm trucks in the census years and the total annual provincial registration of all trucks as reported by the Transportation Section, D.B.S. The relationship between farm trucks and total truck registrations is determined for the census years and applied to the annual registration of all trucks during the intercensal periods.

Mileage operated per year and miles per gallon of gasoline were estimated on a per truck basis from information obtained from the 1952 sample survey of selected farm operating expenses. Annual mileage per truck varied between 4,000 and 5,000 miles and the mileage per gallon of gasoline was estimated at

about 13 miles per gallon. Oil consumption was at the rate of one gallon of oil per 30 gallons of gasoline. Both oil and gasoline prices (including tax) were obtained from the Prices Division of the Bureau. The outlay for grease was estimated at about 25 per cent of that for oil.

The calculation of farmers' annual outlay for truck tires and tubes involved the determination of an annual replacement factor, the average tire size used and the relevant prices. A replacement factor for farm truck tires and tubes was estimated after reviewing data from the 1952 sample survey of selected farm operating expenses and the results of a survey conducted by the United States Department of Agriculture and published in "Farm Expenditures for Operating Automobiles, Motor Trucks and Tractors." Data concerning average sizes were obtained from tire manufacturers and prices from the Bureau's Prices Division.

Repairs and insurance were expressed as a percentage of total outlay for gasoline, oil, grease, tires and tubes. This relationship was determined from information obtained from the 1952 Farm Expenditure Survey, the United States publication mentioned immediately above and from Canadian Farm Management surveys.

License fees were estimated from the 1952 Farm Expenditure Survey.

Automobiles—The calculation of operating expenses for farm automobiles was similar to that outlined above for trucks. However, in the case of automobiles only one-half of these expenses was assumed to have been incurred for farm business.

Blacksmithing and Machine Shop Charges—Data from a farm management survey conducted some years ago in Saskatchewan indicated the average charge for blacksmithing and machine shop services on various types of farm classified according to size. These charges were assumed to be the same for each farm size classification in each province. Using these charges and the number of farms in each size classification according to the 1941 Census of Agriculture, the total expense for this item for each province was obtained for 1940. The 1940 estimate is projected by means of an index of farm machinery repair part costs.

Binder and Baler Twine—Farmers' outlays for binder and baler twine are based on the estimate of the domestic disappearance of binder twine derived from the Bureau's annual report on the Cordage, Rope and Twine Industry. Wholesale prices for these twines are obtained from the Prices Division and marked up to retail selling levels.

Fertilizers—This estimate covers farmers' outlays for commercial fertilizers. The quantities of fertilizer material and mixed fertilizers sold annually in each province are obtained by an annual census of the fertilizer industry conducted by the Bureau of Statistics. Prices to farmers of the various fertilizer materials and mixes are obtained through correspondence with about 20 of the larger fertilizer companies.

Agriculture limestone—This represents farmers' outlay for agricultural limestone used for soil amendment purposes. Quantities purchased and net prices to farmers after allowance for government subsidies is obtained through correspondence with provincial departments of agriculture.

Pesticides—This estimate includes herbicides, insecticides and fungicides and is based on data contained in the Bureau report on the Sale of Pest Control Products by Canadian Registrants. These sales reported in terms of wholesale price are marked up to retail selling price levels.

Containers—Farmers, expenditures for containers are prepared by projecting Census benchmark according to annual estimates of the value of products produced by the Cooperage Industry and the Box, Basket and Crate Industry.

Nursery Stock—It was assumed that the farm purchase of nursery stock was equivalent to the annual value of nursery stock sales as obtained by the D.B.S. annual survey of nurserymen.

Fencing—Estimates for this farm expenditure are based on information contained in the Bureau publication. "The Wire and Wire Goods Industry" and on import and export statistics. The estimate of farm fencing expenditure is assumed to equal production plus imports minus exports of barbed wire, woven wire farm fence, woven wire poultry netting, steel fence posts and wire staples. The acceptance of these figures as the equivalent of farmers' outlay for fencing disregards any changes taking place in manufacturers' and dealers' inventories and purchases of items by non-farm users. The value of consumption of farm fencing materials obtained in this manner was increased by $33\frac{1}{2}$ per cent to make allowance for retail mark-up and to the resulting figure, an additional 10 per cent was added to allow for the purchase of wooden fence posts.

Machinery Repair Parts—Current data concerning the cost of farm machinery repair parts are obtained from the annual D.B.S. report, "Sales of Farm Implements and Equipment in Canada." Statistics contained in this report are obtained by means of a complete annual census of the farm machinery industry and cover, in addition to the value of implement and equipment sales, the sales value of machinery repair parts. Since these value of sales data are, for the most part, wholesale prices, they are increased by approximately 31 per cent to take care of retail mark-up. This approximate retail mark-up percentage was obtained from one of the leading Canadian farm implement journals.

Repairs to Farm Buildings—Estimates of farmers' expenditures for farm building repairs are supplied by the Economic Branch of the Department of Trade and Commerce. These estimates are based on census data concerning farm purchases of building materials for repairs to farm property. It is assumed that this represents 75 per cent of the costs of building repairs, the other 25 per cent being labour costs. The estimated value for the base year is projected for each province on the basis of the combined index of the retail sales of building materials and farm cash income. Arbitrary adjustments are made to these estimates in those years in which sharp upward or downward movements occur.

Irrigation charges—This item covers expenses incurred by farmers associated with large irrigation projects and is estimated only for the provinces of Alberta and British Columbia. It does not include any specific estimate of costs to farmers for the operation of private irrigation systems.

Data necessary for these estimates are obtained from the Alberta Department of Water Resources and the British Columbia Department of Lands and Forests.

Electric Power—The source of information for this estimate is the Bureau's annual report concerning Central Electric Stations. The report sets forth the annual average electric bill per farm. This figure is applied to the number of farmers serviced with electric power from central power stations and the resultant estimates adjusted to include any federal or provincial taxes payable thereon. The number of farms involved is obtained from the Census of Agriculture and projected according to the change in the number of customers included in the farm service sector and also set forth in the report on Central Electric Stations, since the farm service sector includes some customers who are not farmers this information can not be used directly as a measure of the number of farms using electricity. It is assumed that only one-half of

this total expense is chargeable to the farm business. No allowance is made for expenditures by farmers for the operation of their own electrical plants.

Artificial Insemination of Cattle—Information on fees charged per animal and the number of animals serviced is obtained from the Federal Department of Agriculture and the Livestock Commissioner for Ontario.

Breed Association Fees—This expenditure covers fees for memberships, registrations and transfers associated with the production of purebred livestock. This information is obtained from the annual reports concerning the Canadian National Livestock Records and the Holstein-Friesian Association.

Purchases of Feeder Cattle—This item includes only expenditures by Ontario farmers for western feeder cattle and calves. Data required for these statistics are obtained from the Marketing Service of the Department of Agriculture.

Miscellaneous Farm Expenses—This item is intended to cover such farm expenses as veterinary services, rope, salt, small tools, hardware and harness repairs. The total of the above operating expenses is increased by approximately 5 per cent to take care of these outlays.

Depreciation Charges

Depreciation is a charge against farming operations for the use of farm buildings, including the farm houses, and machinery acquired for the promotion of the farm business; this charge is made annually over the estimated useful life of the asset and is in proportion to the number of years it is expected to be in use. The item was intended to cover that part of depreciation and obsolescence which cannot be offset by repairs.

Buildings—This item covers only depreciation on farm buildings, including farm houses, on owner-operated farms: the charge for building depreciation on tenant-operated farms is included in the estimate of gross farm rent. The amount of depreciation was calculated on the basis of a 4 per cent rate charged against the estimated annual inventory value of farm buildings. The annual estimates of the value of farm buildings were Census of Agriculture data projected by means of official annual statistics of the value per acre of farm land, including buildings.

Machinery—The rates of machinery depreciation were those used in the Report of the Royal Commission on the Dominion-Provincial Relations, 1939. They were 7 per cent for eastern Canada and British Columbia and 11 per cent for the Prairie Provinces. Annual inventory values of farm machines to which these depreciation rates are applied, are calculated from Census of Agriculture data adjusted intercensally by annual allowances for depreciation and retail value of new sales.

Index Numbers of Farm Prices of Agricultural Products

The Index of Farm Prices of Agricultural Products was designed to measure monthly changes taking place in the prices farmers realize at the farm level from the sale of farm products. As will be shown later, the farm index is not a measure of pure price change but rather an indicator of price change occurring as a result of variation in the prices received and/or the quality of products sold.

Most of the price data used in the construction of the index are obtained by means of a monthly mail-questionnaire survey of about 6,000 farmers situated all across Canada: between 50 and 60 per cent of these farmers fill in and return these schedules as of the 15th of each month. Prices required for the index and not collected by means of this survey, are obtained from

provincial departments of agriculture or from the processors of the agricultural products concerned. A list of the commodities included in the index, the weights which have been assigned to them and their source are included in a table appended to this statement.

The farmers, in filling out the questionnaires associated with the above-mentioned survey, are requested to report the average prices prevailing in their neighbourhood, taking into account the various grades of each commodity marketed. If they are unable to report for their neighbourhood, they are asked to report prices received for their own produce. As indicated, the price required for each commodity is an average price which reflects all grades marketed. This points up the fact that changes occurring in average farm prices from month to month are not always pure price changes. It is conceivable that the prices for particular grades of farm produce may remain unchanged from one month to the next, yet the average prices reported by farmers may move up or down as the quality of products marketed moves up or down. Therefore, changes occurring in average farm prices as reported to the Bureau may reflect changes in price, changes in quality marketed, or a combination of both. These prices are prices which, when applied to total farm sales, will provide an estimate of total cash income from the sale of farm products.

With respect to the prices used in the index, the present system of marketing wheat and coarse grains in the Prairie Provinces of Canada creates some difficulties. Most of farmers' deliveries of these grains in this area must be made to the Canadian Wheat Board. At the time of delivery, the western producer is given an initial payment and a certificate covering quantities and grades delivered. These certificates entitle producers to share in any surpluses accumulated by the Board through sale of these grains. Since considerable time may elapse between receipt and sale of this grain by the Board and since total surplus accruing to a certain crop cannot be calculated until the crop has been sold by the Board, distribution of these surpluses in the form of participation payments does not take place for several months after delivery by the farmer. Consequently, the western grain prices first used in the construction of the current index are initial prices only. If and when participation payments on current deliveries are made at a later date, they are added to the current initial payments and the index revised upwards accordingly, as has been done in past years. Meanwhile the current index based on initial grain prices is not comparable with the index for earlier months which is based on initial prices plus participation payments. To solve this problem, in part at least, there is included in the monthly publication, *Index Numbers of Farm Prices of Agricultural Products*, a table setting forth the effect on the index of a ten-cent payment per bushel for each of the three grains, wheat, oats and barley. Thus, anyone who wishes to hazard a guess as to how much the final payments are likely to be, may adjust the index so that it will be approximately comparable with the earlier years.

The base period currently used in the construction of the farm price index is the five-year period 1935-1939. This base was chosen to agree with the bases which were then being used for all other Bureau indexes and thus promote direct comparability between indexes. Prior to the selection of 1935-1939, the year 1926 served as the official base for Bureau indexes and it was considered to be fairly satisfactory. An attempt is made to provide for periodic rebasing of Bureau indexes and at the present time plans are being made to place the farm price index on a more up-to-date base. In the meantime this index is constructed in such a way that it may be shifted at will by users to any reference base desired without seriously affecting the validity of comparisons resulting from this mechanical adjustment.

Commodities included in index numbers of farm prices of agricultural products, associated weights, and source of price information.

<i>Commodity</i>	<i>Weight</i>	<i>Source of Price Information</i>
Wheat	30.8	Monthly farm price survey
Oats	2.4	" " " "
Barley	2.1	" " " "
Flax2	" " " "
Corn4	" " " "
Cattle	10.8	Monthly farm price survey
Calves	2.5	" " " "

Potatoes	3.7	Monthly farm price survey
Fruits	3.0	Provincial governments
Vegetables	1.5	Provincial governments and processors
Sugar beets2	Sugar beet processors
Maple products3	Purchasers of Maple Products
Flue-cured tobacco	2.1	Marketing board
Fur farming1	Bureau Survey of Fur Farmers
	100.0	

Estimates of the Value of Farm Machinery

Estimates of the value of machinery on farms are based on values reported by farmers each time a Census of Agriculture is taken. For the year immediately succeeding a census year, the estimate is prepared by applying the over-all farm machinery depreciation rate (7 per cent in eastern Canada and British Columbia and 11 per cent in the Prairie Provinces) to the total value of farm machinery as reported by census and adding the current sales of new farm machinery. Estimates for each succeeding year are derived by applying the above depreciation rates to the estimated total value of farm machinery for the previous year and adding the current sales of new farm machinery.

Estimates are prepared at the aggregate level only. No attempt is made to prepare them by type of machine. The depreciation rates were those prepared for the Report of the Royal Commission on Dominion-Provincial Relations, 1939. Estimates of the annual value of sales of farm machinery are obtained by means of the Bureau's annual survey of the farm machinery industry; these data are set forth in the Bureau report, *Farm Implement and Equipment Sales*. Since the value of these sales is reported at wholesale levels, a mark-up of approximately 22 per cent is applied to it to bring it to the retail level.

These estimates are prepared year by year until the total value of farm machinery becomes available for the succeeding Census year. If necessary, the annual intercensal estimates are adjusted to bring them into line with the new census benchmark.

APPENDIX D

III

STATEMENT PREPARED BY THE DOMINION BUREAU OF STATISTICS
FOR THE
STANDING COMMITTEE ON AGRICULTURE AND COLONIZATION
CONCERNING THE FOLLOWING:

Farm Implement and Equipment Sales

Statistics on farm machinery in Canada are available in several forms. First, there has been some detail as to machines on farms since 1870 from Censuses of Agriculture. Since 1917, there has been an annual survey of manufacturing in this industry. These series have and will be continued. Neither, however, meet some of the major requirements of the firms in the industry. Their interest, in addition to how many machines are on farms and how many are produced each year in Canada, lies in the current market—i.e., how many were sold this year compared to last and what per cent of that market did they get. Since the market absorbs a considerable amount of imported lines and since neither Canadian production nor imports as recorded in import statistics reveal actual sales, it was very important to the industry that a "sales" series be compiled. This resulted in a new survey of sales, first undertaken on an annual basis for the year 1936. Since this was a "sales" series, although manufacturers as well as importers were surveyed, it was placed with the Merchandising Section.

The Annual Survey

The most difficult problem with this survey lies in maintaining a complete list to ensure adequate coverage. Attempts are made to keep the coverage as complete as possible without doing an actual commodity survey which would cover many industries not classified to farm implements. Initially, all Canadian manufacturers classified to the industry and all importers of farm implements and equipment were surveyed. The manufacturing part of the list is maintained by reference to the Census of Industry. For many years, the importers' list was checked by tallying import customs slips one month in the year; this was done by the staff of the External Trade Section. Since 1952, however, this service has been suspended and trade magazine directories and advertisements in monthly issues are used as a source of new firms. In January 1959, a letter was sent to 85 American manufacturers of major lines, asking for a list of their Canadian distributors. This source, with a continual search of trade magazines, should "catch" all importers of any real importance. Most of the very large U.S.A. manufacturers have Canadian companies from whom consolidated reports can be obtained.

In this survey, we are attempting to cover only those firms whose business is that of selling implements in Canada. A survey of all dealers, to measure actual sales at the customer level, can only be done at the time of the decennial census. By surveying manufacturers and importers, quite reliable statistics are compiled with the minimum effort of contacting less than 200 firms. Given good coverage at these two levels, the main problem is to avoid duplication. This occurs in two ways as follows:

1. A few Canadian manufacturers make machines and report them as instructed. Half of their production, however, can be for one of the main-line firms on a contract basis. These machines have always been reported by the main-line company since they were made to their specifications and painted their colour and trade mark and

were sold along with all of their own machines. These goods, until 1958, were duplicated. The main-line companies are now asked to inform D.B.S. of these contract-manufacturers. Since better information on a provincial breakdown and on sales to user is available from the large company, we now ask the smaller manufacturer to exclude sales made to the main-line company under these circumstances. Instructions have always been to report only sales of own manufacturer or direct import, not to include goods made by another Canadian manufacturer; these few cases are exceptions to this general rule.

2. Importers are often distributors of Canadian goods as well as being sole distributors for foreign lines. Up to 1952, many importers reported total sales regardless of instructions. In that year, a form was sent to all importers asking for the names and addresses of suppliers and machines of each. This resulted in elimination of \$12 million duplication. A distributor would handle Massey-Ferguson products as well as importing U.S.A. dairy equipment. His Massey-Ferguson sales reported by him were also reported by Massey-Ferguson. Such a form is sent to import-distributors periodically to ensure the exclusion of Canadian-made goods from their reports.

The Survey on Farm Implement and Equipment Sales, then, is one of Canadian manufacturers and importers. These firms are asked to report sales to user (in unit count) to which is applied a "wholesale" price. The large manufacturers receive statements of unit sales to farmers from their retail dealers and prefer to apply a dealer's cost price to them rather than let the dealer apply a value that may or may not include a trade-in allowance, an unauthorized discount, etc.

APPENDIX D

V

STATEMENT PREPARED BY THE ECONOMICS DIVISION,
CANADA DEPARTMENT OF AGRICULTURE
FOR THE
STANDING COMMITTEE ON AGRICULTURE AND COLONIZATION
CONCERNING THE FOLLOWING

Freight Rates on Agricultural Implements From Toronto to Selected Points in Western Canada and the Maritimes. These data show for the period 1949 to date the freight rates for the category of the main items of farm implements. Rates on other items which are excepted from this general class are also shown in the attached schedule.

*Implements, Agricultural,
Other than Hand, with Exceptions¹
Railway Freight Rates, 1950 to date*

From: Toronto

To: Edmonton, Regina, Winnipeg and Truro

Destination: Edmonton Regina Winnipeg Truro
(cents per 100 lb.)

Effective Date	6th Class ²			
11 Oct. 1949	234	179	132	
23 Mar. 1950	252	193	142

Implements, Agricultural, other than Hand

^aSource: CFA. CTC. 1534, class 40, and item 200 of CFA. CTC. 1515.
Minimum weight varies, with implement, from 18,000 lb., in open car not over 41 ft. 8 in. long, to 24,000 lb.

^bSource: CFA. CTC. 1576, class 40 and item 170 of CNR. CTC. E. 4060.
Minimum weights as for "^{cn}".

¹All 6th class or class 40 rates shown have applied continuously on all principal items of farm machinery, other than those specified under "Exceptions" below. These principal items include tractors and combines in addition to the more general item for implements not otherwise indexed by name (noibn), "agricultural implements, other than hand, noibn, K.D. in packages, or S.U."

Exceptions: Implements Requiring Higher than Class 40 or 6th Class Rates Now or Previously.

1. Those requiring higher rates now.

(a) Those listed in CFC 20 (Canadian Freight Classification No. 20), under "Agricultural implements other than hand" with a higher classification rating than class 40:

(1) Those subject continuously since 1950 to said higher rates:
Feeders to threshers; straw stackers for threshers; one or two-

wheeled trucks or binders' trucks; and agricultural implements in mixed carloads with iron or steel chain, belting or sprocket.

- (2) Those becoming subject to said higher rates 1 March 1955 or later (year of effectiveness of increased rate in brackets): Beet pullers (1955); crop driers (1957); pea viners (1959); rakes, S.U. (1961); rock pickers (1958); soyabean harvesters and threshers, combined (1958); stackers, other than for threshers or separators (1958); and, probably (if "farm carts" includes "beet harvester carts") for eastbound shipments only, beet harvester carts, S.U. (1955).
- (b) The following are listed in C.F.C. 20, but not under "agricultural implements, other than hand" and are subject to higher rates for eastbound shipments only: cream separators; feed conveyors; field or orchard sprayers; windmills; and windmill towers.
2. Those requiring higher rates previously but taking class 40 rates now.
 - (a) Those of which the rates were changed to class 40 by CFC 20. Traction engines and potato diggers were subject to 5th class rate from 8 Nov. 1950, or earlier for engines, to 28 Feb. 1955. CFC 20 changed the rate of class 40 effective 1 March 1955.
 - (b) Changed to class 40 by commodity items. Hay press and windrow pickup, combined, effective as follows: (1) For westbound shipments, 5th class November 1953 to 27 June 1954 and 6th class or class 40 thereafter. (2) For eastbound shipments, 5th class or class 45 from November 1953 to 10 February 1957 and class 40 thereafter. Also, for westbound shipments only, changed to class 40 (effective year in brackets): Feed conveyors, K.D. (1960). The commodity items referred to are item 200 of CFA. CTC. 1515, preceded by item 145 of CFA. CTC. 1292, and item 170 of CNR. CTC. E. 4060.

Other Implements

Those entitled to continuing class 40 rate only through commodity items.

Through the commodity items identified in paragraph 2(b) above, and effective 28 April 1958, many implements were authorized to receive continued application of the preceding class 40 rate that would otherwise have been increased effective 29 April 1958, to class 45 rate when these implements were specifically added to CFC 20, and were thereupon individually assigned class 45 ratings, rather than being subject to class 40 under the general item "agricultural implements, other than hand, noibn, K.D. in packages or S.U."

²Source CFA. CTC. 1164, 6th class and CFA No. 5 series either CTC. 1292, item 145 or CTC. 1515, item 200. Minimum weights varied with implements as follows: From 24 July 1950 to 29 October 1952, from 20,000 lb. to 24,000 lb., or for multicar shipments 17,500 lb. and up. From 30 October 1952 to 28 February 1955, same as for "a" above.

APPENDIX "E"

This insert is being included with our Brief because we feel it provides valuable condensed information by a capable, experienced and well qualified person. Mr. W. C. Cockshutt who for one year was a member of our staff, employed to teach Business Management to Farm Equipment Dealers prepared this data from long hours of research through publications, articles, studies and so on all having to do with Farm Equipment Retailing.

1.—*Overallowances and Discounts.* The attached pages give more information regarding this item but basically the customer is *normally* given a considerable reduction in price. It varies from 5% to 20% and will average out between 8% and 10%. His original margin then, or spread between factory invoice and retail price, is reduced from 20% to 12%. A large amount of emphasis should be used to show that this 8% to 10% is always passed on as a saving to the customer.

2.—*Selling Costs.* The farm equipment retailer has greater selling costs than almost any other retailer because he must "beat the bushes" and search for his prospects and deals. This is partly due to the nature of the farmer because he is more likely to make a large purchase while on his own premises. It is also necessary for the seller to appraise the used machine and it is only possible to do this on the farm. A comparison here can be drawn between farm equipment and appliances, groceries, clothes, cars, etc., which can be sold to walk-in trade, off the shelf. This situation generally eats up about 7% of the retail price which lowers the operating profit to 5% (12%-7%).

3.—*Warranty.* In most industries the manufacturer bears the brunt of warranty, and even if the retailer does the actual work, he is reimbursed in full. This is not so with farm equipment. The dealer must keep his customer satisfied and does the public relations job for the manufacturer. When costs are involved he is only credited with the actual parts and in some cases about 50% of the labour costs. 50% on labour will not cover his cost and even this small amount of credit is only granted on larger items such as tractors, combines and balers. He must bear 100% of the costs in respect to all small machines and used equipment. This generally lowers his operating profit a further 2% with a net result that his realized net will be about 3% (5%-2%).

In general the dealer has little influence over these three items mainly because the customer expects it of him, and he will lack volume if he does not satisfy the farmer. Many other items eat into his profit, the largest of which is probably the loss normally experienced in operating his shop. The nature of the work requires a shop and the thriftiness of the customer dictates the rate he may charge. He is then caught in the squeeze between cost and sale price over which a small operator has little control.

The attached outline and calculations may back up and explain the above statements and are the *considered opinions* of the writer.

SUMMARY

New Equipment Sales

Original Dealer Margin		20%
Overallowances	8%	
Selling Expenses	7%	
Warranty Costs	2%	
	17%	17%
NET PROFIT		3%

Total Dealership Sales

Gross Margin All Departments	16%
Total Expenses	15%
Operating Profit	1%
Other Income	2.7%
NET PROFIT	3.7%

NOTE: Net Profit is before Income Taxes.

INFORMATION ON CANADIAN FARM EQUIPMENT DEALERS

Estimated Average Sales Breakdown

Farm Equipment Dealers have sales volumes varying from less than \$25,000.00 per year to about \$600,000.00 per year. The average, however, will be somewhere around \$100,000.00. These figures are based on total retail sales, calculated by the automotive type of accounting in which a sale is shown at the full retail value rather than the cash difference or Net Sales system.

i.e. New Unit	4000	
Cash	2000	
		6000
Trade	2000	
Trade Sale	2000	

Total sale is \$4000 plus \$2000 = \$6000.00

The following breakdown is representative of normal pattern. Any major line handled such as cars, wholesale distribution, gas and oil, farm bulk gasoline sales etc. are *not* included.

Retail Sales Breakdown

New Equipment	\$ 55,000.00
Used Equipment	15,000.00
Parts	10,000.00
Service Labour	10,000.00
Misc. Sales	10,000.00
	<u>\$100,000.00</u>

Gross Margins

All companies have varying contracts, discounts and purchase agreements, but most of them fall within the following list:

	Original Discount	Extra Discount
New Machines	20%	4%
Parts	27%	5%

Operating Margins

Using the above discount schedule for calculations we shall apply the average costs and deductions which appear to average as shown. Many dealers will show better operating margins, but the majority, fall below these.

New Equipment

Original Gross Margin	20%
Overallowances to Customers	8%
Operating Margin	12%
Selling Expenses	7%
Net Profit	5%

The major item here is "overallowances to customers" which vary from zero to as much as 20%. In almost every instance the customer can get a minimum of 10% discount for cash. The selling expenses shown do not include any allowance for reconditioning.

Used Equipment

There is actually no gross margin available here as it is generally found that a trade is sold at the allowed price, less the overallowance shown under new equipment. This then means that Operating Profit is zero. Selling Expenses involved are 7% and would include reconditioning. This then is a loss of 7% for the used equipment operating. Since Sales of Used *in dollars* is about 27% of New, then the loss would be 27% of 7% or 1.89%.

Net Loss 1.89% of Total Sales

Parts Department

The Parts Department operates at a larger original margin (27%), but at the average dealership the Net is small because of the parts man's wages where volume is low. At an annual sales volume of \$10,000.00 the margin available would provide only \$2700 for the parts man's wages.

Net Profit 0%

Service Shop

Most shops in small dealerships are kept merely to provide the necessary labour force to carry on the Sales of New and Used Equipment. The larger the shop the greater percentage of available hours will be devoted to actual customer work. This is the only work on which they can attempt to make a profit and in many cases they do not charge sufficient to make a reasonable profit after all expenses are met.

The average shop then normally shows a considerable loss on its operations. This loss will probably approach 20% of labour sales or an amount equal to about 2% on total sales—all departments.

Net Loss 2% of Total Sales

Other Income

Since most companies give some extra discounts, sales allowances, volume bonuses, etc. this other income is a credit to the total operation.

5% cash discount on parts

4% bonus or special allowance on New Equipment

These figures when applied to the Total Sales of all departments will be as follows:

Parts 10% of 5%5%
New Equipment 55% of 4%	2.2%
	<hr/>
Total	2.7%

Total Net Profit

New Equipment	5.0 %
Used Equipment	—1.89%
	<hr/>
New and Used	3.11%
Parts Dept.	0. %
Service Shop	—2.0 %
Other Income	2.7 %
	<hr/>
Total Net Profit	3.81%

NOTE: This Net Profit is before Income Tax is deducted.

ORDER OF REFERENCE

TUESDAY, May 9, 1961.

Ordered,—That the name of Mr. Mandziuk be substituted for that of Mr. Smith (Lincoln) on the Standing Committee on Agriculture and Colonization.

Attest

LÉON-J. RAYMOND
Clerk of the House.

MINUTES OF PROCEEDINGS

FRIDAY, May 12, 1961.

(15)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Badanai, Belzile, Campbell (*Lambton-Kent*), Clermont, Cooper, Doucett, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), Korchinski, McBain, McIntosh, Mandziuk, Montgomery, Muir (*Lisgar*), Noble, Pascoe, Rapp, Régnier, Ricard, Smallwood, Tardif, Thomas, Thompson, Tucker, Villeneuve and Webb—29.

In attendance: From *International Harvester Company of Canada, Limited:* Messrs. O. G. Voss, President; C. C. Brannan, Vice-President; W. B. Gay, Vice-President and Comptroller; W. E. Jolley, Secretary and E. L. Edmonds, Assistant Secretary.

The Chairman introduced Mr. Voss who, in turn, introduced the officials of International Harvester Company of Canada, Limited. On behalf of his company, Mr. Voss presented their brief regarding farm machinery prices.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING

(16)

The Committee reconvened at 2.35 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Badanai, Belzile, Campbell (*Lambton-Kent*), Clermont, Cooper, Danforth, Doucett, Fane, Forbes, Gundlock, Henderson, Hicks, Korchinski, McBain, McIntosh, Mandziuk, Montgomery, Muir (*Lisgar*), Pascoe, Rapp, Régnier, Ricard, Rogers, Smallwood, Tardif, Thomas, Thompson and Villeneuve—28.

In attendance: Same as at morning sitting.

Mr. Voss continued the presentation of the International Harvester Company of Canada, Limited brief.

Mr. Danforth moved, seconded by Mr. Montgomery,

Resolved,—That the Committee print 1,000 copies in English and 350 copies in French of this day's Minutes of Proceedings and Evidence.

Agreed,—That Cost Analysis Comparison by Years of International Harvester Company of Canada, Limited, Hamilton Farm Equipment Works be made an appendix to this day's Minutes of Proceedings and Evidence. (See appendix "A")

The Committee questioned the officials of the International Harvester Company of Canada, Limited on their brief.

The Chairman thanked the officials of International Harvester Company of Canada, Limited for their appearance.

At 6.00 p.m. the Committee adjourned until Monday, May 15, at 9.30 a.m.

Clyde Lyons,

Clerk of the Committee.

MONDAY, May 15, 1961.

(17)

The Standing Committee on Agriculture and Colonization met *in camera* at 9.35 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Argue, Badanai, Clermont, Doucett, Fane, Forbes, Henderson, Hicks, Horner (*Acadia*), Horner (*Jasper-Edson*), McBain, Mandziuk, Montgomery, Muir (*Lisgar*), Pascoe, Peters, Rapp, Regnier, Rogers, Smallwood, Southam, Stefanson, Tucker, Webb—(24).

Agreed,—To further consider invitation of Massey-Ferguson Limited to have Committee visit Toronto plant.

Agreed,—Not to schedule an appearance of Saskatchewan Implements Limited at this time but to ask for copies of their brief.

Agreed,—On the format of the letter to companies manufacturing farm machinery for sale in Canada.

At 10.40 a.m. the Committee adjourned until Friday, May 19 at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

FRIDAY, May 12, 1961.

The CHAIRMAN: Good morning, gentlemen, we have a quorum and the meeting will come to order. This morning I am very pleased to introduce to you Mr. O. G. Voss, president of International Harvester, and he in turn will introduce the members of his organization.

Mr. O. G. Voss (*President, International Harvester Company of Canada Limited*): International Harvester Company of Canada Limited, is pleased to have been given the opportunity to present its views on the factors influencing the prices of its farm equipment products.

Before proceeding further, I should like to introduce my team here this morning. On my immediate right is Mr. C. C. Brannan, who was formerly manager in charge of sales of farm equipment for our Canadian operation. He is a Manitoba man and is now vice-president of the company in charge of merchandising and employee services.

To his right is Mr. Gay, the comptroller of our company; on his right is Mr. Jolley, secretary of the company and behind him is Mr. Edmonds, our assistant secretary.

Now, at the risk of being misconstrued and misunderstood, I am going to depart from the brief on numerous occasions and present some charts in which I think you will be interested. Indeed, if I understand the objective of your committee correctly, you will be very much interested in them.

When we first made up our brief seven or eight days ago, and even in the final stages, I do not think we exactly knew what you men were driving at. We thought you were primarily concerned with how we establish prices for our goods, and we emphasized that in our brief. Now, however, I understand one of your basic concerns—and I share this concern—is why farm machinery prices have gone up as much as they have. Understanding that this is one of your greatest concerns, and I heard that when I attended a meeting here two weeks ago, we have gotten together some information along that line which we hope will answer your chief question.

Now, gentlemen, before starting our brief I wish to say that we are going to keep this as informal as possible. I have not fully rehearsed this thing, and so it is not canned. First of all, I should like to say that I want to get through our brief before you start to ask questions which, of course, we shall be very happy to try to answer to the best of our ability. But, as we go through the brief I think you will find that it gives answers to a lot of questions.

We fully recognize that the Canadian farmer has a serious problem to cope with in the narrowing gap between the prices he pays for the goods and services he uses, and the prices he receives for his products.

One of our company's prime objectives is the development of machinery which will lower the farmer's cost per unit of output. We believe that the improvements we have built into our products over the past decade have assisted the Canadian farmer to combat the cost-price squeeze.

Like most other manufacturing industries in Canada, we are faced with a cost-price squeeze of our own—between rising labour and material costs in our factories, and increasingly competitive conditions in the market. These factors have resulted in our having lower profit margins than the majority of

other industries manufacturing durable goods. We consider our profit margins to be too low in relation to our investment in manufacturing facilities, tooling equipment, distribution facilities and inventories.

In the pages that follow, we will deal with the effect which these rising labour and material costs have on our prices. Further, we will submit evidence to show that the farmer still receives good *value* for his farm machinery dollar, despite the inevitable price increases.

Now, I should like to tell you a bit about our history.

The company commenced operation in Canada with the opening of a branch in Winnipeg in 1887. A reorganization of the U.S. Company in 1902 was followed by the founding of the present Canadian company in 1903, as a wholly-owned subsidiary. District offices were opened in the same year in London, Montreal and Regina. In addition to these three points, we now have, and have had for some years, district offices at Saint John, N.B., Quebec City, Ottawa, Hamilton, Winnipeg, Saskatchewan, Yorkton, Calgary, Edmonton and Vancouver.

We have a map here on my left which shows how we blanket the country with distribution outlets. I shall not call your attention to all those now. You know the location of these cities, perhaps better than I do, but you will readily see that we have a good network of sales offices. Later on we shall tell you about our parts distribution and transfer offices in three or four different locations. These will be dealt with a little later as we get to the other installations which we have.

Gentlemen, may I ask can you hear me all right? Is this fan too noisy for you? Is everything all right? I would prefer if you left it on.

To return to the brief, manufacturing operations began at Hamilton Works in 1904 with the production of binders, mowers, rakes and grain drills, and within 12 months Hamilton works was employing upwards of 2,000 workers. Production of farm implements has continued since that time for both the Canadian and export markets. In 1960 our employment at this works reached approximately 3,500 employees. In 1961 a new three and a half million dollar extension to our Hamilton farm equipment works will go into production, manufacturing balers, windrowers, combines and manure spreaders. We are now making all these machines, except for manure spreaders, but in older and less efficient building facilities. This expansion was necessary to manufacture increased quantities of the latter three machines for the export market and that is primarily for the United States, for the parent company for sale in the States.

Quite early in the company's history, in the year 1907, a product engineering department was established. That, gentlemen, is our name for product design. Product engineering is designing as well, so far as our nomenclature is concerned.

Today the engineering department numbers 136 employees, and has the most modern facilities. The department has been responsible for the design and development of many farm machines, a number of which have won wide acceptance in the United States and overseas. These Canadian-designed products, and others, are manufactured at Hamilton Works for the North American world-wide markets.

Hamilton works is the sole source of supply—and I mean the sole source of International Harvester supply—for the North American market of such machines as grain drills, windrowers, field cultivators, chisel plows, diskall type machines, rod weeders, manure spreaders, potato planters and diggers, and so forth. This, in effect, means that our Hamilton works is responsible for the design and production of all the tillage and seeding equipment that our parent company sells in the great plains wheat belt in the United States, and

even makes combines which we sell there. In addition, this works manufactures a wide range of machines such as bailers, mowers, plows, disk harrows and so on, primarily for the Canadian market.

I think you will be very much interested in this next comment, because it has been in the news frequently that American subsidiary companies have not pulled their weight in Canada but we, of Harvester, are very proud of our record in that regard. Last year the company exported to the United States substantially more farm machinery, in dollar volume than we imported from that country—and when I say “substantially” I mean more than 50 per cent. We are proud of that. It was all designed and manufactured by Canadians. I am an American, so I think I can say that, but we are very proud of our crews here and we are very proud of the contributions they have made to Harvester throughout North America.

Contributing to this favourable balance of trade was a new line of Canadian designed crawler tractors and a self propelled combine which have been received enthusiastically by farmers in many parts of the world since their introduction two years ago.

I think we are the only company manufacturing crawler tractors in Canada. We make one of approximately 40 horsepower, and the United States is one of our best customers despite the fact that they make a crawler tractor of approximately the same size down there. We have sold quite a few of these crawler tractors in Australia, New Zealand, even Germany, and elsewhere. To service its customers and dealers, International Harvester Company of Canada Limited maintains an extensive service parts distribution system. Parts depots are strategically located in Edmonton, Winnipeg and Montreal, with the master parts depot in Burlington, Ontario. As most of you know, that is just outside Hamilton. All of these depots are linked by teletype service. The parts stored in this system supplement the stocks held by the company's district offices and more than 900 dealers.

The essence of this system is that adequate supplies of parts are stocked as close as possible to the area of use. I think we have almost pioneered parts depots, first south of the border and then here. As you will see on this map, our main factory is here at Hamilton. Next door is our master parts depot at Burlington. We have a parts depot at Montreal, a large parts depot at Winnipeg and a large one at Edmonton. In addition, through provincial law, we are required to have additional parts stocks. We have parts stocks for farm equipment here in Calgary. In addition, a large depot operates at Edmonton. We have a parts stock at Saskatoon and also at Regina. We have a parts depot at Winnipeg and a farm equipment parts stock, of course, in the depot at Burlington. We also have one at Montreal at the depot, for the province of Quebec and at St. John. Our company has instituted this comparatively new concept in service parts distribution in order to provide better service to our dealers and customers.

This brings us down through the introduction to the meat of our problem. Retail price of farm machinery.

An examination of the dominion bureau of statistics document, “Price Indexes of commodities and services used by farmers,” shows that on the basis of 1935-39=100, the farm machinery price index was 158.3 in 1949, 248.4 in 1959, and an estimated 254.2 in 1960. This is an increase of 56.9 per cent between 1949 and 1959, and an increase of 60.6 per cent between 1949 and 1960.

The main figure I would like you to remember for the purpose of our presentation is the figure of 60.6 per cent between 1949 and 1960. We do not quarrel with the dominion bureau of statistics figures; we assume they are right and I am sure they are. We have a retail farm machinery price index

of our own over this same period 1949 to 1960. It shows an increase of 54.1 per cent calculated on a basis similar to that of the dominion bureau of statistics index for the industry. Our price and contract department developed this index several years ago for our own purposes. For your information, they co-ordinated with the dominion bureau of statistics and got their advice, counsel and suggestions so that we could have something tangible to latch on to. I believe you, Mr. Edmonds, followed that through, and I believe you followed to the letter what they suggested.

International Harvester's retail farm machinery price index over the period 1949 to 1960, has shown an increase of 54.1 per cent, calculated on a similar basis to the dominion bureau of statistics index for the industry.

Any attempt to measure changes in prices of products such as comprise our farm tractor and implement lines, runs head-on into the perplexing problem of evaluating changes in features or quality. The price movements previously referred to for our products fall short in this regard, as does any of the other price index information available. This is quite important in any consideration of price indices, because machines change. Nonetheless, these indices are worthwhile, recognizing their limitations.

The next subject is labour costs. The average hourly labour cost—including overtime and shift premiums, holiday and vacation pay and all fringe benefits—for all hourly paid and piece work employees at our farm equipment works at Hamilton, has risen over the same period by 99.3 per cent.

We have a chart to illustrate the sky-rocketing of our labour costs since 1949. Our labour costs have doubled. This term, average hourly labour cost for all hourly paid and piece work employees, covers what we would normally call factory workers. It includes everybody in our factory who is paid on an hourly basis. It does not include salaried people on the monthly payroll, but it does include our day workers and our piece workers. For all practical purposes it covers our wage earners or factory workers. This is not a technical point and is not subterfuge or camouflage; these are genuine figures taken in our normal way of reporting factory wage earners.

Mr. PASCOE: Will this chart be included in the report of our proceedings?

Mr. VOSS: If the chairman requires it we have facsimiles of these.

The CHAIRMAN: We have included these in our previous reports and should do so in this instance.

Mr. VOSS: So, this is the average hourly labour cost. You would want to know how this was arrived at. It is very simple. We have taken the total wages, fringe benefits and everything we have paid these people and have divided it by the number of hours they worked in each year. There is no more representative way of showing it.

In 1949 it was \$1.35; 1950, \$1.50; 1951, \$1.73; 1952, \$1.96; 1953, \$2.03; 1954, \$2.13; 1955, \$2.20; 1956, \$2.22; 1957, \$2.36; 1958, \$2.51; 1959, \$2.62; and 1960, \$2.69. Our fiscal year starts on November 1 and ends on October 31. I think this figure of \$2.71 for 1961 was made up as of the first of April. Of course, as you appreciate, that is for five months of our fiscal year. In this first five months it went from \$2.69 to \$2.71. You will see this dotted line going up here, and you will see here the asterisk. As of April 22, about three weeks ago, our average hourly rate at the Hamilton works went up another eight cents an hour under the terms of a labour agreement we signed in 1959. So, for 1961, the spiral continues. It is up to 2.78 and may go higher. I am just as worried about this as you are; maybe more so. Where is it going from here? Is this the end? You possibly will have another inquiry here next year the way this is going, and you would probably be justified in doing so, because we have some labour contracts now which provide for automatic increases going into

1962. I believe this is in respect to the salaried employees in one of the office unions; so I can assure you that so far as salaried people are concerned it will continue.

There is one thing more to which I would like to direct your attention. A lot of people talk about wage rates. When you hear wage rates quoted the figures may not include the total cost as to these figures. These figures include the overtime and shift premiums which we pay in the factories. We have taken all of these things and have added them up. All this is divided by the number of hours worked in the course of a year in order to get these figures. There is the matter of vacation pay. After twenty-five years service we give a man four weeks paid vacation at these rates. There are eight holidays a year. At our works in Hamilton we could have a man off one-twelfth of the time at full pay on vacation. They can be off another eight days a year and we have to pay them for that. I am not complaining; I am just telling you gentlemen the straight facts of life. In order to keep the record straight, I think you should know them. There is group insurance, hospital insurance, unemployment insurance, supplemental unemployment benefits. What is this amount here?

Mr. C. C. BRANNAN (*Vice-President, International Harvester Company of Canada, Ltd.*): It is 5 cents an hour per employee.

Mr. VOSS: Yes, 5 cents an hour per employee. You see, gentlemen; it all adds up. You have 3,000 employees. Then, there is workmen's compensation, pension plan and, under Ontario law, jury duty. We pay that, and it goes into our costs. Then, there are items of union expenses, and we pay that as well.

Mr. MANDZIUK: What is jury duty?

Mr. VOSS: Well, if a man is called for jury duty, I believe we pay his salary. Is that not correct, Mr. Brannan?

Mr. BRANNAN: Yes.

Mr. VOSS: That also is something which goes into what we have added together before dividing by the number of hours.

Mr. FORBES: Does your employee get paid as a juror in addition to that?

Mr. VOSS: I believe he does.

Mr. FORBES: He receives that as extra pay?

Mr. VOSS: Yes.

Mr. MUIR (*Lisgar*): Do you have a comparative chart as well for salaried people?

Mr. VOSS: If you would make a note of that, Mr. Muir, and ask me later on, I will dig that out for you.

I know you gentlemen have a lot of questions. I am not trying to dodge any of them, because if you have an answer to this problem, I will be glad to listen to it; in fact, I will listen to you for a week, if you can solve this problem for us. I am a farm boy myself. I know how to slop hogs and milk cows, and I know what you people are up against. All of these things enter into our wage costs.

In connection with this little 8 cents an hour, you can say, "Well, thunder, that is not much money." It is not. It sounds pretty innocent. But, this is one of those automatic things. Perhaps our own people, when under pressure, agreed to it and felt it was an innocent little thing. But let us see how innocent an 8 cent per hour increase is.

Eight cents an hour on the basis of a 40-hour week is \$3.20 a week. That is the increased cost per employee. Now, I have been too busy trying to figure out what figures you gentlemen wanted, and I do not really know the exact number of employees affected. However, assuming that 2,500 of the wage earners in our Hamilton works were affected by this \$3.20 per week, that

would cost us \$8,000 more a week. Is that not right? Then, taking roughly 50 weeks for the year, it would be \$400,000 a year that our costs went up. As I say, gentlemen, that is \$400,000 per year.

Later, we will show you our annual report; take a look at it, and see how much \$400,000 represents in terms of our net profit.

One of our biggest problems today—and I will be frank with you gentlemen—is, what are we going to do about this \$400,000? Did our productivity go up that much overnight? I do not have to tell you that it did not.

So, gentlemen, while you are putting me through the paces, and I know you are going to do that—I know you will, and I am going to cooperate to the best of my ability—I hope you will bear in mind this extra \$400,000 about which I am worried. I think you are worried about it, too. You are all reasonable people; you are sitting on a farm committee, and you naturally are interested in the Canadian industry, as I am, myself. I am just as interested in farming as you are. It is a mutual problem and we have to approach it as such.

Our Hamilton farm equipment works wage rates are among the highest in Canada. We are next door to the Steel Company of Canada. Hamilton is a steel city, and I think it is public knowledge that steel labour rates are higher than the normal rate in many other industries.

Now, there is one thing on which I probably will be quoted, and misquoted in connection with what I have just said here. However, for the record—if there are any press in attendance—there is one thing that I hope you will put down that Voss did say.

I am not taking off on our employees at Hamilton. I think just as much of our factory employees at our Hamilton works as anyone else in the world does of their own factory people. I am not saying that they are a dull lot and won't work; I think they are working just as hard as their neighbours are in other industries. So, when I talk about our rates of pay or our productivity at our Hamilton works, I do not want anyone to suggest to our people in our factories that the president of the company has made a statement that they are not pulling their weight, and that they are making too much money. I think, in terms of what wages are paid locally, and the productivity locally, that our people would compare with the best of them. I am standing behind them 100 per cent, and I am going to defend them.

Gentlemen, let us keep this in the right context. I am not begrudging these people their proper wage, and we are not trying to run away from our responsibilities. Let us say, for the purpose of our discussion, that according to International Harvester's records—and our comptroller would swear to the truth of them—our wage costs since 1949 have doubled. According to our index, our prices went up to 54.1 per cent.

I will now turn to the next page—but let us keep in mind that our wages doubled—and we will talk about productivity. This is a very interesting subject. Let us revert to our brief.

While many industries have been able to achieve sizeable increases in productivity in the period under review, through mechanization and extensive introduction of labour-saving equipment, the nature and volume of our production has not enabled our Hamilton farm equipment works to attain any significant increase in productivity per man hour. We manufacture a large number of machines which are made in a variety of models and with special features for many types of farming conditions encountered in North America. You probably wonder why. I can assure you, gentlemen, that we do not like to put them into production as much as some of you might think. One thing, that is pretty hard to get from us, is a change of model or the

incorporation of special features. However, if the farmer says he has to have this and that, and demands it, well, we have to sell machines and we usually put them in to accommodate him.

In addition, we manufacture large quantities of service parts in comparatively small production runs. While we have achieved minor increases in productivity through the purchase of modern machine tools, and through reorganization of our manufacturing operations—even in building this fancy new building which we are putting up in Hamilton; and I should say it is fancy only in the sense that it is large—the effective productivity increase has been slight in relation to our over-all labour costs.

At this time I would like to discuss with you in some further detail this matter of productivity. Productivity is a difficult thing to measure, and I do not know of anyone in the world who has an answer to the measurement of it. I have talked to our people south of the border, and I have talked to large manufacturers south of the border, as well as Canadian manufacturers. They have not a real measure of it, either.

Gentlemen, you can be sure that we have done our utmost in the Hamilton works to increase productivity, but, for reasons suggested in the brief, the farm equipment industry is not conducive to a high degree of mechanization and automation. To a small extent we have been able to improve our efficiency through plant reorganization, new methods, better procedures labour-saving facilities, data-processing equipment, and electronic devices. Where we have purchased new machine tools—which you do not do every day in a small-volume industry like this—we have in all cases bought machine tools with faster speeds, and so forth—at least we have checked the economic of buying them in order to justify their cost, in an attempt to get more output per hour dollar of labour cost. We are hopeful that our new building at the Hamilton works, which is all on the floor, will give us some increase in our productivity. That is why I said that although many industries have been able to achieve sizeable increases in productivity during the period under review, through mechanization and extensive introduction of labour-saving equipment, the nature and volume of our production has not enabled our Hamilton farm equipment works to attain any significant increase in productivity per man hour. Generally speaking, our quantities of machines are low. The varieties are great, but our production schedule on components is too low to justify the high capital cost of high-volume mechanization.

As you know, the number of farms in Canada has decreased, and the number of machines used on these farms, therefore, has declined. These machines have become larger, can do more work, and therefore there are fewer of them. Also, they last longer. It is a vicious circle. All these factors add up to smaller production runs. There is only one section in our Hamilton farm equipment works where we have quantities sufficient to get up to any sizeable degree of mechanization, and that is in our disc blade department, where we turn these blades out by the thousands. However, that is only a small portion of our works, and it is peanuts compared to the over-all picture.

To really increase productivity, in terms of what you people think about, and what people normally think about when talking about it, you have to think in terms of batteries of transfer machines and pushbutton controls. We do not have a semblance of a transfer machine in our Hamilton works, and I cannot foresee production increasing to the point where they can be installed. We cannot automate like the manufacturers of steel, automobiles, and so forth. We have machine-tool suppliers from all over the world in our factory every day of the week and we lay our problems before them. We say to them: "Here is our job, the piece of equipment we are going to make". We are going through

this daily. Dozens of people are working on this all the time, but you must have some volume of production if you are going to get the benefits of automation—high productivity.

Our labour rates have increased, just like they have in the automated industries, but we have not been able to increase our productivity like they have. You do not set up automation to do five hundred of this, four hundred of that and seven hundred and fifty of something else. You cannot automate the baler assembly line. But, in so far as the efficiency of the individual worker is concerned, our productivity standards are still established practically the same as they were in 1949. In other words, where we are making a part and the part is the same as it was in 1949—one or two of our machines have not changed much—with the same men doing the same work in the same way, so far as we are concerned the amount of labour in it would not have changed and, if all those factors were considered, if they were constant, then it would be safe to say our labour cost has doubled. There are no two ways about it.

I do not think people in 1961 are working as hard as they did in 1949. We are all human, we have got to face it. 1961 is the day of convenience, a day when you cannot expect people to give more. To expect more painful physical effort is a thing of the past, whether you like it or not. I am not arguing with the trend, as I like convenience the same as you men and everyone else does. I do not think our people are working any harder today than they did in 1949, and I do not think some of your hired men are putting out more physical work in 1961. Our people in this factory are humans just like your own hired help.

Now, gentlemen, there is no exact method of measuring productivity known to us. People in the automotive industry will frequently measure their productivity in terms of units per worker. They say: "It takes so many man hours to make a car. Now, ten years ago it was so many additional man hours". But, if you manufacture farm equipment you measure your output, because of the variety of the machines, in terms of tons rather than in terms of units, and in one of the production charts which I have here you will see factory shipments measured in tons of output. This will probably give you a clue as to how you can measure productivity to some extent. What we have done is we have taken our annual shipments of factory production from our Hamilton works and divided them by the average number of wage earners employed in our works, for each year from 1954 to 1960.

I can say that we thought a long time before we decided we would publicly give you this information because it has to do with the efficiency of our business and we were anxious about this, for reasons you can well appreciate. These figures can be misunderstood, and that is another reason we thought long about it before finally deciding to show them to you, as we are doing now.

This chart tells the number of tons of products we shipped out of our Hamilton works per hourly-paid wage earner per year. So, let us have the sad story.

I cannot quarrel with the figures. I am sure they are right. I had the comptroller of the company, the auditor of manufacturing and the works auditor in my office before the chart was prepared. "Look" I said, "we are leading with our chin. These have got to be right". They said they were.

Here is our wage spiral, the same as what you saw previously. It shows wages from 1954 through 1960, increasing from \$2.13 to \$2.69. Do not keep the figures in your minds; but look how they jump. These figures include, the same as they did on other charts, fringe benefits; and on, chart No. 2, factory shipments in tons per year, per hourly-paid and piecework employee.

CHART 2

FACTORY SHIPMENTS (IN TONS PER YEAR)
PER HOURLY PAID AND PIECE WORK EMPLOYEE

I believe, Mr. Horner, you brought this up a couple of weeks ago. I probably got the idea from you and Mr. Brannan developed the thought. He is a good practical farm boy from Manitoba. He said: "That is probably what they want".

The chart shows 1954, 23.3 tons per year per hourly-paid and piecework employee; 1955, 27.6; 1956, 27.4; 1957, 24.8; 1958, 26.0; 1959, 23.8 and 1960, 23.4. The average for the seven year period is 25.2 tons per hourly-paid and piecework employee.

I am not saying for a minute you want to take this 1954 figure and compare it with this 1955 figure here. The machines made in one year are not exactly like the machines made in other years. The changes have been progressive.

This chart is important from the standpoint of trend, so look at this rather in terms of averages. Forget the high and the low. Just look at the averages. In 1959 and 1960 you see the output is down to 23.8 and 23.4. What I am saying is that, compared with this labor rate chart, this output has remained so constant that I do not care whether you say productivity has gone up 10 per cent, 12 per cent, 15 per cent, or what. The improvement in output is nothing in relation to this labour cost chart.

You may draw your own conclusions from these figures. They are correct and I hope you realize that releasing them does act to our detriment. I am not proud of them. I am not condemning our factory workers for them, but I often wonder, "Is this the very best we can do?" We are working on this problem every day. Gentlemen, I am worried about this, just like you are.

Now, there is one thing you can say about this chart or anything like this. As I told you, the machines change and the first thing someone will point out and say is: "But, in 1960, the machines turned out were lighter in weight, and therefore the tons per worker would go down."

I would answer that in this way. Self-propelled combines and other machines being made in 1960 do have more precision components than those made in 1954 but, I would point out that we do not make engines in Hamilton, or hydraulic pumps and valves and that sort of thing. So, we are getting more of these precision components from the outside, which would give us a higher tonnage per year; and our employees do not have to put any labour into them at all. We have actually been buying more and more of these material components, as you will see from some figures which you will get later. You can analyze the figures and try to see where productivity has dropped five per cent, and where it has gone up 10 per cent and 12 per cent, but do not think of it in those terms. Think of it generally. Keep this average figure in mind. Look at it and see what the trend is.

Mr. HORNER (*Acadia*): Will that chart be printed?

Mr. VOSS: Yes. These things have been made up and they are not in the brief because, as I told you previously, when the brief was prepared we did not know exactly what you were after. Having attended a previous meeting, however, this is really what we thought you were driving at.

Now, in addition, we have a further chart which deals with specific sections of our works where production is ordinarily gauged in term of tons, rather than in terms of units, and it deals with our foundries.

This chart will show the weight of good castings produced per man hour, first in our grey iron foundry and, secondly, in our malleable iron foundry, for the period 1949 to 1960.

The foundries always measure their output in terms of pounds per worker.

Here again there is some room for argument because the size of castings can

INTERNATIONAL HARVESTER COMPANY OF CANADA, LIMITEDHAMILTON FARM EQUIPMENT WORKSFOUNDRY PRODUCTION

Pounds of
Good Castgs.
Per Man Hr.

GREY IRON FOUNDRY

Pounds of
Good Castgs.
Per Man Hr.

MALLEABLE IRON FOUNDRY

vary from year to year, and it would be wrong to analyze this chart in terms of what happens from one year to the next; but I do suggest it is indicative of trends and has a significance from an average standpoint.

Here is the grey iron foundry from 1949 to 1960, and this represents the pounds of good castings per man hour. If your efficiency were down, if you had men inexperienced in the work, then the percentage of good castings would probably drop. But again I say this only points to trends. In 1949 it was 39.8; 1950, 44.5; 1951, 40.4; 1952, 44.7; 1953, 48.4; 1954, 47.2; 1955, 51.4; 1956, 53.5; 1957, 56.1; 1958, 48.4; 1959, 44.6; and 1960, 47.8.

I will tell you something interesting about these figures. It will surprise you to know that 1957 was the year when we had our lowest tonnage during this period. What happened there was that we had to lay off short-service employees, and got right back to the good old hard core of experienced foundry workers. The experienced foundry worker can make a higher percentage of good castings. He is experienced and he puts out more, so our efficiency went up higher; but here in 1958, the tonnage started going up. We hired more men off the street, less experienced men, and efficiency dropped. Tonnage went up here in 1958 and output dropped again. In 1960 tonnage about stayed constant with 1959 but efficiency went up because these people were getting more efficient.

I did not put the tonnage under the years because I did not want to disclose them publicly. Of course, if you want to see any one of them I shall let you see them.

That is the grey iron foundry where the average is 47.72 pounds of good castings per man hour, but the labor cost of the man hours have doubled and output has not.

Could you men in all sincerity look at that chart and say the Harvester grey iron foundry productivity has increased substantially? No, you could not. No one could. We have not been able to mechanize that foundry.

Mr. HORNER (*Acadia*): You have a very different average for the other one?

Mr. Voss: Mr. Horner, here is the malleable iron foundry chart: This average is down to 30.98 and the figures are as follows: 1949, 28.0; 1950, 31.9; 1951, 33.2; 1952, 34.8; 1953, 30.0; 1954, 32.0; 1955, 33.5; 1956, 30.0; 1957, 31.4; 1958, 31.7; 1959, 27.3; and 1960, 28.1 This 1960 level will start creeping up again, but it is a lot like the old business cycle; it goes up and down but the average here, gentlemen, is 30.98. Someone can say the productivity has dropped ten per cent and I would not quarrel with that. I would agree with them here. I do know the weight of the castings has varied; but there is not much you can put your finger on for an increase in productivity.

I am not proud of these figures but I think our people have done the best they can. They are working on this job every day.

We thought of one other way that we might be able to try to measure productivity. We thought that perhaps if we could take the percentage increase in our labour cost from 1954 to 1960 and compare that with the percentage of increase in our factory wages per ton of product shipped that it might tell us something. You can see, going from 2.13 to 2.69, that our labour cost is up 26.3 per cent. Our factory wages per ton shipped in 1960 were only 24.2 per cent up over the wages per ton shipped in 1954. Do you follow me? Cost of labour went up twenty-six per cent. The cost to us in factory wages per ton shipped only went up twenty-four per cent. So you might say that the difference between these was an increase in productivity. The difference there is the difference between 24.2 and 26.3. You might say that it has gone up eight or nine per cent, whatever the figures are, but there has been small increase in productivity there.

Those are the only three measures I have been able to put my fingers on. Of course, if there is any other way, I would be happy to have you tell me individually after we are through, because I am looking for the answer just like you are.

Two days ago, knowing we were coming up here, I called together the works manager of farm equipment, the works assistant, all the departmental heads, the industrial relations manager, the head of the planning department, the mechanical engineer and the men in charge of the machine repair and tool rooms. I told them that I would be going to Ottawa where I would be making some statements on productivity. I showed them these figures and asked them in their opinion what the increase in productivity was. They said they were disappointed to say that it has been very minor. They pointed out they bought this or that machine tool with electronic controls, automatic feeds, and so on. They say we have lost some of what we had gained because of certain labour practices over which we have no control.

In our industry here is one of the things which hurts us the most. I am not criticizing, but it is a fact of life. I do not say it is good or bad. This is what these men said, and I think it is true. They say it is a result of the plant-wide seniority which we have and the bumping which is involved when we have a lay-off. While we have done our utmost to schedule our production so that we eliminate peaks and valleys and can keep a constant labour force in our factories, we can never do this completely successfully. We have been much more successful in the last few years than we were a few years back when every summer we had plant shutdowns—that was typical of the industry. We are making more machines out of season so that we can keep this level of employment constant. We cannot, however, completely avoid some lay-offs because our business is seasonal. It is dependent on crop conditions and weather conditions just like it is in respect of the farmers. For some reason or other seeding may be late as it is very frequently. The farmers wait until the last minute, and then they are not as likely to buy grain drills from us. The same thing applies in respect of combines. Once we see that we have built more combines than we can expect to sell we have no alternative but to stop production. We cannot get away from that. We do have these lay-offs and they cannot be avoided.

What these men told me is this. Let us say we lay off fifty people out of thirty-five hundred. It may dislocate one-hundred and fifty people from their jobs. Suppose we laid off, for example, ten men in the foundry or in the press shop; this might result in laying off ten men from our combine assembly line and replacing them with ten men from the foundry or press shop who have never seen a combine. These would be men who would have the right to qualify for that job. They have five days in which to qualify for it. I am using a layman's example here. Let us say you have had ten men on your combine assembly line. Their base rate of output is one-hundred per cent, but these men really know their jobs; there is no lost motion and they are actually putting out one-hundred and twenty-five per cent. They are on a piece-rate basis. Bang! We do something which results in the dislocation of these people. They are low in seniority and so they go out the door. Then we have new people coming on. Our labour relations man tells me that for the first day you can expect the efficiency to be forty per cent and maybe the next day fifty or sixty per cent. The man has five days to qualify and get up to one-hundred per cent—not one-hundred and twenty-five per cent where it was previously. If the man does not succeed, somebody else has a chance to step in if he thinks he can qualify. What happens? Can we ship Mr. Horner a combine with people who are not thoroughly experienced, and take a chance? No. The cost is not only in this loss of productivity; it is in the fact that we may have to put on one-hundred per cent inspection. We have to take managerial people and put them out here for close supervision.

I am not complaining about this practice; it must be good—we have it. There is apparently nothing we or you can do about it. It is here; it is a fact of life. However, this affects us much more than someone else who is highly mechanized. I have been in many of our works which are highly automated. You just press a button and the part comes out practically finished. That is a different proposition than putting farm machinery together or moulding in a foundry. Things like this have affected our efficiency. This has outweighed some of our gains. These things I have spoken about are becoming more difficult every day.

Well, gentlemen, there we are. I certainly am not anti-labour, and I do not want to be construed as such. I have spoken to you frankly. You may have gathered from my remarks that I am very critical; I am not. Our factory employees are very cooperative people at Hamilton and they are conscious of this problem and want to do their best too, I must tell you, however, after looking at these figures, assuming this is the major yardstick we have to measure success from, that I cannot put my finger on anything which would indicate that we have gone up in productivity anywhere near in line with our increase in wages, which has doubled.

We recognize an obligation to three types of people, and have to be fair to all three. In the interests of all three groups, I think we have every reason to be concerned. These are the shareholders, our customers and our employees. I am very concerned about this problem in the interests of all three groups, because my question is, where does it end; is there ever to be an end to it? Whenever increases in wages, salaries and standard of living are not offset by increases in productivity, costs and prices go up and you cannot avoid it. It is as simple as that, and you cannot get away from it. If the things our customers have to sell do not increase in proportion to the prices of the goods they buy from us, all three are in trouble,—our shareholders, our customers and our employees. It applies to all three of us. So long as the customer's price of the things he has to sell keeps going up in line with these prices, everything is lovely. Automobiles go up in prices; every year salaries go up in price—fine, so long as they go up proportionately. The farmer's income has not risen substantially, if at all. It is constant and our prices go up. I am worried about it, and I am not going to try to hide it. It is my opinion also that this is the reason why we have lost most of our farm implement export market, outside of North America. We do an excellent job in the United States and North America, but outside of the United States, no. I told you we sold some of our small Canadian crawler tractors; that is in a different category. In the implement field we are priced out of the picture. We used to have quite a bit of it.

Thus far I have dealt with labour costs and productivity. Now I would like to get back on the brief to costs of materials. They also have gone up.

There is no accurate index of the costs of the materials we use, since today's products have markedly different components from those we were making in 1949. However, iron and steel are still the principal materials we use and there are figures available for these from the dominion bureau of statistics and from our own records. The dominion bureau of statistics whole-sale price index for iron and its products, based on 1935-39 = 100, was 175.5 in 1949, 255.7 in 1959 and an estimated 255.8 in 1960. This is an increase from 1949 to 1960 of 45.8 per cent.

You might make a note of that.

The index for rolling mill products was 160.5 in 1949, 249.2 in 1959 and an estimated 250.7 in 1960. This is an increase of 56.2 per cent between 1949 and 1960. Our own records show that our average cost per ton of rolling mill products in 1949 was \$94.01. In 1960 this average cost per ton was \$148.33, an increase of 57.8 per cent.

There have been a lot of other increases in materials. I have tried to get some information and I went to Mr. Walter Gayfer who is one of the best purchasing people in Canada—he is well experienced, has been around a long time and is a director of our company. I asked him to make up a general index to show you how other materials have gone up. We have been talking about steel; but what is happening to other things? He said he would do his best. Here is the list he gave me. It is an interdepartmental letter which I do not want to put on the record. It is dated May 10th, and reads as follows:

We are showing below a list of commodities used in large quantities at the Hamilton Farm Equipment Works and have outlined the percentages of increase in our costs between 1949 and 1960. In most of these items it is difficult, in fact almost impossible, to submit an average percentage of increase on any one commodity as these percentages vary considerably, so we have chosen representative examples.

I would like to read off a couple of these examples to you, both those that are favourable and those that are not.

Here are two favourable ones: We use pig iron quite a lot in the foundry, and that has gone up only 33.8 per cent, or one-third.

Coke has gone up 24.5 per cent, so that is up only a quarter, and that helps to absorb some of our labour figures.

Steel pipe has gone up 49.6 per cent for one size, 51.7 per cent for another size, 50 per cent for another size, and 53 per cent in another. So, you can see that steel pipe has gone up an average of roughly 52 per cent.

We use a great deal of seamless steel tubing. I cannot explain these figures, but they are taken from our records. The 2½ inch tubing has gone up 59.8 per cent, and the 1-7/16 inch tubing has gone 93.4 per cent. Those are the two sizes which we use predominantly.

Next are steel coil springs. As you know, we use a lot of them in the implement business. On one component, it has gone up 91.6 percent; two items have gone up 106 per cent; there is one that has gone up 50.8 per cent, and another that has gone up only 19.9 per cent.

Then, steel wheels for pneumatic tires, and we use a lot of those. They are a good, stable commodity. One size has gone up 34 per cent, and another one increased 62.9 per cent.

Here is one we use a lot of, as any of you who are farmers will know—it is malleable chain, and that has gone up 87.4 per cent. That really has jumped. Someone was concerned about chains the other day. Under steel sprocket chains, one item has gone up 54 per cent, another item 68 per cent, and another 134 per cent.

Then there is steel coil chain. One has gone up 88.4 per cent; another one 111 per cent, and another 157 per cent—and that is from 1949 to 1960.

Roller chain is next. One size has gone up 32.4 per cent, another 78.2 per cent, and another 97 per cent.

I have only one further item which he has given me here, and that is ball bearings. One of them has gone up only 17 per cent, another 28 per cent, another 41 per cent, and another 42.5 per cent. The reason I called this off to you is because this is probably the highest volume of material, other than steel, that we buy.

I want you to know that some of these have gone up as much as 157 per cent. The least any has gone up is 17 per cent, but that is just a small item.

Mr. MUIR (*Lisgar*): Do you buy those already made up?

Mr. Voss: Yes. We do not make ball bearings. All these are purchased complete. That is a specialty job, and practically all would be bought in Canada.

Mr. THOMAS: Mr. Chairman, may we have that report included in the minutes?

Mr. Voss: I think it will be in the record anyway. I have given you everything that is on it.

I would like to cut my letterhead off it, and give you just the figures. The portion which I wish to detach is just a letter addressed to me. Would you take that off? Gentlemen, we do not want this to become too informal. The following, therefore, is a list of commodities used in large quantities at the Hamilton Farm Equipment Works and have outlined the percentages of increase in our costs between 1949 and 1960. In most of these items it is difficult, in fact almost impossible, to submit an average percentage of increase on any one commodity as these percentages vary considerably, so we have chosen representative examples.

<i>Commodity</i>	<i>Percentage of Increase</i>
Pig Iron	33.8
Foundry Coke	24.5
Steel Pipe:	
1" Extra Heavy	49.6
1" Standard	51.7
1½" Extra Heavy	50
1½" Standard	53
Seamless Steel Tubing:	
2-5/8"	59.8
1-7/16"	93.4
Steel Coil Springs:	
1 Item	91.6
2 Items	106
1 Item	50.8
1 Item	19.9
Steel Wheels:	
1 Item	62.9
1 Item	34
Malleable Chain	87.4
Ball Bearings:	
1 Item	17
1 Item	42.5
1 Item	28
1 Item	41
Steel Sprocket Chain:	
1 Item	68
1 Item	54
1 Item	134
Steel Coil Chain:	
1 Item	157
1 Item	88.4
1 Item	111
Roller Chain:	
1 Item	32.4
1 Item	78.2
1 Item	97

The examples used for this study would be representative of all sizes and types of the commodities shown above used in the manufacture of our farm equipment.

W. R. Gayfer.

This is a letter addressed to me and if you could take the top off, it could be included.

The point is that I would sincerely have liked to get you a material cost index, but I just do not know how to make it up. Had our percentage of roller chain in these various sizes been constant through the years, we could have made up an index that would have meant something to you. But our usage of these things varies so much from one year to the next that it would be impossible. The only thing you can do is look at these various components and draw various conclusions. Have faith in our cost department, as I say sometimes.

In addition to increases in material and labour costs, there have been increases in taxation, in the cost of new buildings, machinery and equipment; in sales and promotion costs, and in research and development. The following examples are typical of the increases experienced. The first one sounds very interesting—taxation increases—perhaps we should call for an investigation. Seriously, gentlemen, this item—taxation increases—has gone up percentage-wise more than any cost, I believe, I can cite to you today. Listen to this:

At our Hamilton works farm implement manufacturing plant we have seen our real estate business taxes rise from \$89,865 in 1949 to \$331,147 in 1960, an increase of 268.5 per cent.

Mr. McINTOSH: Is there no expansion on this?

Mr. Voss: No, sir, exactly the same on these. The treasury department wanted to make sure that were were comparing exactly the same thing.

Mr. MONTGOMERY: That would be all local.

Mr. Voss: I am sure you gentlemen have no control over this one. Whether you do or not, you have influence. I presume the cost of government has gone up in line with our cost of labour, and so on. We are saying costs have gone up, so we cannot complain too much.

Our district sales office in Regina paid taxes of \$12,976 in 1949; by 1960, the tax bill was \$26,117, an increase of 101.3 per cent. Mr. Pascoe knows the building—it has not changed from 1949 to 1960.

Mr. McINTOSH: Saskatchewan is a little bit more considerate.

Mr. Voss: Yes, they have done pretty well because their tax increase has just been about the same as our labour increase—almost double. At Montreal we paid real estate and business taxes of \$11,965 in 1949 and \$26,415 in 1960, an increase of 120.8 per cent. These examples are typical—we have not just pulled some out of the air and given you some high-sounding principle. I do not think we ought to single out any particular city or area, because it is typical.

Research and development costs—in order to manufacture new products in Canada and improve existing ones, we have made very substantial investments in research and development. Exclusive of capital investment in research facilities, this expenditure amounted to 0.53 per cent of our total sales of farm equipment in 1949, including service parts. In 1960, this operating expenditure had risen to 2.95 per cent of farm equipment sales. The reason why it jumped so much is as follows: first of all, it is true that we have undertaken the development of machines like balers, combines and that sort of thing, on which you would have a higher percentage of research and development costs than you would on a tillage tool, I suppose. There is another big reason for it, because when your labour cost, as it was in 1949, was only \$1.35 an hour, you cannot spend as much money trying to refine the design down to save a little in weight or labour as you can when your labour cost has gone up to \$2.70. So we are doing a lot more testing to find out ways and means of making a machine just as strong as it was before, and still take out material, if you

like, or weight, or substitute material to keep these costs from skyrocketing in line with our labour cost. We have spent a lot of money doing it, but a lot of that has come back to us.

In addition to research and development costs, it is necessary to make heavy expenditures for tooling to manufacture the more complex farm machines, such as combines, windrowers and balers. However, these large expenditures are essential of we are to build machines which will give the farmer productive capacity greatly in excess of that of ten years ago.

Sales and promotion costs—sales and promotion cost increases are difficult to define, but as an example—you men know that we have got to advertise to sell our goods, otherwise we are in trouble. One way to get the message to the farmer is through advertising. Advertising costs have risen substantially over the period. In 1949 the cost of a black and white page of advertising in the seven principal farm publications was \$6,510, and the market numbered an estimated 650,000 farms; by 1959, this cost, in the same publications, was \$10,850, or an increase of 67 per cent to reach a market estimated at 550,000 farms; and in 1960, the cost was \$11,102, an increase of 71 per cent over 1949, to reach a still smaller number of farms—547,000.

As a result of these increases in advertising costs, we have found it necessary to curtail our advertising programs to what we consider the minimum. Although industry in general has found it expedient to use radio and T.V. advertising to promote the sale of its products, we have not felt that we could afford the cost of these media. I believe a few of our dealers in some areas may have got together and had radio programs of some type, or maybe even a television spot, but we as a company have not felt we could afford them and we have not gone into it. It has been proposed several times—I do not mind telling you—and we have investigated it carefully. To date we have not done it.

I think I can wind up the prices end of this, Mr. Chairman, by 11 o'clock.

Retail prices in line with costs—we submit that with increases of this order in our labour costs, material costs, sales and promotional costs, taxation and research and development, an increase of 54.1 per cent in our suggested retail prices over the same period is not out of line.

Now, gentlemen, I think that is a good breaking point, but before we leave I would like to show you one more chart.

This chart is just a summation of what I have said. It shows the relationship between the increases in cost of the two largest ingredients of our product—cost of labour and steel have gone up 99.3 per cent and 57.8 per cent respectively versus our own retail price index of 54.1 per cent. I would like you to keep this chart foremost in your mind while you are levelling your guns at me. I would just like you to keep this in mind because I think it is really appropriate. I have got to keep it in my mind—you men know that. This thing is going to continue to go up. If this, plus other materials which we have to buy, go up; if you would be so kind as to tell me how this is going to stay there or come down, I would like to know. That is my problem. I submit to you, gentlemen, that our industry is indeed fortunate—our customer is very fortunate. Our prices have not gone up in line with our costs and our profit position shows it. The squeeze in this case has been on us, as far as the company is concerned. Here is the crux of the problem, and I think this is a problem that you men want to study. I think it is contained in this chart. I do not think you have to be a magician to figure out why farm machinery prices have gone up. Whenever labour costs and material are so far ahead of productivity, prices go up and they are going to go up some more, I am afraid. I am not too sure that the public in general is of a mind to apply the brakes. We have resisted many labor demands. We have been threatened with strikes when they have come up. We have done our best along this line. We have suffered

INTERNATIONAL HARVESTER CO. OF CANADA, LIMITED

I.H. Labour and Steel Cost Increases vs. I.H. Retail Price Index
1949 - 1960 Inc.

strikes—long and hard ones. I am not condemning labour for what they have got out of this, but I do not think we have given any more than we needed to, or should have, considering our industry and our local conditions.

Well, gentlemen, that concludes price presentation as far as material and labour costs are concerned. We have quite a bit more to cover in our brief, but this is a natural breaking point and the chart will stay up here. We will give you copies of them. Thank you, Mr. Chairman.

The CHAIRMAN: We will meet again this afternoon in this room at 2.30.

AFTERNOON SITTING

FRIDAY, May 12, 1961.

The CHAIRMAN: Gentlemen, I believe we have a quorum this afternoon. At the time of adjournment Mr. Voss had finished page 10 of the brief and was starting at the top of page 11. We will ask you, Mr. Voss, to continue.

Mr. Voss: Thank you, sir.

Well now, it is good afternoon, gentlemen. We are on page 11. I do not think I will hold you so long this afternoon as I did this morning. We have some very important points, however, and there will be some more verbal commentaries which I would like to make to you.

At page 11 we had just talked about the fact that our retail price index was up 54.1 per cent, that we had had substantial increases in labour costs and that material costs had gone up and so on. A large part of this increase inevitably would have occurred even if there had been no improvement in product quality and in its performance on the farm. We will show later in the brief that product improvements over the last decade have been very substantial. Had we not been successful in developing product improvements, the farmers' problem would have been further aggravated. That is quite obvious.

There are some factors peculiar to the agricultural industry which radically influence the production, pricing and marketing of our products.

There is scarcely a farm machine we manufacture that is not used seasonally. Farmers have traditionally deferred buying decisions until shortly before the season of use. If the prospects of the crop for which the machine is needed are not good, the farmer's buying will be deferred and the demand for the machine may dry up in a very short period of time.

These seasonal machines—and they are many in number and their seasons of use occur at different times—must be manufactured and in the dealer's hands ready for delivery before the season of use. Production must commence many months ahead, because it is impossible to manufacture all the machine required in a short period of time. Furthermore, production of the various machines must be staggered in order to provide steady employment in our factories. We feel a very strong obligation in this regard to maintain as steady employment in our factory as we can, despite the fact that we are in a seasonal business. Thus, we must schedule production for our seasonal machines, commit ourselves to purchase material and components, and publish a price, long before the principal demand arises. As production progresses, the estimated demand is reviewed, and to some extent production schedules may be revised accordingly. But this becomes more difficult and expensive to do as production progresses. Here our situation is similar to that of the farmer. Once the farmer's crop is started, it ripens regardless of the demand for his product at the selling season.

The manufacturer has few alternatives available to him if he comes to the conclusion that demand is declining. Within limits, and depending on the

stage that has been reached, production schedules can be reduced—but, as pointed out, this becomes increasingly difficult and costly as production progresses.

As you know, seeding has not started out in the west. However, our grain drills have been out west for a long time. They have had to be. We could not wait and keep them here in the east until we saw what quantity of grain was going to be seeded out west, how soon, and so forth. That will illustrate to you the point we are making.

Likewise, if production costs are rising, we may, also within limits, raise the price. This alternative, however, cannot be used arbitrarily. We cannot long be out of line in price or quality compared to our competitors and still hope to sell our products and retain the goodwill of our farm customers over the long term.

To a greater degree than in most other industries, we are all competing for a long-range goodwill of the farmer, and that provides a powerful incentive to give the lowest possible price, the best service and the highest quality product.

Since we are in the same position as the farmer, in that the demand for many of our products is tied to crop and weather conditions, it is impossible to accurately estimate demand in advance of the season of use. Accordingly, it is necessary, in many seasons, to carry large quantities of equipment over to the succeeding season. This is particularly true of hay harvesting, grain harvesting and tillage tools. We have a substantial investment in these goods, and once the season of use is past, we cannot get our money back for many months. To a greater degree than most other industries, we have money tied up in finished goods for long periods of time.

A little later on we will start talking about service parts and inventories. The same principle applies. I want to discuss how high this cost of inventory actually is; but, with your permission, I will defer that until we get to service parts.

I think you men might like to know what we have done in the way of providing facilities in Canada to take care of the west.

We have a large warehouse at Fort William, and a big transfer stock location at Transcona just outside of Winnipeg. We have had this big warehouse at Fort William for years. Normally, what we do in the late fall is build goods at Hamilton, ship them by water to Fort William where they will be stored for most of the winter, and then, in the late winter months or early spring months, we will receive certain goods which we did not manufacture in Canada, but which came from the United States factories, and they will come up and be off-loaded at Transcona. So, if a dealer here wants a carload of equipment, some will come from the United States; some will come from Hamilton, and perhaps a part of it will come from our twine mill which is also in Hamilton. We would start a car—or, perhaps a half-car—here at Fort William. It would stop in transit here, and be filled up with machines which may have come from the United States factory, and then it would go through. In that way we can take advantage of storage in transit, and our transportation costs will be at the lowest possible level. We have an investment at Transcona in facilities, and we find this helpful in transporting goods toward the west because transportation cost is quite an item.

In our business we normally deal only with our factory cost. The transportation costs in getting the goods from the factory to the customer are added in, by the dealer, and we pay the freight and charge it to the dealer. For your information, we do not make a dime on this freight. There is no profit on it at all, as far as our end is concerned, and our records are not set up to show a profit. Is that not correct?

Mr. W. B. GAY (*Vice President and Comptroller, International Harvester of Canada, Ltd.*): That is right.

Mr. VOSS: We pass the freight charge on to the customer through the dealer.

However, the point I wanted to make, is that as far as Fort William is concerned, these machines are tied up in inventory for a long time before being shipped on to our dealers, and we have to do that to take advantage of water rates to Fort William.

Competition in the farm machinery industry is keen with respect to price, capacity, performance and quality of product, service, and sales promotion activity. For instance, there are no fewer than nine companies in Canada marketing a full line of farm tractors and implements. In addition, there are numerous companies marketing partial lines providing aggressive competition on the particular machines they handle.

Our dealers are, in addition, in direct competition with other dealers in their locality; and this competition involves not only our dealers' retail prices, but the individual dealer's ability to get a fair price on a trade-in, his ability to provide reliable service when and where needed, and also his reputation as an authority on the proper application of farm machinery to local conditions.

We have a tremendous amount of competition among dealers, and those of you who are farmers do not need to have me tell you more on that score. None of you could seriously feel, if you have been out buying farm machinery, that there is not competition among dealers.

Besides all this, there is stiff competition with the substantial amount of good used machinery that is available, both from Canadian sources and from the United States.

I understood you already have heard from the dealer associations. Our dealers are also feeling the effects of the cost price squeeze.

In order for a dealer to furnish proper service, a considerable investment in facilities is required. Because of this cost-price squeeze, it is becoming more and more difficult to obtain dealers with the necessary capital to provide these facilities. To our knowledge, this problem is common to the industry at large. I was talking to Mr. McIntosh during lunchtime, and, I understand, he is on the tariff committee.

Mr. MCINTOSH: No; we have been having problems with the tariff board.

Mr. VOSS: Mr. McIntosh could verify that there are no tariffs on farm tractors or implements coming in from any foreign country.

Mr. MCINTOSH: To clarify this, I did not say "implements", because they have not given me a definition of the term, yet. I wonder if you could give it to me.

Mr. VOSS: I wish I could. We are exposed to competition from all countries in the world. The fact that, outside of a quantity of smaller tractors from Great Britain and France, and perhaps I should say possibly a few from Germany, very little European manufactured equipment is offered for sale in this country, indicates that it is not a fertile field for profitable sales by overseas competition. We think this is an important point for the consideration of the committee.

The lack of European competition in spite of their substantially lower labour rates is probably due to three factors:

1. The extremely competitive nature of the industry.
2. The cost of setting up and maintaining the necessary service and parts facilities,—

and, gentlemen, we have a tremendous investment throughout Canada in service and parts facilities.

3. The low profit margins existing under present conditions.

Our company has always felt an obligation to our customers to provide spare parts for the normal life expectancy of any machine we sell. This requires that we hold our patterns and tooling equipment available for many years and that we also stock the finished parts themselves as a protection to the farmer. The over-all turnover of spare parts in our industry is exceptionally low and it can be readily understood that this is a factor which has a substantial effect on our costs as a result of the money tied up in inventory and in storage facilities for many years.

I should like to make a further comment on that. We have said and showed you that it costs a lot of money to keep a part in inventory for a year. I really would like to know what it does cost, but I do not know for sure. However, there is a general rule which industry in general has accepted over a period of many years. You frequently hear it said that it costs a minimum of 15 per cent to inventory parts, 15 per cent of the cost of the part, of the cost of the machine, or most anything. I would say that is probably a minimum. It costs you 6 or 7 per cent for interest. You know that. It will cost you money to provide storage and you must have a roof over the top of it. It also costs money to heat the building so that employees can stay in it during the course of the year. When you figure out the cost of the janitor, the cost of a stock control system to keep track of parts and the cost of a lot of many other fees and salaries, which are as high as they are today, and you have to reckon with taxes and insurance, you must consider that 15 per cent per annum on your cost is an absolute minimum. I think many people would consider it should be a higher figure.

Let us be very conservative and say, for the purposes of this examination, it costs 15 per cent to have an item in inventory. Gentlemen, this means that if you have a part on hand for three years, a part which cost you \$10 to make, then within three years you have an investment of \$14.50, do you not? That is a very big item. It is one that costs us a lot of money.

People normally figure that they have done a pretty good job in estimating demand for farm equipment parts if they have a turnover of one time; I doubt if you have many people who would have a turnover of one and a half times or even two times. That is pretty high when you figure the hundreds of parts you have to keep. When you are talking about parts margin, one thing you must keep in mind is that before you make any kind of profit you have to have 15 per cent for the cost of inventory, if you have only turned over your inventory once. It is a very important factor.

Dealing with service parts competition, a lot of you men, particularly some of you who have not been using spare parts, probably feel we have a big captive market and that, in actual fact, we have no competition in spare parts. That is quite untrue.

Severe competition exists for many of the spare parts for our equipment which are generally referred to in the trade as "fast-moving" parts. Parts in this general category are manufactured to fit our machines by firms who specialize in this type of business, but who do not make complete machines. These parts are available from Canadian, American and overseas sources. Such "will fit" parts are sold by parts distributors and mail-order houses. Examples of these are tractor engine parts such as pistons, sleeves, piston rings, valves, bearings, V-belts, etc. There are also parts for implements in this category such as plow shares, cultivator shovels, mower guards and knife sections, harrow teeth, disk blades, and so forth. These "fast-moving" parts would cover a sizeable portion of the farmer's spare parts purchases and as a result, we do have many competitors in the spare parts field.

We thought quite hard before we decided we should disclose this next figure, but we thought in all fairness to help see the picture we should, and

we have. 85 per cent of our farm equipment parts sales are derived from 15 per cent of our part numbers. That is 85 per cent of the dollar volume, and it is derived from only 15 per cent of the part numbers we stock. Isn't that something? We get 85 per cent of our total sales from only 15 per cent of the numbers we carry in stock. It gives you an idea. In that way I can show you that on the items where we do have a high turnover, where we get a two, three, four, five or six times turnover, we have a lot of competition on those items pricewise. It is no captive market. On these small volume items, the main frame you farmers would expect us to have on hand, we might only sell one in three years and it costs us 15 per cent a year to maintain it in our inventory. So the parts business is not all as lucrative from our standpoint or from the dealers' standpoint as you sometimes feel it is.

We have, of course, as we mentioned before, a general responsibility to provide spare parts for the normal life expectancy of the machine. As I said, 85% of our farm equipment parts sales are derived from 15% of our part numbers. This results in a high degree of competition in our service parts business.

We, of course, have a further responsibility, as we have mentioned before, to provide *all* spare parts for the normal life expectancy of the machine. When a model of a machine is discontinued from production, the same machine in the hands of a farmer will continue to give years of useful service with the addition of replacement parts when necessary. It is a very costly procedure for us to continue to manufacture a wide variety of slow-moving parts for these discontinued machines. It should be remembered that only 15% of our parts sales are derived from 85% of the part numbers that we stock. It is not unusual for us to be required to set up to manufacture quantities as low as five or ten of a part of this type. Obviously, in this regard, it costs a lot of money to set up the machine tool. Let us say you want to make, and have a demand for five or ten of a needed part, and it is a part which has to be formed with a die. It will probably take two or three hours of two men's labour to put in one die, take another one out and form the part in the machine. I have seen it happen many times. I have seen them spend five to six man hours to set up a machine to make a part and, once we get it set up, we can run off all the parts required in three minutes time. If you saw this work in progress you would appreciate what I am saying.

Obviously, it often costs us more to set up the equipment for the manufacture of these short runs than the price we have established on the part. This is aside from the material and labour involved in its manufacture. To avoid such short production runs, we frequently find it necessary to produce an all-time demand for certain parts and this can result in retaining parts in our inventories for periods of ten years and over. You probably think this an interesting point. I would like to give an example of what we are talking about here. Tooling costs are very high, and let us assume that we are coming out with a new model for the machine and the main frame is an item which requires a substantial amount of tooling—say, if you like, \$100,000. In order to avoid any greater expenditure than is absolutely essential, we might say that we can use our own tooling provided we alter it. It only costs us, say, \$10,000 to alter this tooling. In such a case we would probably say: let us make an all-time demand of the service parts that we would probably require for sale to the farmer and then let us convert the tooling. It could not be brought back to make more of the old ones. In that situation we would make a decision to make an all-time demand. When you start thinking in terms of how many—if we have 30,000 of a machine in a certain territory—how many main frames we are likely to have to replace in the next 10 to 15 years, any estimate that you make is a rough shot in the dark. We always go overboard because we never want to be caught short and have to whittle out one of

these pieces by hand. It would cost us a fortune to do so. So we go on the high side. You know, of course, we are obligated in the prairie provinces by law to carry parts for machines for a period of ten years or longer after a machine is discontinued.

We are not quarrelling with that because we carry parts and inventory for longer periods than that normally. Our policy is the same in the east as it is in the prairie provinces—it does not differ. Our policy would be virtually the same all over the world in all our operations in that regard. Take my example, for instance now. We have estimated an all-time demand of service parts. Let us say this is a large expensive part and it costs us \$50 to make it. We make a ten-year supply of these parts and let us say it costs us 15 per cent a year to keep them in inventory. First thing you know you have a part that originally cost you \$50 and in ten years' time you have how much invested in it? You have \$125 in this part. Then what happens? You will not have guessed the demand exactly right and you are going to wind up scrapping some of these parts you have made and what you will lose is not your original \$50 it cost you to make the part but \$125 you have invested, when you take into consideration the cost of having inventory for ten years. All is not gravy in the service parts business; particularly is that true on farm implements and farm machinery.

The range in prices for competitive machines doing comparable work is usually narrow. It could not be otherwise. The farmer is an informed buyer, and should the price of a machine of ours be substantially lower than that of a competitor and yet appear to be equal or better, the farmer will know it, and this will influence his buying decision. The competitor would ultimately be forced to lower his price or quality, or drop the product. Conversely, if our price were substantially higher, we would, sooner or later, have to adjust price or design or drop the product. They are discriminating buyers, we know from experience.

Because farmers are informed buyers, and manufacturers are informed sellers, there is a tendency for similar machines of similar quality and capacity to reach the same price area. This is an approximation only, for when it comes to individual machines, our products are not the same as our competitors, and neither are our prices. The range of prices for machines to perform similar jobs with similar efficiency tends to become narrow, however, under our competitive system.

The next section is how prices evolve. This is originally what we thought was your primary concern in this inquiry so we have gone into it in rather greater detail than you would normally expect, but we have not removed it.

We realize that the members of this committee are concerned with how prices evolve in a more specific way than the general statement that competition sets prices. We propose to deal with the subject as follows:

- (a) the pricing of a new product,
- (b) the revision of prices.

To really give you a good idea of this, we would have to start with the development of the machine, because that is where the whole machinery is set in motion.

Let us review the steps in the development of a new machine prior to its release for sale. Ideas for new products are constantly being studied by our product engineering department to determine whether they merit further development. If so, approval is given to develop the ideas with a view to designing a marketable and profitable product.

We outline for the development of each new product a price at which we think it will sell, considering the competitive products, if any, and the contribution it can make to the farmer's operation. From this target price, we establish

for our design engineers a target cost which will permit a fair profit, taking into consideration the volume of production, investment in tooling and inventories, dependability of sales demand and other factors.

If the machine were one, such as a combine, where you may have to carry it over from one season to the next, you might determine that you have to have a higher margin of profit for that contingency than you would on a machine with a more stable demand to be sold throughout Canada, such as a mowing machine, or something of that calibre.

The target cost is one which should be reasonably expected when the product is produced in normal quantities, assuming full use of the machine tools provided, normal labour efficiency, and using current material costs and labour rates. The target cost is furnished to the engineering and manufacturing departments to guide their decisions among alternatives of design and manufacturing techniques.

Our engineers, working in close cooperation with our sales people, develop experimental working models which are thoroughly tested in the field to evaluate their performance. Concurrently, our manufacturing and cost accounting personnel estimate the cost for the design developed by the engineers.

If the experimental design proves to be mechanically sound and the estimated cost is acceptable, the project is reviewed again. If from this review it appears that we can enter the new field of competition at an acceptable profit, considering the amount of investment required to get into production, we customarily proceed to build, without the benefit of full production tooling, a limited number of machines for further field tests, usually in the hands of farmers. Our experience over the years has taught that the real and final testing of a machine is obtained only under actual operating conditions, and I might say in the hands of farmers.

When these machines are performing satisfactorily, the project is again reviewed by those responsible for its development. Another close study is made of our costs in relation to our proposed selling prices. The study must resolve three important questions:

- (1) Will our proposed selling price produce an essential rate of profit margin to our company, consistent with the commitment of the assets of the shareholders to the project? That has to do primarily with the tooling expenditure and machine tools, special ones that you would have to get in for the project.
- (2) Will our price in relation to prices of competitive machines permit us to market our product in the desired quantities?
- (3) If the product is novel and has no competitive equivalent, will the proposed selling price of the machine result in sufficient savings to the farmer to justify its purchase?

If all factors concerned still appear favourable, the machine is recommended to the officers of the company for release for full production tooling.

Procuring tooling for a major product requires a period of time, the length of which depends upon the complexity of the tools and the existing demand on the tool makers. It may, and frequently does, require from nine to eighteen months before the product can roll off the assembly line in the quantities provided under the tooling program. Prior to making a general announcement of the new machine, its specifications, features, weights and prices, another close study is made of our costs in relation to our proposed selling prices and the final selling price is determined for the new product.

We submit that this description of how we price a new product indicates the effective manner in which competition helps regulate our prices, our products and our production. I regret to tell you, gentlemen, there is no easy

formula we can give you even for pricing a new product because there are too many factors which must be taken into consideration, as you must readily appreciate.

One of the big ones is competition. We are just like you would be if you were setting a selling price on something that you had to sell. You would want to know how long you would have to keep your money invested in it, and what were the whole economics of the proposition. We cannot take a product's cost and say we add 10 per cent, or 15 per cent, or 20 per cent to it. There may be too many of them where you would be adding 5 per cent; or, to break even, you might have to add 25 per cent or 30 per cent to the cost. You have to take all the factors into consideration, and indeed we do.

Revision of prices is the second situation. In the highly integrated and complex industrial economy of our country, a wage increase negotiated in one segment, or firm, or industry in the economy soon causes similar increases throughout the entire economy. Consequently, when we make wage increases to our own employees, in all probability suppliers of the materials we buy for our production are likewise making increases to their employees.

We have previously explained how it has not been possible for us to expand our production or improve efficiency so as to lower costs sufficiently following a general wage increase to maintain an essential rate of profit without making an upward adjustment in prices. Consequently, a price increase following a substantial general wage increase is almost inevitable.

That is what we saw this morning, gentlemen. If you have a general wage increase, and have not got productivity increases to cover it, you have no alternative but to look at your prices. This, then, is the second situation mentioned above, namely, the one in which price revisions are necessary.

The Committee will be interested in knowing how we arrive at the amount of price revisions—and it could not be simpler.

First, we compute the total effect of wage and fringe benefit increases within our Company. That is roughly the way that we discussed this morning. We then determine what increases will be made by our suppliers. These suppliers are grouped by the type of material, such as steel, brass, aluminum, rubber, electric motors, spark plugs, batteries, etc. The effect of these cost increases on our products is carefully analyzed and prices are adjusted wherever possible.

It is apparent from this description of our approach to price revisions that strong upward pressure is exerted upon our prices by increases in cost of materials and labour. But as we have pointed out, we have real competition in our industry. This situation does not give a manufacturer in our industry arbitrary market power. It brings us face to face with the dilemma of further reductions in our profits or upward revisions in our prices. We do not like the profit squeeze the farmer is presently under, nor do we enjoy the profit squeeze we are now experiencing.

Our farm machinery price index is calculated from our suggested retail prices, f.o.b. factory. The prices actually paid by farmers are determined by the dealers and will depend on freight costs, whether or not there is a trade-in, whether credit is used, and probably most important of all, on the local competitive situation.

Although the farmer buys machinery today to do essentially the same jobs as a decade ago, he now buys machines to do these jobs faster and at a lower labour cost, and to produce a better product than he did then. Also, he buys machines that will do more jobs than a decade ago, so that he may require fewer machines. All this results in a lower cost of production per unit of output.

For example, the major improvement in farm tractors has been an increase in horsepower, which has offset to a great extent the effect of price increases, but not completely—and I am not saying to you today that the price of tractors has not gone up. It has. What I want to do is to give you a couple of examples here, taking the base prices of tractors, and taking all the new and latest features off them, so that we are comparing like with like and we are not off as far horsepower-wise as you may think.

The model "H" tractor developed 26 horsepower and in 1951 had a suggested retail price of \$1,784.50 (f.o.b. factory) or \$68.63 per horsepower; the I-240 tractor of today, admittedly, gentlemen, it is a lighter tractor—with as nearly comparable equipment to the "H" as possible, develops 32 horsepower and sells for \$2,042.00, or \$63.81 per horsepower. The model W-9 tractor—some of you may know it, it is popular out in the western country—was our largest model of gasoline tractor in 1951, developing 52 horsepower and selling then at \$3,112.00, or \$59.85 per horsepower. Today our I-560 tractor, with as nearly comparable equipment to the W-9 as possible, develops 65 horsepower and sells for \$4,170.00, or \$64.15 per horsepower.

Cost per horsepower in the big tractor, for example, has not gone up much, but here again there is a difference in tractor prices. This information is useful largely to show you what we have done and tried to do in order to minimize the price increases that we have had—and I know we have had them. There is no denying that. This does show that the farmer has got better value in comparison with the way that our costs have gone up than he used to get.

I come now to the special features. We have to take these into consideration in looking at tractor prices.

Two other major improvements are the torque amplifier and the independent power-take-off. That is true of our particular line. These have helped the operator increase the average working load on his tractor to a higher percentage of the power available. There is no doubt that some machines, such as power-take-off driven implements have a considerably greater output per hour than they did a decade ago because of these new features which are now available for today's tractors.

You know, many western Canada farmers would be having to buy self-propelled combines today at a much higher price than that which they are having to pay for pull-behind combines, were it not for the availability of independent power take-off on the tractor. You would be surprised at the number of pull-behind combines being sold in western Canada. There is a lot of them, but that percentage would be dropping—and in my opinion it probably would be non-existent,—if we had not been able to develop an independent power take-off for that tractor.

Power assist devices, such as hydraulic control of implements and power steering, have made it possible for teenage children and farmers' wives to handle even the largest tractor safely.

I submit to you that this is quite a valuable feature. There are more teenage children and farmers' wives on tractors today than you might think. If it were not for power steering and hydraulic attachments, they would not be able to operate tractors.

These have, in fact, alleviated the man-power problem on the farm during harvest season, and eased the work load for any operator.

In combine development, variable speed propulsion drives, longer cutter bars and increased horsepower have made the average combine of today capable of handling more bushels per hour than the combine of comparable size ten years ago. We have heard customers state that they can do twice as much work with the combine of today.

The variety of attachments now available has enabled a large percentage of operators to harvest more crops during the season with one machine. For example, oats and wheat are harvested with one set of attachments, soy beans with another, and corn with another set of special attachments, but all with the same basic combine.

That would be more true here in the east than it would be in the wheat belt, but it would be true to some extent out in Manitoba.

Another type of advancement is shown in our Canadian-designed #91 Combine, which is able to manoeuvre much faster than conventional machines. This reduces the time lost during turns at the end of a field. We have witnessed field demonstrations in which the #91 Combine with an 8½' platform, owing to its extra manoeuvrability harvested as many bushels per hour as a conventional machine with a 12' platform.

In the #91 Combine, we have been eminently successful in designing a low-priced, high-capacity Combine designed to fit the needs of the average farmer. This machine, when equipped with a 10' cutting platform for grain harvesting, has a suggested retail price of \$4,889.75, f.o.b. factory at Hamilton, Ontario.

In 1952, we marketed the #125 self-propelled combine with 10' cutting platform, equipped for grain harvesting, at a suggested retail price of \$4,632.00, f.o.b. factory at East Moline, Illinois. It is apparent that the difference in price between our #91 Combine and the 1952 machine is approximately 5½ per cent; but the #91 Combine has much greater manoeuvrability, better capacity and the ability, with attachments, to thresh all manner of crops including corn. The latter crop could not be harvested by the 1952 model Combine. The qualities of the #91 Combine, and the price, have made it acceptable in other parts of the world; and large numbers have been exported to the United States, Mexico, New Zealand and other countries. The large number here applies primarily to the United States, as you would know.

The use of prelubricated or "sealed for life" bearings has reduced the time it takes to lubricate a combine, we estimate, by at least 60%.

The weight of present-day combines of a given capacity is much less than the models of a decade ago, so that they are now able to travel more easily over softer ground and can carry greater grain loads.

In the development of balers, there have been increases in capacity due not only to the new features in tractors, as described before—that is referring to the independent power take-off,—but to refinements in their own construction.

A striking example of this is the comparison of specifications and prices between our #50-T Pick-Up Baler, sold in 1952, with our present production #46 Baler. The #50-T Pick-Up Baler, complete with auxiliary engine (which was necessary for its operation) at a suggested retail price of \$2,376.00 f.o.b. Memphis, Tennessee, had a rated capacity of six tons per hour. Our current #46 Pick-Up Baler operated from the power-take-off of the tractor, has a suggested retail price of \$1,867.00 f.o.b. Hamilton, Ontario, and has a rated capacity of ten tons per hour. We submit that here is another example where, beyond question, the farmer is getting better value than he did ten years ago, a much greater capacity at a lower cost.

Our #46 Baler is more compact, easier to store and easier to service than the models of ten years ago. Bale length is infinitely adjustable within certain limits, permitting the farmer to produce a length of bale compatible with his handling system.

Another feature which greatly enhances the operation of balers is the hydraulic bale density control, available as an attachment, which produces a more uniform bale for better control of barn storage. A bale thrower is available which automatically loads a trailing wagon.

Average width of *grain drills* in use to day has increased, and so has their hopper capacity, measured in bushels per foot of width. This accomplishes two objectives:

- (1) with any given speed, an increase in width results in more acres covered per day, and
- (2) increased storage capacity means less time wasted on the filling operations.

"Sealed for life" bearings in grain drills, neoprene grain and fertilizer tubes, and drop-bottom fertilizer attachments have reduced the maintenance problems to a minimum. Improvements have been made in furrow opener design to increase the speed of operation. Considering all these features, we believe that there is good value in the 1960 drill as compared to the drill of ten years ago. They are not available at the same price. The prices of grain drills have gone up, as you men know. While it is true that modern grain drills, combines, balers, tractors and other farm machines perform the same basic functions as those of a decade ago, there is a vast difference in the *way* these functions are performed.

Measured in terms of "cost-reduction benefits"—which is by all odds the most important consideration—farm machinery is giving the farmer good value for his dollar.

This increase in product value has helped the farmer in a very tangible way to resolve the farm labour crisis and combat the cost-price squeeze. It has been achieved by extensive creative research and improved engineering and manufacturing techniques...and in the face of steadily rising material and labour costs, increased taxation, higher cost of selling and other expenses.

Vast changes in farm technology have made it imperative for our Company to place special emphasis, in the post-war years, on the development and design of those machines on which we could make the greatest contribution to the farmer's productivity and convenience. The consequent changes in design have resulted in sizeable development costs and large tooling expenditures for new machines, and have added to our variety of service parts and complicated our inventories. These penalties are such that we obviously cannot afford a change in the design of a machine for frivolous reasons. We do, however, recognize our obligation to assist in the farmer's progress, but it is impossible for us to reflect progress on the farmer's behalf without obsoleting machines.

Whenever the design of a machine is changed, we have a firm policy not to introduce a new component into our system if an existing one can be used.

I would like to emphasize that again, that we want to keep our variety as low as possible, our parts inventory problem as low as possible. This is a very firm policy which we enunciate to our product engineers many times during the course of every year.

Such a policy benefits our customers and dealers as well as our own Company. An elaborate cross-reference of individual parts used on various machines is maintained to assist in implementing this policy.

The next question is one with which you may take issue. It is one way of putting the problem. There is a lot of merit in it. We wondered, after we considered the things that we went over in great detail this morning, whether the real question here is whether farm equipment prices are too high or the farmer's income is too low.

Is the real question at issue here whether farm equipment prices are too high, or the farmer's income too low?

We are, as you probably know, one of a few American subsidiary companies which release their annual reports. We have done so for some years. We disclose our sales, our total sales, and this is something which few companies have done. Our annual report will show you our selling and administration costs, and our profits and dividends. Our report for 1960 covers the past ten years.

For the year 1960 just past, our net profit was approximately 3 per cent of sales of all our product lines, including service parts,—farm equipment, motor trucks, construction equipment and twine,—and this figure is not inconsistent with the average profit in prior years. You will notice in the last ten years that 3 per cent has been just about on the nose, what our profit has been during that period.

I think probably that you are going to ask me first; well, that is fine, but how much of your sales here were on farm equipment? How much was for other things, and how much was your profit on farm equipment. That is going to be your next question. This profit percentage overall is so low, in my opinion, that when you analyse our annual report, and you see the percentage on capital invested 3 per cent of anything is not very much.

But in answer to your question I would like to tell you this, that our farm equipment profit—and it is pretty hard for us to figure what our profit is on farm equipment, because we have an integration of sales districts out here, which I want to discuss in detail with you; but we, in our own minds, and for internal purposes only, figure out what we feel is our profit on farm equipment.

I do not want to divulge that figure to you, but I will tell you that our farm equipment profit over the last six to seven years, that I know of, is less than 3 per cent. I would say that our farm equipment profit is less than 3 per cent. I am not too sure that this committee is too concerned about whether it is 2.7 per cent profit, or 2.6½ per cent, or whether it is 1¾ per cent. However, if it is very material, I think we can find ways and means of showing you, and doing it in a way which will not embarrass us. That is what we want to do.

Here is what I want to explain. In this presentation we want to lay all the cards on the table. I do not want to appear evasive in any way. I have to go into some detail or you men will be suspicious of me. One always is suspicious of large companies' profits. I am too. What is the guy hiding; what has he behind his back?

Our annual report will show that our selling and collection—and that includes service expense and administration expense—is, right about on the nose, ten per cent of our net sales of all our lines,—construction equipment, motor, truck and farm machinery. When your selling, administrative, collection and service expense is ten per cent of the whole line, and at the end you have three per cent net profit, it is about like taking this pointer here and taking something like this. This much is your product cost, going up to here. Away up to here is your product cost; most of this is your selling, collection and administrative expense, and you have a tiny three per cent down here. That is about the way it is.

We have combination selling districts. As Mr. Korchinski knows, and perhaps Mr. Clancy who is not here, we have a district office at Yorkton which distributes farm equipment and motor trucks, both. Honestly, I do not know what the volume is and which is the larger of the two out there. We are the only major implement company left which has an office in Yorkton. Because we do have motor trucks we can afford to have a combination office. The same people who sell motor trucks sell farm equipment. They might use half of their showroom for each at one time and in other months it might be all motor trucks.

I wish I knew how to break this down in combination districts. One of the district managers may say that half his problems are in relation to motor trucks and another may say it is a third. How do you break down your selling cost? The answer is according to the time of the year, and also we send out a man to find out. If the weather is nice and it is the spring they will be out chasing most farmers trying to sell farm machinery, and the truck accounts are reduced. Generally speaking it is our opinion that the company's selling and servicing cost is greater on farm equipment than on motor trucks or big crawler tractors. One reason is we have a large number of farm equipment dealers and it costs more to take care of and service them than a few dealers, and keep their contracts alive. Also the service and parts turnover is lower on farm equipment.

You can be sure—and it is shown in our annual report—that our selling, collection and administrative cost is a known figure of ten per cent. This little three per cent is our overall profit. If we should try to apportion the selling expense and might say that if the motor truck is eight per cent, farm equipment should be twelve. If we are out just two per cent in this selling expense it means the three per cent is down to one per cent. There are a lot of big variations, but the profit is so small that if you make a mistake in apportioning the selling expense at places like Yorkton, Saskatoon or Regina—there is a combination office in these places and also in London, St. John and elsewhere—you are going to be out of kilter. That is the reason, gentlemen, I will say to you that in our own lines we do try to break it down. It cannot be measured definitely. So we have a profit percentage which we use for internal use. We think it is pretty accurate. I hope you will take my word, and Mr. Gay's, that our profit or loss in each of the years 1955 through 1960 inclusive was less than a three per cent profit after tax on sales of farm equipment. If you should not want to take my word for it, I would be prepared, if you would swear Mr. McBain to secrecy, to show him the figures, put them down on a piece of paper, and let him tell you whether I was telling the truth. Of course, I am, or I would not be making the offer.

Mr. HALES: May I ask if you would say a few words on the profit to the shareholders in this ten per cent?

Mr. Voss: Yes. We will do that in the annual report. The dividends are all there. What I am saying, and what I am trying to get down to, is I do not really think you are too much concerned with how much less than three per cent this was, whether two and a quarter or what. We have a lot of competitors who would love to know. I would not like to disclose it. We are, however, concerned with overcoming any suspicions you have in this regard.

I will continue on with the brief.

We submit this is lower than many industries producing durable goods. We would submit further that this profit does not provide an adequate return on our invested capital and allow for the replacement of facilities so necessary to the growth of our business and continued service to our customers. Because of the seasonal nature of our business, we have to invest relatively more money in inventory than most durable goods industries, and therefore, our net return on sales should be higher in order to carry the heavier investment.

We must strive to be competitive, not only in Canada, but in our export markets. To do this requires that we continue to invest in research and production facilities and in doing so we earnestly feel we will make our best contribution to the lowering of the farmer's production costs as well as our own.

We are always striving to reduce our costs by every means consistent with good management, and thus hold our prices to the lowest possible level.

Our delineation above of our own cost-price problems does not mean that we are not sympathetic to the problems of the farmer. In few industries is there

as close a relationship between manufacturer, dealer and ultimate consumer as there is in the farm equipment industry. The successful operation of the farmer depends to a great extent upon our understanding of his problems and our ability to design and produce equipment which will lower the farmer's cost per unit of output.

We believe that we have succeeded in meeting the farmer's needs over the past decade. In our opinion, the farmer today would rather have a used 1959 or 1960 combine, baler or tractor, than a brand-new 1949 model—because, even at second-hand, the more modern machines are far more efficient than those of a decade ago.

The farmer's need for efficient cost-saving equipment at the lowest possible cost is a concern we have always shared with him—a concern we consider vital to both our interests.

Now I would just like to summarize quickly. This morning we went into great detail in laying before you the fact that labour costs are doubled and the productive efficiency has not come close to keeping up with it. After I was through, I think both Mr. Muir and Mr. Montgomery came up to me and drew one conclusion from my remarks which it took me ten minutes to say. They really put it in a nutshell. You men will be debating this subject for days, but I think one thing they said which amounted to something was this; that is, the problem we were talking about this morning is a problem for everybody. I feel that very strongly. I think it is very true. It took me a long time to see it.

The problem we have been talking about is not a matter for just farm equipment industries, for our labourers and workers in Hamilton, for labour unions, the farmers and our shareholders; it is a bigger problem than that. It is a bigger one than what we were talking about this morning; it is a problem for everybody, and we have a lot of equities we have to weigh up and assess before we come to any conclusions. We do not know the answer. We make the decisions as they come along and, under those circumstances, do our best to overcome these problems. But, you are tackling a very great problem here, and you are tackling one which occupies most of my concern.

If this problem that you are studying today did not exist, my job as president of International Harvester of Canada Limited would be a relatively smooth one, because I spend most of my time on it. I think I know something about it, and I know that I have a well qualified team that also knows something about it.

I am very sorry that I cannot tell you gentlemen that I can foresee an end to the steady rise in prices. There is no doubt about it in our minds. We can assure you, however, that we are not going to relax one bit in our efforts to do everything we economically can do to improve our efficiency and cut our costs. But, whenever your costs exceed your increase in productivity, a manufacturer has only two choices; he must either find ways and means of passing these cost increases on to his customer in the form of higher prices or, secondly, he has to go out of business. There is no alternative, gentlemen, for the long pull. It is just as simple as that.

In closing I would like to call your attention once more to this chart, and I would ask you to keep it in mind throughout our presentation. As I said, as long as labour goes up, as long as our principal material, steel, goes up, and as long as our other material costs keep going up, this 54.1 per cent has got to go up; otherwise there would be no company, no factory, no employees, and no jobs for them. You cannot squeeze this down and let these go uncontrolled. It cannot be done in the farm machinery business, and it cannot be done in any other industry. You men are smart enough to know that I am right. This 54.1 per cent has to go up, too. We have here a bull by the tail. We have a broad problem, and we have a mutual problem. I am worried about it just as you are. I have nothing to hide, and our company has nothing to hide.

I can only tell you, in closing that I am ashamed, in the interest of our shareholders, of our company's profits on farm machinery sales.

With that, Mr. Chairman, I would like to thank you for your attention. You have been a very fine audience. You have listened very intently, and you have not interrupted us at all.

I know you have a lot of questions to ask, and we are going to answer them to the best of our ability.

I would like our secretary to give you a copy of our annual report for 1960, if you would like to have one. I presume you will get around to your other questions after a bit, and we have some people who can give you further information.

The CHAIRMAN: Gentlemen, I know that Mr. Voss has answered a good share of the questions that you probably had in mind to ask him, before this meeting began this morning.

Gentlemen, before we enter into the question period, I think it would be a good idea if we took a two or three-minute break, turned the fans on, and probably open up the doors, in order to get a little more fresh air in the room. We then will come back after the annual statements are distributed, and resume our meeting.

—recess.

—upon resuming.

The CHAIRMAN: Gentlemen, before continuing, I understand Mr. Danforth wishes to put a motion before the meeting.

Mr. DANFORTH: In view of the fact that I was unable to be present this morning I think I should be the first to raise this matter. I should like to bring it to the attention of the committee that this has been an extremely well prepared brief and contains a lot of pertinent information. I would move, sir, that the number of copies of this particular brief be increased by 250, and leave it to the discretion of the hon. members from Quebec, if they wish the number of French translations to be increased also.

Mr. RICARD: I say they should be increased by the same proportion.

Mr. MONTGOMERY: I would like to second the motion. There is a lot of information in the brief.

The CHAIRMAN: Mr. Lyons, the committee Clerk, informs me this would bring the printing up to 1,000 copies in English and 350 copies in French. Is that agreeable to the committee?

Some HON. MEMBERS: Agreed.

The CHAIRMAN: Then I declare the motion carried. Now I believe we are ready for the questioning of the witnesses.

Mr. MUIR (*Lisgar*): Mr. Chairman, first I should like to congratulate Mr. Voss on his very comprehensive statement to the committee. If he will come back with me to page 2, I have three related questions which I should like to put in series. I note that you say:

A reorganization of the U.S. company in 1902 was followed by the founding of the present Canadian company in 1903, as a wholly-owned subsidiary.

Are the shares of this company listed for sale in Canada?

Mr. Voss: No. It is a wholly-owned subsidiary and the shares are not listed on the market.

Mr. MUIR (*Lisgar*): In Canada?

Mr. Voss: No.

Mr. MUIR (*Lisgar*): Then, on page 4 you state:

Last year the company exported to the United States substantially more farm machinery, in dollar volume, than we imported from that country.

Mr. Voss: Yes.

Mr. MUIR (*Lisgar*): Could you give us the estimated balance of that trade, say for last year and for the last five years?

Mr. Voss: I cannot give it to you for the last five years. At the moment I have not got the exact figure but, if I said it were over 50 per cent I think you are not too interested within one or two per cent.

Mr. MUIR (*Lisgar*): I just meant the dollar value.

Mr. Voss: I think that question is about answered in our annual report. Let me see it. You will see it is given on page 11, net sales to International Harvester Company, that is, to our parent company, and you will see they took quite a rise in 1960 when they were \$21,313,177. That would be the total of our sales to our parent company in the United States, and that was for sale down there. Our company, our subsidiary company here, is exceptionally well in line with what the government is hoping that American companies would do. We are very autonomous and I am proud to say that we supply our American company with quite a few collateral components in return for material which we use for manufacture here in Canada. Whenever our American factories need components which they cannot make in their own facilities we get inquiries to furnish those components and, if we are competitive in price and our costs are in line, we get the business. So these collateral components are included in there as well as farm machines, but the bulk of that would be farm machines and some of them would be the farm crawler tractor that I mentioned to you.

Mr. MUIR (*Lisgar*): What is the amount you import from the parent company? I think you gave us that.

Mr. Voss: I did not want to disclose it. I gave you the percentage figure.

Mr. MUIR (*Lisgar*): You gave us the percentage.

Mr. Voss: Do not ask me—you figure it out, will you?

Mr. MUIR (*Lisgar*): The other point is: are your truck production costs reflected in any way in the price of the machinery you make in Canada?

Mr. Voss: No, sir, there is no connection at all between the two. Our principal motor truck factory is, I believe, in Mr. Danforth's constituency, at Chatham. We have a heavy duty motor truck factory, but they are completely separate.

Mr. MUIR (*Lisgar*): The last question is, then—perhaps it is not a fair question—what dollar value of your Canadian sales for 1960 was represented by farm machinery? As I say, it may not be a fair question.

Mr. Voss: I do not like to evade you again, but I am afraid I must. We have never disclosed that figure and it is not because of competitive reasons. You see, if I answer that question, that is put together with figures which our American company publishes. All these figures get put together—it is like smoking me out, and first thing you know we have got nothing left. I will put it this way, that if it is really material and pertinent to your inquiry, and if you are really terribly concerned about whether the figure is \$40 million, \$45 million or \$65 million—

Mr. MONTGOMERY: But it is the big end of the business?

Mr. Voss: No, it is not the big end. If it is really material to know exactly what it is, we would find ways and means to help you.

Mr. MUIR (*Lisgar*): It is not relevant.

Mr. MANDZIUK: Mr. Chairman, without taking up the time of the committee, I was really impressed by Mr. Voss' presentation. I think we all appreciate it. I have only three questions and I think the answers will be brief as far as he is concerned. We had the dealers' association here the other day. In their brief they complained, or rather they alleged, that advertising by implement companies is charged back to them. Does your company do that?

Mr. VOSS: No, sir.

Mr. MANDZIUK: I notice in your brief, on page 10, you allege advertising rates have gone up, and I was interested in that point.

Mr. VOSS: I better be sure, sir, that I get your question right.

Mr. MANDZIUK: Do you charge back any advertising to your dealers, that is pamphlets or monthlies that are sent out to customers? I think you do send out a monthly. They did not specify your company, or any company, as a matter of fact.

Mr. VOSS: If you are asking whether we charge on an invoice—as I believe some people do—a certain price or fee for international advertising, the answer is no, we do not. We do have direct mailing of advertising; in other words, we may print up literature on a machine and we will go to our dealers and say: "If you will give us a selected mailing list, we will mail them for you." They pay the cost of postage plus a very nominal sum. They would add a contribution. We regard that, however, as local advertising, and we do it for a price much less than it would cost them to do it themselves.

Mr. MANDZIUK: But you charge them what it costs you? You are not making any money or losing any money on it?

Mr. VOSS: We are losing money on it. This is Mr. Brannan's section.

Mr. BRANNAN: We have a direct mailing point. When you ask do we make anything on it—do not nail me down on these figures, but this is approximately correct. For three mailings for a harvester and tiller or tractor, they take their choice,—they gave us the list,—our over-all cost would be, say, for the purpose of illustration—and this is as close as I can give it to you—25 cents to make those three mailings. We would charge them something in the area of 20 per cent of the total cost and we would absorb the rest. In other words, they pay for the postage and handling but not for the literature itself.

Mr. MANDZIUK: I have a supplementary question. How about annual get-togethers and these so-called instruction courses, and so on, is there a charge back to the dealer? The dealers have alleged that that is the practice of some companies.

Mr. BRANNAN: As far as our company is concerned, we have service clinics, sales meetings and so forth, but we make no charge whatsoever. They pay their board and room and transportation to the place where we have the meeting. If it is in Winnipeg, for example, the dealer from Oakner would come in or send his man and pay the expenses. No charge is made by the company.

Mr. MANDZIUK: My second question, Mr. Brannan, has to do with complaints I have heard from farmers about the changing of models, which happens too often. How often do you change models? It results in changes of parts, which results in the dealers' complaints about keeping parts for models for 1955, 1956, 1957 or 1958. It loads them up with a lot of spare parts. What is the situation there as far as your company is concerned?

Mr. VOSS: I think I have answered that question.

Mr. MANDZIUK: But, to be more specific?

Mr. VOSS: More specific? The man who determines how soon we have to change models on a machine is our customer. Whenever we can keep selling a machine and do not have to change models, we are very happy. If you gentlemen only knew how many hundred thousand dollars one has to invest in order to change models and how reluctant we are to add further service parts to our already over-burdened facilities, you would be sure that nobody wants to put out new models for frivolous reasons. You do not see us just making sheet metal changes and that sort of thing. If we have to change, it is for functional reasons.

To answer your question specifically, I was just speaking with Mr. Smallwood on that subject and he mentioned that we had made a change in a baler model from 45 to 46, and he was telling me he thought it was an excellent idea. He would be the first to admit that we were wise to make the change. If the customer dictated our change, would not that be correct, sir?

Mr. SMALLWOOD: That is quite right. They did make that change.

AN HON. MEMBER: It sounds like collusion to me.

Mr. VOSS: We resist that, on the part of the management. We resist it as long as we can, but do not forget that the people who put pressure on us to make the change in models, primarily, is the customer.

Mr. SMALLWOOD: My name was mentioned in connection with the baler. It was the number 45 baler, that I mentioned. Mr. Voss did not mention it in his brief. It was manufactured and produced for about three years as a baler that had no fly wheel. It was a very rough baler, and shook to pieces, and by comparison with the model having a fly wheel, they were forced to remodel the number 46 with a fly wheel on it. Is not that right?

Mr. VOSS: That is right.

Mr. PASCOE: Mr. Voss said the customers dictate the changes. Do they write in or do they do it by hiring a model from another company, or how does it occur?

Mr. VOSS: It is done primarily through the dealers. We have men in constant contact with the dealers, and we have our own men constantly in the field. Our dealers and customers have ways and means of letting us know, mostly by word of mouth. We would like to have more letters coming in, but you cannot rely on them.

Mr. PASCOE: If you do not make a change, you lose sales?

Mr. VOSS: When you see your sales go down and down, you have to do something. You know there is something wrong.

Mr. MANDZIUK: As a supplementary to this, may I ask in regard to one you mentioned, the W-9 tractor, manufactured in 1959, there would not be any material changes for 1960, would there, so that the same set of parts would fit?

Mr. VOSS: Generally, they would. The only thing you would have new would be improvements, which, again, one does not like to make.

Mr. MANDZIUK: They would be of a minor nature, would they not?

Mr. VOSS: Normally, yes.

Mr. MANDZIUK: My last question, Mr. Voss, may have a political tinge attached to it.

Mr. MUIR (*Lisgar*): Shame!

Mr. MANDZIUK: I do not want to quote the paper or the group, but I read of an accusation by certain people who think that there is a monopoly control of farm machinery and if that were broken up it would lower the price of machinery. You do not have to answer this unless you want to do so. I think it is important to hear your opinion on it. Is there a monopoly control of farm machinery?

Mr. VOSS: You gentlemen know that that is not true.

Mr. MANDZIUK: I know what you said in the brief.

Mr. VOSS: I can put it this way, I know of no industry that is more competitive than the farm machinery industry. If anyone sought to monopolize it—well, I will tell you frankly, yes, I would like to monopolize it, and if any of my competitors sitting in the back of the room would get complacent so that we could monopolize it, it would be a great feeling, I presume. We certainly do not monopolize it. They do not give us their figures, but I do not know of any competitor we have got that is monopolizing it.

Mr. MONTGOMERY: I think the question inferred that there is a combine among a number of manufacturers.

Mr. MANDZIUK: The way it is put in the paper is “monopoly control of farm machinery”. That is why I asked the question. Thank you Mr. Voss. I think you have answered my question.

Mr. KORCHINSKI: I would like to compliment the International Harvester Company on the appearance they have made here today. I think their brief was a great help to the committee, and in presenting it in the manner he did, I think Mr. Voss has made his job a little easier. However, at the risk of being a real stinker, I am going to ask a dirty question here about a manure spreader. On page 3 you stated that your Hamilton works do not construct manure spreaders. Did I get that right?

Mr. VOSS: That is right, sir.

Mr. KORCHINSKI: The point is this. What is your policy with regard to supplying machinery? Is it your intention to have all kinds of machinery or do you prefer to stay out of certain lines of production?

Mr. VOSS: We are not going out of the manure spreader business. In the United States of America in the last few months we have announced that we are closing the oldest farm implement works down there, the old McCormick works down there, which is being torn down. When they did that they gave us in Hamilton a number of machines we could make, and we are supplying them in the North American market, including the United States of America. Among the machines which we did have and were successful in getting were all their manure spreaders. Therefore, as soon as this new factory extension building is completed in Hamilton—that will be by midsummer, I hope—the Hamilton works will be the source of supply for all the manure spreaders that our parent company sells throughout the length and breadth of the United States. Now, what is your question?

Mr. KORCHINSKI: The point to which I wanted an answer is this: is it your intention to produce all lines of farm machinery, or do you stay out of certain lines because you feel the demand is not there, or perhaps the cost of production is too great in relation to the sale price you could command?

Mr. MANDZIUK: In other words, you cannot be competitive, I think that is it.

Mr. VOSS: I will answer you in this way. We do not deliberately stay out of any line. We analyse our facilities and the type of machine tools that we have, and the abilities of our designers, our product designers. If we feel that the market is sufficient to justify our getting into it, if we feel that it is a machine regarding which our dealer organization could adequately represent us, in other words, if it is in line with the machines they have already got in the Harvester line, I would say we would consider it, as we would almost every kind of farm machinery. To answer your question, I do not believe we are deliberately staying out of any field. We have not gone into garden implements, and that sort of thing.

Mr. KORCHINSKI: For example, the straw chopper behind the combine for shredding the straw—there is not too much of a demand for that type of equipment.

Mr. VOSS: That is right.

Mr. KORCHINSKI: And yet, because you are manufacturers of combines, this is auxiliary equipment and therefore it sort of complements your combine sales; so you might not have a big demand for it, and the relative cost of production of that particular unit may be high, but you still want to sell that type of equipment in order to have the complete line.

Mr. VOSS: In other words, if we had to have a shredder in order to sell combines, and it was going to sell only in small quantities, if there were an existing manufacturer who made an acceptable machine that would fit on the back of our combine, we would give strong consideration to buying it from him.

Mr. KORCHINSKI: I understand that.

Mr. VOSS: In fact, to answer your question, we would probably buy anything that we could buy to better advantage than we could make it. We would farm out our whole line and have it made by someone else for less money, if we could; but I do not believe that we could. However, if we could, I believe we would be interested in doing so.

Mr. KORCHINSKI: Mr. Chairman, my next question is on a different line. I wonder if you could express in terms of percentage what it might cost you, in your overall operation, for retooling when you are going into a new design? Take an average year, for example. Could you express it?

Mr. VOSS: I believe it would vary so much with the machines—it depends on the machine—that it would be impossible.

Mr. GAY: I do not know how we could do it percentage-wise.

Mr. VOSS: No sir. I do not think we could answer your question. We might come close with some figures, which after a while you might be given.

Mr. GAY: You mean on a tooling program. One year it might run from \$20,000 to \$50,000 and the following year it might run anywhere between \$300,000 up to \$600,000.

Mr. KORCHINSKI: Could you give us a high and a low over ten years?

Mr. VOSS: You mean what the tooling was?

Mr. KORCHINSKI: I realize that there cannot be an average. It would be unfair.

Mr. VOSS: The tooling cost of some individual machine—you mean what does it cost to tool? The problem in answering your question is this: if you are speaking only of tooling and dies, that is one thing; but if you are talking about machine tools that these dies work on, that is something else again. If you have to buy a big press, it might cost you \$150,000. Yet the die to go in it might cost only \$2,000. I do not think it would be practicable to try to answer your question.

Mr. KORCHINSKI: Very well, I shall drop it. Could you supply us with the average number of hourly paid and piecework employees since 1949, your highest number and your lowest number in those years? I ask for it, because this average in cost might not mean anything.

Mr. FORBES: Are we asking questions according to the pages of the brief, Mr. Chairman, or are we to ask all our questions at one time? This afternoon one of our good members found it necessary to be unavoidably absent. He asked me to present a number of questions for which he would like to have answers. They look to me to be good questions. I do not know whether I would call them supplementary questions. I do not know if you are calling for

questions page by page or not. There are page numbers on the questions which have been given to me. So if you will kindly give me a little direction in that respect, I shall know whether to ask them according to pages, or not.

The CHAIRMAN: The suggestion was made at one of our previous meetings that we should entertain supplementary questions relative to the main question, because it would make for better reading in our report.

Mr. McINTOSH: It would be very difficult. I think all our questions are supplementary to something that has been asked before.

The CHAIRMAN: The chair finds it difficult to determine whether a question will be supplementary or a new question, when a member takes the floor. The chairman would prefer to let one member continue with all his questions, and finish, and then to go on to the next. Are you through Mr. Korchinski?

Mr. KORCHINSKI: No. I asked a question for which I have not received an answer yet.

Mr. VOSS: Your question was on this chart: how many hourly paid and pieceworkers did we have.

Mr. KORCHINSKI: Yes, or if not the average, then the high of the number of people in employment and the low, employed.

Mr. VOSS: All right. The low average per year—I only would have it for 1954 to 1960.

Mr. KORCHINSKI: Could you supply it as part of the evidence? That would be fine for my purpose.

Mr. VOSS: All right. I would prefer not to give you all the figures, because if I did so, then everybody is going to have the total tonnage of our factory, by years. But it would not do too much damage. Let me see if I cannot satisfy you with this answer: that the low, over a seven year period, was 1353 factory employees, hourly paid and pieceworkers, and the high was 2373. Does that answer your question?

Mr. KORCHINSKI: Is that for the time you have it?

Mr. VOSS: No, for the seven years.

Mr. KORCHINSKI: That is fine.

Mr. VOSS: The high is 2373, while the low is 1353. If we could leave it that way, and that is the average for each of the years, we would prefer it.

Mr. KORCHINSKI: The next question is this: do you manufacture disc blades for any other companies?

Mr. VOSS: No sir, I do not believe we do. We sell to our parent company, and I think we have been successful in getting orders from our British harvester company in England, to supply them with disc blades. I am proud of that. However, we would entertain some orders, if any gentlemen have them.

Mr. KORCHINSKI: I have one more question: in the evidence given before the farm implement special committee of the commons in 1937, the International Harvester presented a table indicating a summary of the grey iron foundry production, with burden percentages, and listing material, productive labour, prime cost—material and labour,—and so on.

At that time the percentage for a ten year average was 35.29 per cent on material, 36.58 per cent on productive labour, and 71.87 per cent on prime cost—material and labour. I wonder if your company would be prepared to present similar tables for both the foundry and the malleable iron foundry production? My purpose in this question is to try to relate the percentages as they were in 1957 to what they are today.

Mr. VOSS: What is your reference on that? These are divided into book-lets, are they not? I am not familiar with what you are reading from. I know about the inquiry at that time.

Mr. KORCHINSKI: I am referring to pages 298 and 299 of the 1937 farm implement committee reports.

Mr. FORBES: Will he stay with your pages, Mr. Korchinski, or will he wander around in the book for himself?

Mr. KORCHINSKI: No. There is a record of it on the fly-leaf.

Mr. JOLY: It is part number five, in 1937. We can get it.

Mr. VOSS: This is in money, materials, production, labour, and prime cost. Percentage-wise I think there is no harm in giving such figures. You make a note of it. The answer is yes, I think we can give them to you in the form of percentages, as you have asked for.

Mr. KORCHINSKI: To follow this up, Mr. Chairman, would you show the cost of materials for them, and the cost of labour also?

Mr. VOSS: There is no question about it, absolutely. Our materials primarily are iron and steel, as we said before and as you know, and everything that has gone into them is either labour with probably ore of some type, transportation, probably some depreciation and maybe some profit that our suppliers have made, some taxes, and so on. But our largest element of cost is labour and I would think that our supplier's largest element of cost is labour. I would be quite sure of that. The answer is yes. However, as I told you this morning in the case of the Grey Iron Foundry, if you make pig iron, every foundry all over Canada is making it and you can automatize it; there is a very high degree of mechanization. But when we have to do this hand moulding on the floor we probably do that exactly the same as we did it ten years ago and probably not a lot different than we did small casings in 1937 and in that case the labour cost would have gone up substantially and to a far greater percentage than your materials.

Mr. THOMAS: Mr. Chairman, I have two or three questions which are pretty well spread all over the whole brief. They are questions of a general nature. I believe Mr. Muir raised this question. I was not sure whether or not there was a clear and specific answer. I will perhaps put it in different words. I would like to ask Mr. Voss if measured in dollars your exports from Canada are greater or less than your imports into Canada?

Mr. VOSS: The answer to the question is that our exports last year in 1960 exceeded our imports of farm machinery and farm tractors from the U.S.A. as I said in the brief, by over fifty per cent. The balance of trade is in Canada's favour. That is not true in respect of Britain. We did import more from Britain than we sold to Britain. We are looking for more things to sell to Britain.

Mr. THOMAS: Can you give us any idea of the percentage of the adverse trade with Britain?

Mr. VOSS: Offhand I do not know the value of our imports from Britain. Mr. Gay says it would be his opinion that we would have exported to the United States and the other countries last year more farm tractors and farm equipment than we imported from the United States and the rest of the world. That would not have been true in prior years, because it has only been in the last eighteen months that we have taken over the supply of all this broad line of implements to our American dealers.

Mr. THOMAS: Could Mr. Voss give the committee any idea of the capital employed per employee?

Mr. VOSS: In Canada?

Mr. THOMAS: Yes.

Mr. VOSS: Yes. It varies with each employee per year.

Mr. THOMAS: Well, say 1960. You could give the number of employees for 1960. In the annual report, it is 6,840.

Mr. VOSS: I think Mr. Gay could figure that out for you and, if we could revert to that after a few minutes, he will give you that figure.

Mr. THOMAS: In dealing with wage rates, which you talked about this morning, I understood you to say that wage rates in 1961, counting fringe benefits, now amount to about \$2.79 per hour for hourly employees.

Mr. VOSS: That is the average, yes. As of today, that would be true.

Mr. THOMAS: How does that wage rate compare with similar employees in the United States?

Mr. VOSS: I cannot answer that question, sir. I can only answer it generally. We have not had any occasion to check it recently, but I understand that that rate would be in the vicinity of 20 per cent less. Is that about right, Mr. Brannan?

Mr. BRANNAN: Yes.

Mr. VOSS: I would like Mr. Brannan to speak on this point.

Mr. BRANNAN: That is my concept of it, but I cannot quote you definite figures, Mr. Thomas. That is what we have in recent months considered to be the disparity.

Mr. THOMAS: Would you say that the volume of production in your Canadian operation would affect prices?

Mr. VOSS: Yes, it affects the degree to which we can mechanize and automate; that is true.

Mr. THOMAS: Then, would a decrease in wage rates in Canada tend to increase the scope of your operation in Canada?

Mr. VOSS: Yes.

Mr. THOMAS: And, therefore, decrease prices?

Mr. VOSS: Yes.

Mr. THOMAS: And, conversely, would an increase in wage rates in Canada tend to decrease the scope of your operation in Canada, and therefore increase the price of farm machinery?

Mr. VOSS: That is very true and, particularly, are we vulnerable in that regard now, in supplying the United States with as many machines as we are. We are strictly on a competitive basis. The answer to your question is definitely yes.

I think you might be interested to know—and some of you may remember—back in 1947 our company made a very determined effort and reduced prices over most of its lines, and put out a lot of publicity on it. Mr. Fowler McCormick's famous statement was that any price is too high if it can be reduced. At that time he was gambling, I think, probably that the inflationary trend would not continue. However, things have developed, and it has gone up each year, so everyone has forgotten all about it. However, it was a concerted effort to try and hold the line.

Mr. THOMAS: I have one other question. What is the capital used per employee in Canadian operations?

Mr. VOSS: To answer your question, assets employed in 1960 were \$12,500 per average of all the employees, not just factory but salaried, district offices and everyone. I think what you primarily had in mind, Mr. Thomas, was factory workers.

Mr. THOMAS: Well, not necessarily. I would prefer to have it cover all employees. I think it is a little simpler.

Mr. VOSS: Well, the figure is \$12,500. That is your over-all figure, and that is taken from the annual report.

Mr. RAPP: On page 8 of your brief you say that at your Hamilton works real estate and business taxes had increased 268 per cent. That is a terrific increase, and I should like to know was it due to the fact that your business went up or the volume of your real estate went up, or was it due to the increase in the mill rate in Hamilton?

Mr. GAY: It was an increase in the mill rate.

Mr. RAPP: Then this 268 per cent is actually not so much because your business went up but just because the Hamilton council had increased their mill rates. Did they go up three times from 1949?

Mr. GAY: About five years ago there was a major revaluation of the entire city of Hamilton but, as a result of that, I could not tell you how the value of our particular properties increased as a total percentage of the city of Hamilton.

Mr. VOSS: I was told by our treasury department that this had no relation to the volume of business which we were doing, and that the physical properties were identical.

Mr. GAY: There was also the business percentage of the real estate taxes.

Mr. MANDZIUK: Your assessment did not go up?

Mr. GAY: It could be there is no relationship to the volume of business.

Mr. RAPP: This is a pattern all over the country and not only at your plant. What I should like to stress is that it is not due to the fact that this is a manufacturing factory or plant. It is due to the increase in taxes and revaluation of assessment which has gone up all over the country.

Mr. VOSS: I think so.

Mr. FORBES: Mr. Chairman, I am going to be brief with my questions and, as they are to the point, I hope the answers will be the same. On page 6 of the brief you make reference to DBS figures in relation to the cost of farm equipment. Do these figures relate closely to your own figures of what it costs to manufacture, say, a particular machine?

Mr. VOSS: No, this is not cost; this is a pricing index. This has to do with retail prices, on page 6, and if I may ask: were you here this morning, sir?

Mr. FORBES: Yes.

Mr. VOSS: I explained then that we got the help of the DBS to establish our own price index. So far as we are concerned our office is geared on the same basis as theirs.

Mr. FORBES: Right. Do you have a breakdown of the cost of an H tractor, a combine and trailer?

Mr. VOSS: Following on your last meeting we had to get these figures very quickly. We felt you might be tempted to ask for a percentage breakdown of the cost of a combine, which we are going to give. We are also going to give you the cost of a baler and a manure spreader. You asked at the other meeting for figures regarding a wheeled tractor, which we do not have, but we are going to give you a breakdown for a number 9 field cultivator.

Mr. Chairman, we have those percentage figures here and we would be very happy to give them to you. Quite honestly, I thought that maybe they would mean something when we figured them out, but the only thing they are going to tell you is the ratio of labour and material and how that varies through the years—and it has not varied much. But, Mr. Chairman, if you would like us to, we would be happy to give you our figures.

Mr. MUIR (*Lisgar*): Are you doing it in percentages or dollars?

Mr. VOSS: In percentages. I hope you will not want us to publicly disclose the costs, and may I say for the record why. This is a really competitive, cut-throat industry. Take the case of balers—there is no business more competitive than the baler business. A lot of our competition comes from south of the border—from people who do not make those products in Canada. If we disclosed publicly what our cost was on this baler, it would be just like going into a poker game—I am not a poker man myself but I have seen it played—with the other players knowing all your cards. If they knew, for example, that you were selling this baler with a \$25 profit on it, do you know what they would do? They would say: "What is my cost? Gee, I will just cut mine down to \$50", and then Harvester are going to sell at a loss. So we all have our cards stacked in our favour. That would be so, gentlemen, if I gave you the cost; but I could, in confidence, if other people will do it—divulge the costs. We are not ashamed of them, but do not make us do it publicly, please.

Mr. FORBES: What does it cost you to build one of these machines? If we knew we would then be able to tell whether the manufacturer is making too much profit. If you want to answer at another time, that is fine.

Mr. MANDZIUK: I have a supplementary to that, Mr. Chairman. I realize the reason why Mr. Forbes asked that question, because there are groups of people who claim that profits of manufacturers of farm machinery have been going up, and a breakdown will help us decide whether or not that is the case.

Mr. VOSS: Well, sir, I can only come back to what I said before—our profits have been very modest. You see, in the over-all picture, as I have told you, our farm equipment profits were less than that. I will say this, that it is a tiny, little profit that we make on a machine. That percentage is related not to the retail price but to our wholesale factory price, as you know. That is not going to make any difference at all. You are talking about such a small amount. You are working on so little. Maybe our competitors have a margin—it might be well to ask and find out. If they have, I would pursue it, if I were in your position. But based on what I know about my business, in farmers' language, you are barking up the wrong tree, because the profit is not there. You can attack our efficiency and criticize me, our management, and our boys for not being more efficient, and I will take it and investigate every suggestion you have for increasing our efficiency; but an attack on the profit margin is not realistic or justified, because the profit margin is not there. You can tell that from our annual report. Your economists can tell you that. It is easy to say, "Well, there is a company which sold \$150 million worth of goods; we are suspicious of them because they have made too much money." I submit to you that if you would figure the average amount that a farmer spends for farm machinery and then figure out what you would consider was the right margin of profit—assume that it is two and a half—and then you would say that that is too high. How much are they entitled to have? Then figure that as a percentage of the retail price of equipment that this man is buying. You are not talking about any sum of money. You are talking about a few dollars, and that is all.

Mr. FORBES: This morning you made reference to a certain amount of piecework in your factory. Does that apply to assembly machines?

Mr. VOSS: Yes, sir, we have every operation we possibly can on piecework on an incentive basis, so a man is paid on the number of pieces he makes.

Mr. FORBES: That is fine. Now, how do you relate that to your hourly cost this morning, in the check you had?

Mr. VOSS: We took the total rates of payments we made for the year on all piecework and we took the hourly-rated people and the total number of hours, and divided by the actual number of hours worked.

Mr. FORBES: And that provided the hourly rate? Do you find that piecework reduces the cost?

Mr. VOSS: Yes, sir. There are abuses in the piecework system, as you all know, but by and large we believe in incentives.

Mr. FORBES: The next question is, what percentage of your machinery is sold in western Canada? Can you say that?

Mr. VOSS: We do not have those figures with us. When you say "west", you mean west of Ontario, of course?

Mr. FORBES: Yes, the prairie provinces.

Mr. VOSS: It is pretty near a saw-off.

Mr. FORBES: Could you give an approximate estimate at a later time?

Mr. VOSS: If it is really material, I will give the figure, yes. I would not think so—but if it is material to your inquiry, I will get it for you.

Mr. FORBES: These are some questions which I was asked by Mr. Jack Horner to ask here for him.

Mr. PASCOE: There are some other questions first.

The CHAIRMAN: Perhaps we could come back a little later to those, and would now give an opportunity to some others to ask questions.

Mr. DANFORTH: I would like to ask Mr. Voss three or four questions. We have had witnesses here from other companies who stated that in the process of their normal business they handle machines which they do not normally build but, because of the necessity to have a full line of equipment, they must fill their inventory with machines built by other companies. Is it a fact that International Harvester deal only with the equipment they themselves manufacture, or do they handle machinery for other companies?

Mr. VOSS: We have some machines that we sell which are made by outside people.

Mr. DANFORTH: I am not asking for any specific machine. I am dealing generally with the field.

Mr. VOSS: The answer is that we buy some machines on the outside, particularly if they are smaller volume machines where a smaller manufacturer might not have such a demand as we do, and would be better able to run a job shop operation than we could.

Mr. DANFORTH: Do these machines go under the "International" label, which is well known, or do they go under their own label?

Mr. VOSS: They go under our own label if it is designed on our side, but they go under that firm's label if it is their own model.

Mr. DANFORTH: You do some subcontract work with other manufacturers?

Mr. VOSS: Yes, but not as much in Canada at the moment as we normally would, because we have surplus capacity and we are keeping as much of it as possible in our own works.

Mr. DANFORTH: This committee is very interested in the manufacturing point of view. There are from time to time allegations that the farm machinery industry does tend to form a combine and does in effect work a price-fixing machinery, and you have stated previously that due to competition you do not seem to think this is feasible. I can understand that up to a point, but may I inquire this. I can understand, if you came out with a product when the offering price to the public was in excess of other companies, that you would then reduce your price to be competitive. I could understand that happening.

Mr. VOSS: Yes.

Mr. DANFORTH: But what I fail to understand is this. Each year new prices are brought out by machinery companies, and must be brought out far ahead of the actual machines appearing on the market. I fail to understand, in the last few years, while there has been an increase in every instance, how the increase between companies is almost approximately the same. The percentage increase is just about the same in every case, yet the machines have not even appeared on the market yet. There has not been competition, as the machine is not even on the market yet, and no prices are established for the year, yet between the machinery companies apparently the prices are comparable. How is that, if there is no price fixing?

Mr. VOSS: All I can say to that is that you can be very sure, and I can swear it under oath, and I am sure the others here would do so, also, that under no circumstances do we ever get together with our competitors and have a joint arrangement on prices. There is absolutely none, under any circumstances. I would not tolerate one of our people doing it, and I am sure they do not. If any of our competitors know of any new model that we have got coming out, they have got the information without our blessing. That is one of our trade secrets. We do not want anyone to know when we are coming out with a new model. We hide them. We test them under other colours than our normal one. It is real competition. There can be nothing more untrue than the inference that there is any conspiracy. And in particular that would be true in the case of new models, because this is a very competitive business.

Mr. DANFORTH: Supposing the committee is prepared to accept your statement in its entirety?

Mr. VOSS: Yes.

Mr. DANFORTH: Could you offer any explanation as to why this does in effect take place? I am sure you gentlemen are aware that it does take place, even more so than we; I mean that when the prices of all models go up each year, it is by an identical percentage. Can you offer some logical explanation for this which might satisfy the committee.

Mr. VOSS: Yes sir. I thought we had done so in our brief where we dealt with this under the category of how prices tended to keep in the same general area. For example, if we have a machine, and it does about the same work as one of our competitors' machines with the same output per hour, and the same general weight, and they are very similar, obviously the price range and differential between those two has to be very narrow, otherwise one of the two of us is not going to sell his product.

Mr. DANFORTH: I can understand how that would happen in the case of a machine which had been in production and had not changed very much. But I am thinking more of new models which come out. There were a number of new models which came out in 1961, and the machine dealers had the price lists, and there seemed to be very little difference in the prices. In other words—let me put it another way: the tractor of machine company A increased in price by X per cent. So did the new tractor of machine company B, and the new tractor of machine company C. They all seemed to go up in price at a comparable percentage. I wonder if you could offer a logical explanation as to why this should take place?

Mr. VOSS: I think as we said in here, whatever increase we have, the other people probably had too. If our prices went up, and the other companies did not have to increase the price at all, I would be very interested to know if they did not have the wage increase that we had. I would say that, percentage-wise, the amount of increase for all of us would be on a realistic basis, unless someone made a mistake, and that they would go up approximately at the same general

percentage; because I do not think there is a lot of difference between the wage increases that we have, and those which our competitors would be putting into effect in the course of a year. There might be a three or four months time lag, however.

But you see, in the case of this automatic wage increase, such as the one we had on April 22, we had known for some time that it was coming up, and it was contracted for. We knew last October, when we suggested our prices that this was coming up, and we legislated for it. The thing we did not know was how much production we should have, and whether we would be making a profit over the course of a year. You have to make an estimate. That is all you can do. In a market like this, you do not change your prices every day. You like to have the same stated company prices dealer-wise and customer-wise.

For your information, in setting up the cost of a machine in manufacture, it is pretty hard to get the cost right down to the last penny, and to estimate what your depreciation burden and overhead will be. You have to estimate what your actual production will be in the year, because that is what is going to determine what your actual cost is going to be for that year, in the final analysis.

Mr. DANFORTH: Am I to infer from your statement that in the graph which is presented for a new year there are certain basic costs that would be almost identical between the machine companies, in the labour field, the material field, and so on, and that that in itself would have something to do with uniformity in a price increase?

Mr. VOSS: Yes. If you are talking about tractors, for example I would hope that we would get as favourable a price from the tire companies as our competitors. We never know for sure; but I would be of the opinion that there would not be much difference between our cost. We buy a lot of components. I would hope our prices are as favourable as our competitors on bearings, chains and other things. For instance, let us assume we are talking about our first competitor "B". If we are making a baler, he would assume that probably our price of steel per pound would be about the same as his. There would not be much difference in it. We might have to go out on the market and buy a few odd pieces from a distributor rather than direct from the mill and might have a little re-rolling cost. In bearings, tires, wheels, springs, tubing, pipe, paint and things like that, I would say our costs would be very comparable.

Mr. DANFORTH: I just have two other very short questions and then I am prepared to pass. Is it possible, since the tractors are made in the United States, for a dealer under your franchise to act as an importer-wholesaler from the United States?

Mr. VOSS: Well, I presume it would be possible; but I do not think it would happen, for the reason that within a variation of a few dollars the prices would be about the same.

Mr. DANFORTH: I asked this question specifically. I suspect there are instances where dealers under an international franchise are importing tractors from the United States as wholesalers and, having a retail outlet, are charging a mark-up, both wholesale and retail, which in effect amounts to a double mark-up on the product.

Mr. VOSS: That is not possible; absolutely not. The dealer's cost and the retail price would be virtually comparable. You are talking about new tractors?

Mr. DANFORTH: Yes.

Mr. VOSS: That is not possible.

Mr. DANFORTH: I fail to understand this, because I think I can give you a specific instance where this is actually going on. Am I right in assuming that in your price you do give an f.o.b. list price to your dealers?

Mr. VOSS: We give a suggested retail price f.o.b. factory to our dealers.

Mr. DANFORTH: And in effect he can charge what he feels the market will bear.

Mr. VOSS: I do not know of any case where any of our dealers have charged more than that. It is a maximum price. He could sell for less.

Mr. DANFORTH: Is it possible for a dealer "A" to obtain your tractor, pay your price and resell? Within your competence have you any control over him if he wanted to sell at \$100, \$200 or \$250 over your suggested retail price?

Mr. VOSS: I think you have a fine legal point there. We never had it tested. I do not think it is a practical question, because to my knowledge I have not heard of it. If you have heard of such an example we would be prepared to run it down. I do not know what type of disciplinary action we could take. If it was affecting our business, we would have a talk with the dealer. It probably is within our control to do something about it; but I do not think that problem has arisen.

Mr. DANFORTH: There might be a difference of from \$100 to \$250 in the price of your tractor. I would be prepared to give you this information privately.

Mr. VOSS: I do not see how it can happen. Our price is the same to all dealers.

Mr. DOUCETT: No matter where they are, plus freight.

Mr. VOSS: Yes.

Mr. DOUCETT: Your wholesale price is the same?

Mr. VOSS: Yes.

Mr. DANFORTH: My proposition is that you have in effect both dealers paying the same to you but one dealer charges in excess, because he feels the market will bear it.

Mr. VOSS: Where is this territory? That is wonderful.

Mr. MANDZIUK: Maybe another dealer sells below the suggested price.

Mr. DANFORTH: That is possible.

Mr. VOSS: That is done every day. It is most unusual for a man to get the full retail cash price.

Mr. DANFORTH: That is the reason I am wondering why there is such a differential in the price of the same tractor within a distance of a few miles.

Mr. VOSS: The dealers have a vicious price cutting war in our industry. You know what tractors sell for and you know the dealer's discount and his mark-up. It is very possible there would be a \$200 differential.

Mr. DANFORTH: That is why I was interested in knowing why it is possible, since they are American built tractors, for a specific individual by acting as wholesaler and retailer have an independent mark-up?

Mr. VOSS: He would have to buy from a dealer there, and for all practical purposes that dealer would have the same cost as our dealer here.

Mr. DANFORTH: I am speaking of a man with an International Harvester franchise; he is not a dealer. He is buying direct from the factory.

Mr. VOSS: Then it would be through the Canadian district office. His contract provides that he would buy, if it is in your territory, from the London district office which supervises that territory. His order would go to the London district office.

Mr. DANFORTH: Do you have distributors over definite areas, so that tractors go to a distributor who in turn distributes these tractors?

Mr. VOSS: No. We have our own district offices, like yours at London which covers the Chatham area. We have only one class of dealer.

Mr. BRANNAN: I think this is a fair statement. An American factory of our would not accept an order from a Canadian dealer unless it came through an International Harvester district office in Canada. So he could not go to the factory to buy. He would have to buy from a United States dealer who would have the same margin he would have buying from us.

Mr. VOSS: In practice I have never heard of the situation you mention occurring. There are lots of opportunities for it; there is no fence across the border and no duty.

Mr. DANFORTH: Thank you, Mr. Chairman. Those are all my questions.

The CHAIRMAN: Gentlemen, it is past five o'clock. Is it the wish of the committee that we endeavour to finish our questioning of these gentlemen from International Harvester this afternoon?

Mr. DANFORTH: Some of us now have to sit in the house.

The CHAIRMAN: Mr. McIntosh, Mr. Cooper, Mr. Pascoe, and Mr. Forbes all have indicated they have questions. I am sure Mr. Voss would be quite anxious to finish up if possible. He has another engagement on Monday morning in Quebec. It would be at least Tuesday afternoon before we could meet again. If the committee will endeavour to maintain a quorum I think probably we can finish up within half an hour or so. Is that agreeable?

Agreed.

Mr. MCINTOSH: Mr. Voss, you made the statement this morning that you have three groups to consider—the shareholders, the employees and the customers. I would take it that from the customer's point of view you look after him in that order. The reason we are here, I presume, is because of customers' complaints that the price of machinery is going too high. In regard to the shareholders, I want to refer you to page 14 of the financial statement, and ask you this question, if it is fair to do so.

Mr. VOSS: Yes.

Mr. MCINTOSH: Did you say your shares were not on the market?

Mr. VOSS: No, they are not. The parent company's are, but not the Canadian subsidiary's.

Mr. MCINTOSH: Who holds your shares?

Mr. VOSS: The American parent company, International Harvester, in the United States.

Mr. MCINTOSH: Is the value of these shares exactly the same as it was, say, ten years ago, in 1951? I would like to have some columns on that chart.

Mr. VOSS: The par value would not have changed, but—

Mr. MCINTOSH: You have 150,000 at \$100 each?

Mr. VOSS: Yes, and that is \$15 million, and that is constant back to 1951; but, the retained earnings have increased, you see, from \$24.9 million in 1951, to \$41.7 million in 1960.

Mr. MCINTOSH: Look at the statement of income and retained earnings. How do you explain that in 1951 you paid \$2 million in cash dividends and, in 1960, you paid \$3½ million?

Mr. VOSS: 1960?

Mr. MCINTOSH: Yes, almost 80 per cent higher.

Mr. VOSS: And you are asking how do I explain it?

Mr. MCINTOSH: Yes.

Mr. VOSS: Well, over the period of years our dividends have run in the vicinity of 60 per cent of earnings, which I believe, for industry, is a generally accepted figure on pay-out. You normally figure a company should pay out about 60 per cent of earnings, and ours had been running below that, as you can see from prior years; we had been retaining money in the business to build and expand.

Mr. McINTOSH: But your net income in both these years was comparatively the same?

Mr. VOSS: Yes, we increased our dividend in 1960 and 1961. Our shareholders were hopeful we would, and we did so.

Mr. McINTOSH: Then, that 3 per cent you were talking about in dollars and cents does not mean the same thing that you are trying to say to us by way of percentage?

Mr. VOSS: Yes. We are talking net income up here.

Mr. McINTOSH: Let us take cash dividends, though.

Mr. VOSS: I do not relate the cash dividends as a percentage of sales. You can do that if you want to. In that case, cash dividends in 1960 were about 2 per cent of sales, but I do not think that is normally a fair comparison.

Mr. McINTOSH: Do you not think that the farmers decry the high cost of machinery as compared with the shareholder's income from the shares they hold and that there should be some comparison? It is almost doubled.

Mr. VOSS: No, I do not think that is relevant.

You can go back to 1954 and 1955 when the dividend was \$2 million and, based on capital invested and retained earnings—capital stock and retained earnings, in the amount of \$45 million, I would say it is a most inadequate return. It is about $4\frac{1}{2}$ per cent. You could do far better than that by investing in commonwealth bonds.

In 1955 there was a \$2 million dividend; add up your capital stock and retained earnings—and I would suggest you ought to put in it a provision for retirement benefits—that would mean that we have a total invested of \$52 million in the Canadian company as shareholders funds, and our dividend was \$2 million, which was a 4 per cent return. Considering the risk you have in this business, I think it is wholly inadequate. It would be far better to put it into government bonds.

To compensate for that, in the better years, when we were able to do so, we increased our dividend, and I think we were fully justified in doing so. We went over the 60 per cent of net income in 1960, in paying that dividend, but we had been under it in the past. If we average that out over a period of years, I do not think it is unreasonable.

Mr. McINTOSH: Again, taking the 9-year difference, 1960 as compared to 1951, I am interested in your figure for selling and administrative expenses. In 1960 you have \$15 million, and in 1951 you have \$7 million. Can you explain that?

Mr. VOSS: Yes. As I said, this is a total cost on motor trucks, construction equipment and farm equipment. I was not with this company in 1954, but Mr. Brannan was. However, I asked him this question yesterday—and I have asked this question many times: why? Selling expenses were very low in 1951, in 1952 as well. We did not really have to do any selling in that time. Machinery was in very short supply, and very little advertising was necessary. We had very few sales competitions, inducements and so forth, in order to sell our goods. I believe that is correct.

Mr. Brannan, you were sales manager of farm equipment at that time. Would you say that in 1951 people were taking things away from us? I think they probably were.

Mr. BRANNAN: Yes, it was still in the post-war period.

Mr. VOSS: Since that time the cost of advertising has doubled, and the cost of taxes has doubled. The cost of our salaries in the district offices has doubled, and that is the thing that worries me.

You see, gentlemen, the thing that bothers me is that in 1951 our sales were \$129 million. Our prices have gone up, but our total sales in 1960 were only \$156 million. However, our cost of selling that has doubled.

Mr. MCINTOSH: I am interested in the statement that your salaries in branch offices and so on have gone up. The reason I am interested is that I am sure when the labour congress come before us, we are going to get an altogether different picture about labour costs than we have at the present time. Comparing 1951 with 1960, have you fewer employees now putting out more units, although your cost of labour has increased 99 per cent. Has there been a shift from overall employment to the white-collared worker?

Mr. VOSS: You are talking about overall employees?

Mr. MCINTOSH: The ones that work in the shop, I would say.

Mr. VOSS: I would say they are relative. I am not too sure I got your question. You are talking about the ratio of salaried employees to factory employees within the works, are you? Yes, that ratio has remained pretty constant. It is 21 per cent, 21½ per cent and 23 per cent.

Mr. MCINTOSH: The relationship between the overall men and the white-collared men has remained pretty constant?

Mr. VOSS: Yes, within 5 per cent.

Mr. MCINTOSH: Then would you say that the statement that fewer employees at a similar cost to what the wages were ten years ago are putting out more units, is a false one?

Mr. VOSS: I think our productivity has gone up a little, as I said this morning. Yes, I think our productivity has gone up some. Now, it is very difficult to measure, and I wish I could measure that. However, I do not know how. The units change. If the units were constant, we could. As a rough, over-all guess, I suppose if you probably suggested that in our particular works in this industry, that our productivity has gone up 10 or 12 per cent, I would say I probably agree; on the other hand, if you said it was 15 per cent or only 8 per cent, I could not argue with you. But, what you are going to be confronted with—and this is a thing that bothers us—is that when you talk productivity in the United States, there is a generally accepted figure that industry, in general, uses, and that is a 2¼ per cent increase in productivity, compounded annually; and when you relate that to 1949 and 1960, as we did when we were making up this presentation, that would mean that our productivity should have gone up by 27½ per cent between 1949 and 1950, and, if we were perhaps in line with the generally accepted figure for industry over all, in the United States, that might be applicable. However, our opinion is that our productivity is very much less than that, and I think the Gordon report commented on the fact that productivity in Canada would be less than that 2¼ per cent, compounded annually. I think I can assure you, when you are confronted with that figure, as I am sure you will be, that I am not interested in what industry does overall. I am only concerned about the farm equipment industry and, in that, we have not got a high productivity rate because our production is too small to mechanize.

Mr. REGNIER: On page 33 of your brief you state that your net profit was approximately 3 per cent of sales in 1960. That would be after depreciation, I suppose?

Mr. VOSS: After what?

Mr. REGNIER: After depreciation.

Mr. VOSS: Yes.

Mr. REGNIER: What would be the percentage on the capital stock profit which, I understand, is \$15 million.

Mr. VOSS: Our retained earnings which we have not capitalized?

Mr. REGNIER: Retained earnings are also profits.

Mr. VOSS: They are previous years' profits which have not been distributed, and without which we could not continue in the business.

Mr. REGNIER: But the percentage would be very high on the capital stock?

Mr. VOSS: That money was put into the business probably 50 years ago, actually 57 years ago, and you are going back before my time. I do not know what it would buy then but it would certainly buy an awful lot less now.

Mr. REGNIER: Yes, but you have almost \$35 million or \$37 million of retained earnings which are also profits?

Mr. VOSS: That is true. These are earnings which have not been paid to the shareholders, which have been kept in the business and used to buy new equipment, new machine tools, to finance parts inventories, and build new district offices.

Mr. REGNIER: You have also what we call capital gains from your real estate.

Mr. VOSS: That is not in here.

Mr. REGNIER: Is a capital gain made by increasing the value of your real estate?

Mr. VOSS: Possibly not in factories. If you had to go out and sell a factory building you would find it is pretty hard merchandise to sell.

Mr. REGNIER: At the same time, you have about \$2 million of depreciation which you show as expenses?

Mr. VOSS: I believe we set that out separately. Yes, we have. There was \$2½ million accumulated depreciation. That is on real estate, on machine tools and so forth.

Mr. REGNIER: That has been going on for a number of years, I suppose?

Mr. VOSS: Yes. You can see on page 12 it is built up to a figure of \$27 million.

Mr. REGNIER: Eventually this will be translated into profits?

Mr. VOSS: No. It is a reserve for depreciation.

Mr. REGNIER: Or capital gains?

Mr. VOSS: No. I do not know how it could ever be a capital gain, unless we sold them and we have no intention of selling them.

Mr. REGNIER: Would you like to give us your percentage on capital investment?

Mr. VOSS: It is roughly in the vicinity of 8 per cent. Our capital investment, as you can see in 1960, is \$15 million, to which must be added \$41,756,000, and to that you would have to add the figure of \$4,109,867 which is the provision for the employees retirement benefits, for employees who have previously retired and where we have this pension liability. That is a total of \$60 million or, say, roughly \$61 million. Our net profit, after taxes, was \$4,713,000, which is a return on investment of about 7 per cent.

I would suggest to you if you had money to invest that you do not put it into the farm equipment business as you could only get 7 per cent return on your investment. Also, you are taking quite a risk and you can lose money in this business as well as make money. You would be a lot better off to invest your money in government bonds at the moment.

Mr. REGNIER: Of course many farmers live on their depreciation from machinery and buildings.

Mr. VOSS: We do not. We cannot pay factory workers their salaries on depreciation. There is no way we could do that.

The CHAIRMAN: Mr. McIntosh, I believe you had another question?

Mr. MCINTOSH: Yes. On page 17 of the brief you say that fast moving parts would cover a sizeable portion of the farmers' spare parts purchases, and as a result you have many competitors in the spare parts field. I was wondering if other competitors can make these component parts or spare parts as cheap, or perhaps cheaper than you can. If so, would it not be more advisable for you to purchase these parts from your competitors and thus bring the cost of your machinery down? I do not know how much it amounts to.

Mr. VOSS: You say would it not be advantageous for us to purchase these parts from our competitors?

Mr. MCINTOSH: If they can produce them cheaper than you can.

Mr. VOSS: I do not know if they can produce them cheaper than we can. It is possible that the people who would sell these parts to us would also be selling against us. That happens.

Mr. MCINTOSH: I am thinking of harrow teeth, disk blades and knife sections. I am not thinking of completed bearings.

Mr. VOSS: You are talking about a bread and butter line to our Hamilton works. We have recently taken on the manufacture of all knives and sections for the North American market in Hamilton. We make all the disk blades for North America in our Hamilton works, but I do not know what our costs are. I can give you this assurance, however, that we have a lot of competitors and we have to keep our prices down. In fact, I think we cannot buy them cheaper than we make them.

Mr. MCINTOSH: This morning you mentioned the component parts which you purchase, such as certain types of ball bearings and chains. You must have gone into the cost factor on those, otherwise you would not have made the statement which you did. Would you not make that statement on this other?

Mr. VOSS: I do not follow you.

Mr. MCINTOSH: In regard to these disk blades, harrow teeth, and so on, you say they are bread and butter, and bread and butter to me in business is something for which there is a good demand and in which there is a profit.

Mr. VOSS: Yes, there is a reasonable profit to us on those items.

Mr. MCINTOSH: I think that is my point.

Mr. CLERMONT: Mr. Chairman, I should like to join with the other members of the committee in complimenting the witness on the brief presented. I have only a few questions. On page 11 of the annual report there is provision for federal and provincial income taxes of \$4,300,000, and on page one you show for taxes—federal, provincial and local—\$12 million. Would the difference of \$8 million be for local taxes?

Mr. VOSS: This includes I believe, sales taxes on motor trucks and crawler tractors sold for construction purposes, as well as local taxes, and that amounts to quite a bit in our motor truck line.

Mr. CLERMONT: I think it was the last questioner who spoke about dividends. Are these dividends paid so much a share or do you say: "This year we will give them \$2 million and next year \$3 million." Do you do it prorata?

Mr. VOSS: Our Canadian board of directors meets every quarter and regularly looks at the dividend position and our profit position, and makes a decision on what, if any dividend can be paid. It has been reduced from what

it was in 1960. Normally we would pay our dividend quarterly, as is customary in our business, but the way business is going in 1961, dividends will not be \$3.5 million this year, and the quarterly rate has been reduced. I think in the past quarter our dividend to shareholders—I do not believe it needs to be kept secret from these gentlemen—is only \$500,000, and with four quarters, that would be paying dividends at the rate of \$2 million. We are in a cost-price squeeze, and I am not fooling. It is not paid on so much per share, however. It is a flat sum.

Mr. CLERMONT: The profit was never divided, or your parent company never drew on it, except the annual dividend?

Mr. VOSS: That is right, we have never paid capital to our parent company.

Mr. CLERMONT: My last question is—and I ask this question of every company—are you refinancing your sales of equipment? I read that you finance your dealers.

Mr. VOSS: Yes, we have a finance company that we have set up, and we finance or we floor, as you probably call it, machines for our dealers. We floor farm machines and motor trucks.

Mr. CLERMONT: What about consumers?

Mr. VOSS: The answer to that is that we finance very little for the consumer, for several reasons. First, we have not got the funds available so that we think we can not afford it—we are not broke either, do not get me wrong—and secondly, with the capable financing that most of our customers are able to get through F.I.L.A. at a very favourable rate of interest, 5 per cent, it has reduced the necessity for us to do so much financing for farmers. In that regard—if I can put in a plug for our farmer customers—I hope you will raise the \$7,500 restriction so that more of our farmer customers can take advantage of this lower interest rate. We finance very little paper and I think it is correct to say that it is less than 1 per cent of our sales.

Mr. CLERMONT: That will be the per annum interest?

Mr. VOSS: Mr. Brannan will answer.

Mr. BRANNAN: Mr. Voss is correct in saying that in 1959 and 1960 we steered all the possible retail paper to the F.I.L.A., and that has been our policy since its inception. But if a customer is not eligible under F.I.L.A. or has exceeded his quota under F.I.L.A., we will finance for him, and that varies slightly as between monthly payments. Broken down into annual payments, it amounts, in simple interest, to 10.5 per cent.

Mr. CLERMONT: Thank you, Mr. Chairman.

Mr. FORBES: May I ask a supplementary question on that same point? Mr. Voss suggested we increase the amount of \$7,500. Now it seems to me that the farm union indicated to us that their limit under the farm improvement loan is approximately \$3,000. You find you have customers who get the maximum loan to buy equipment?

Mr. VOSS: Yes, it is not unusual.

Mr. McINTOSH: On the manager's own word, without having permission from the head office?

Mr. BRANNAN: The statement was that everything over \$3,000 the bank manager had to refer to his superiors. That did not mean it would not be approved. Many times we have had the experience where people have purchased, if not up to the limit, certainly in excess of \$3,000.

Mr. COOPER: My question was answered by Mr. McIntosh, but we are having labour trouble here too. I know that one of the things they are going to say in their brief is that in this machine age companies are putting in machines that will take the place of four or five men. They will say that

companies are making money on these machines and throwing people out of work. What is the percentage of your labour force running the machines in the last 15 years as compared with now?

Mr. VOSS: I have answered this this morning, to the best of my ability. As I said, the only measure that I can see that is really realistic is the tons that you get in production of manpower that you pay for. Based on that, our productivity in our factories in this industry has gone up very slowly. I know it is possible by adding one machine to displace the labour of four or five men in some industries and on some jobs, and indeed on things we make if the volume were such that we could do so. If we were going to make 20,000 or 25,000 or 30,000 things, certainly we could afford to tool up and eliminate this labour cost. We do not do that. If you men are interested in investigating that, why do some of you not come down to see our works in Hamilton? We have mechanical engineers who will be very happy to show you how they work and how they would work if they had enough production, and what the cost of it would be. That would give you an idea of what we cannot do—what people in the automobile and rubber business have done. Some of you are farmers, and, for instance, a farmer might have 25 head of hogs and a hired man. In the last ten years the hired man's wages are doubled, and the farmer says he cannot afford it. A man will come and say: "If you spend \$5,000 for equipment you can mechanize the slopping of pigs." You say, "I cannot afford to do that, I have only 25 head of hogs." Maybe you can go out and buy 500 head of hogs and feed them with this one man. That is fine if you have a place to sell 500 hogs. We can do it on farm machinery if we could increase our production and if we had a place to sell it. The answer is, yes, we could do what you are talking about, but we have got to face reality and we have not the production to do it. If you are really interested in investigating this from the technical standpoint, the thing to do is to come to our factories and see for yourselves. We would be happy to show you at any time—all of you or a standing committee or otherwise.

Mr. COOPER: Another question was pretty well answered during the recess and that is: What do you do with the repair parts that you make that we cannot get? As I said, I have a small interest in an implement business, or my son has. My cultivator sat in the yard; I rigged it up and it sat in the yard for three weeks waiting for wheels. I ordered them before we started in the spring, but we had to rig it up to get it working. In the middle of the summer it broke down and three weeks later it still sat in the yard waiting for wheels. As you know, the blockman, Mr. Mel Fleming, picked up the wheels and axles.

Mr. VOSS: Mr. Brannan, do you know why we could not get it faster for him?

Mr. COOPER: I was raising hell all the time to get them.

Mr. VOSS: I would appreciate it if you could give me a note so we could get them for you. We do have a man who is in charge. He has not come here, but he probably has personal knowledge of the subject.

Mr. COOPER: I believe you were interested in having the farmers serviced.

Mr. VOSS: Yes, and we sell hundred of thousands of parts every year. We do our best to anticipate demand, but you know what happens; we are all human and we all make mistakes. Our dealers, sometimes, in going over the list of parts—and perhaps your son has done this also—accidentally and not on purpose, may overlook a part that should have been ordered. He should have ordered sections but he forgot to put it down and as a result the order comes in and they are short.

They are human, everyone makes mistakes, and our people could make a mistake.

Mr. PASCOE: I had some questions on the purchase of farm machinery, but I think they have been pretty well answered. I am very glad Mr. Voss expressed the opinion that the F.I.L.A. helped you to a considerable extent, especially since the government is putting \$100 million into the total. There is one question on page 6. It is in regard to labour costs. You say that in comparison with the period 1949 to 1960, the average has risen by 99.3 per cent. That is almost 100 per cent.

Mr. VOSS: Yes sir.

Mr. PASCOE: And that productivity per manhour had not gone up to the same extent?

Mr. VOSS: Yes.

Mr. PASCOE: I am just trying to find this out. Taking Stelco, the Steel Company of Canada, in their annual report they tried to get down to cost factors and they showed how much labour went into the production dollar, how much money went for labour and how much went for materials. Do you have a chart like that?

Mr. VOSS: We do not.

Mr. PASCOE: Do you have it to show the production dollar rate?

Mr. VOSS: We have this breakdown, and that will answer it in regard to the five machines that we have been discussing.

Mr. PASCOE: That will answer it?

Mr. VOSS: Yes.

The CHAIRMAN: Mr. Forbes, I believe you have some questions that Mr. Horner left with you. Have you many of them?

Mr. FORBES: I must say that they are most inquisitive. I will give them as rapidly as possible. On page 3 you mentioned a number of employees. How many employees has I.H.C. now? How many in Canada? Is 3,500 the total for all Canada?

Mr. VOSS: Our total employees in Canada as of today would be in the vicinity of between 6,400 and 6,500 employees. That is all lines.

Mr. FORBES: Next, could we have a breakdown of employees paid wages at union rates, and those paid salaries? How have these salaries increased or decreased over the years? What is the total payroll amount paid salary employees and amount paid hourly workers?

Mr. VOSS: I can pretty well answer that question for you. Let us put it this way. Most of our office people would be represented by unions. It is rather unusual, but that is true. The factory offices are represented by unions. You can say as a general rule that the salaries have gone up in line with the wage earners' wages. There would not be much in it. You are safe in assuming that. As for the number of salaried people, I could give that to you if I had it. I have it in Ottawa, but I do not think I have got it here now.

Mr. FORBES: Would you care to hand it in to the secretary and he could send it on?

Mr. VOSS: Are you thinking about the people in our farm equipment factory?

Mr. FORBES: I think that is what Mr. Horner had in mind.

Mr. VOSS: I will give you the average for 1960, and I think that will answer the question. The average for 1960 was 2,373 factory employees and wage earners; and 589 salaried. They are not all clerks and accountants—the salaried man can be an inspector and he can be the watchman and he can be the planning man and he can be the machine tool man, and he can be the foreman. It would not include janitors, as their rate would be an hourly rate.

They are not all clerks in that category, so do not think they are all accounting people.

Mr. FORBES: On page 4, what are the total sales for the past few years? What percentage of sales would be on the Canadian market? What percentage of the Canadian market does your company capture? How many 650 tractors would you sell in Canada in a year or over the past few years?

Mr. VOSS: Let us take those questions one at a time. What is the first?

Mr. FORBES: The total sales for the past few years.

Mr. VOSS: You have got that in the annual report. Probably Mr. Horner had not seen that.

Mr. FORBES: What percentage of your sales are on the Canadian market?

Mr. VOSS: That is on the record here. It is very close to it.

Mr. FORBES: What percentage of the Canadian market does your company capture?

Mr. VOSS: I would like to know the answer to that one. I do not know, sir.

Mr. FORBES: All right. On page 5, how have dealers increased or decreased over the past few years?

Mr. VOSS: We have just over 900 dealers. The general tendency is for the number of dealers to decrease as the number of farms has got less and the number of machines used has got less. As transportation has improved, as farmers are willing to go greater distances, the number of dealers has decreased.

Mr. FORBES: In your opinion, do fewer dealers with a larger stock of parts improve service?

Mr. VOSS: Well, up to a point, yes.

Mr. FORBES: Did automation in your opinion offset any raise in labour rates?

Mr. VOSS: I think that has been answered.

Mr. FORBES: Can we have a breakdown on the costs of material, labour and distribution?

Mr. VOSS: Yes, sir. You are getting those in these five machines.

Mr. FORBES: If taxes go up, is there a tendency to increase the cost of machines?

Mr. VOSS: Yes, sir.

Mr. FORBES: You are doing more in research and development now—is this true? Do you think the government should implement any further testing stations? It is something along the lines of the Nebraska test that he has in mind.

Mr. VOSS: We do not think it is necessary. We have every confidence in our testing procedures.

Mr. FORBES: In regard to page 10, you mention \$10,850 for advertising, for a page of advertisement. This seems pretty high and you refer to seven weekly farm papers. Is that correct?

Mr. VOSS: Yes, sir.

Mr. FORBES: What seven are they?

Mr. BRANNAN: *The Country Herald, The Country Guide, The Family Herald and Weekly Star, The Maritime Farmer, The Western Producer, The Free Press Prairie Farmer.* We are talking about farm magazines now, not talking about institutional magazines. There are magazines such as the *Farm Equipment Dealer* and *Canadian Farm Implements* which generally service the dealer trade. We do very little advertising in those publications. We have to put

our money where it counts and we want to reach the farmer. There are seven principal publications and I do not know how many minor ones. I have not got a list here, but you gentlemen all know these, I am sure.

Mr. FORBES: These were the questions that were handed to me. Mr. Jack Horner wanted to get these answers on the record. I will try and put them over as quickly as I can. Do you manufacture any machinery overseas?

Mr. VOSS: Yes, sir.

Mr. FORBES: How much or what is it? Everything?

Mr. VOSS: Yes, we have factories in England and Sweden. You are talking about the United States parent company now?

Mr. FORBES: Yes.

Mr. VOSS: They manufacture farm machinery in England, Sweden, Germany, France, Australia, Mexico. We are the world's largest manufacturers of farm equipment, as you men probably know—our parent company and all its subsidiaries.

Mr. FORBES: In what country are your largest sales manufactured?

Mr. VOSS: In the United States.

Mr. FORBES: What percentage of your total sales in Canada are parts? That is a pointed question, is it not?

Mr. VOSS: I have not got that information with me.

Mr. FORBES: Very well. Are prices the same in Canada, the United States of America and Great Britain?

Mr. VOSS: The prices in the United States and Canada are. You can say for practical purposes that they are the same. I forget the exchange variation, but you may say they are the same. In regard to Great Britain, they import very little because that is a low-cost producing area and the answer to that is that if the British company imported goods from here, those goods would sell for a higher price than they sell in Canada, because you have transportation, insurance and a lot of other things to consider.

Mr. FORBES: What percentage of production is combines, tractors or balers? Have you got that?

Mr. VOSS: No, sir, not broken down.

Mr. FORBES: This is the last question. Do you think that the more models of tractors the higher the prices of same seem to be?

Mr. MANDZIUK: That was given in answer to my questions, probably.

Mr. VOSS: I would say the answer is yes. If we could make only one model of tractor, why, the price would come down on that model. I can say yes. I am sure every farmer would love to have me standardize that particular size and model tractor which he particularly wants on his farm. If we could, that would be wonderful.

Mr. MANDZIUK: What does Mr. Voss have to say about the statement that the shareholders have put \$15 million into the company—that is all they have put in; suppose it was only one man—and reaped a return of \$3½ million a year, which comes to over 30 per cent?

Mr. VOSS: They originally invested \$15 million and they went for a long time with absolutely nothing on it. That ratio of earnings was over a period of 57 years.

Mr. MANDZIUK: It would have doubled their investment, which was not only excessive at the time, but also subsequently thereto. I am not asking for figures, but in respect to the salaried personnel from the lowest man you have to the top, may I ask if there has been a proportionate increase in their salaries?

Mr. VOSS: Mr. Brannan says not at the top.

Mr. MANDZIUK: I am not asking for figures, but their salaries have gone up?

Mr. VOSS: Yes, I am very safe in saying that they have gone up.

Mr. MANDZIUK: Does the company not feel that some of you gentlemen make more than the president of the United States?

Mr. VOSS: I would say that the top level salaries have not benefited as greatly as the lower level salaries have.

Mr. DANFORTH: I would like to have a statement from the witness, if possible. Do I have your permission?

The CHAIRMAN: A statement from whom?

Mr. DANFORTH: From Mr. Voss. Have I permission to ask a question?

The CHAIRMAN: We have been carrying on for some time, but go on and ask it.

Mr. DANFORTH: Mr. Voss, we understand how labour and material figures in your production cost, and that these costs are passed on to the farmers. But I would like to ask for your comment on this: do you feel that the costs of farm production or farm machinery in the future can be lowered by the utilization of machines for more than one specific purpose? I mean machines having more hours of work per machine? Take, for example, a four-tire conveyance that might be used for more than one specific purpose, such as a manure spreader, a forage grain box, or a combine that could be used to harvest small grain and corn? Have you conducted any research along that line, as to whether you could produce a piece of machinery that could be utilized for more than one purpose, because this would ultimately reduce the capital expenditure to the farmer?

Mr. VOSS: I suggest that there already is such a machine, applicable in the case of mixed farming, in the form of a combine which will thresh both corn and grain; and another in the form of our new self-propelled windrowers for both grain and hay, as well as for different field crops. I know that my own company has a windrower which eliminates the necessity of having a separate mowing machine, rake, and so on, because it does all these things in one operation. That is the trend. It is to make a machine do more than one thing. But there is one thing that a farmer does not like, and that is to have a reduction in the quality of the job that these machines are going to do. Farmers wish to produce a number one job, and this limits our ability to give them a universal machine. Our aim is to bring about a situation where there may be as few machines as possible.

Mr. DANFORTH: I take it that your machine company is conducting research or investigation towards this particular end, to reduce the capital cost to farmers?

Mr. VOSS: That is right. If we could reduce the cost to the farmer we would do it as quickly as we could, because it is the only way we can save the farmer. If we can help the farmer by reducing his costs through giving him a better and more universal machine, that is what we are out to do. I would like to do it, but it is something that cannot be done over night.

Mr. DANFORTH: Thank you.

The CHAIRMAN: I am sure that all the members of the committee wish me to express our appreciation to you and to the other members of your organization who have appeared before us and presented this very fine and concise brief. I may add that it was a very informative brief as well. We want to express our appreciation also of the fine manner in which you conducted the examination this afternoon, and answered the questions that were asked by members of the committee.

Mr. VOSS: Thank you.

The CHAIRMAN: Again, many thanks for appearing before us.

Gentlemen, the committee will now stand adjourned to meet on Monday morning at 9:30 a.m. in this room. The meeting will be in camera.

Clyde Lyons,
Clerk of the Committee.

ORDER OF REFERENCE

THURSDAY, May 18, 1961.

Ordered,—That the name of Mr. Slogan be substituted for that of Mr. Horner (*The Battlefords*) on the Standing Committee on Agriculture and Colonization.

Attest.

Léon-J. Raymond,
Clerk of the House.

MINUTES OF THE PROCEEDINGS

FRIDAY, May 19, 1961.

(18)

The Standing Committee on Agriculture and Colonization met at 9.40 a.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Argue, Badanai, Boulanger, Clancy, Cooper, Danforth, Doucett, Fane, Forbes, Hales, Henderson, Horner (*Acadia*), Horner (*Jasper-Edson*), Howe, Kindt, Knowles, Korchinski, McBain, Mandziuk, Milligan, Montgomery, Muir (*Lisgar*), Pascoe, Peters, Rapp, Régnier, Rompré, Slogan, Smallwood, Southam, Stefanson, Tucker, Villeneuve and Webb.—(34)

In attendance: From the Government of Saskatchewan: Hon. I. C. Nollet, Minister of Agriculture; Mr. J. T. Kyle, Director, Agricultural Machinery Administration and Mr. C. J. Wenaas, Economist, Economic Advisory and Planning Board.

Agreed,—to take the brief as read and print it in this day's Minutes of Proceedings and Evidence.

The Chairman introduced the representatives of the Government of Saskatchewan.

Hon. Mr. Nollet read a statement which condensed the information in the Government of Saskatchewan's brief.

The Committee questioned the officials of the Government of Saskatchewan on their brief.

At 11.00 a.m. the Committee adjourned until 2.30 p.m.

AFTERNOON SITTING

(19)

The Committee reconvened at 2.35 p.m. The Chairman, Mr. James A. McBain, presided.

Members present: Messrs. Argue, Boulanger, Clancy, Clermont, Cooper, Danforth, Fane, Forbes, Forgie, Gundlock, Hales, Henderson, Horner (*Acadia*), Horner (*Jasper-Edson*), Knowles, Korchinski, McBain, Mandziuk, Montgomery, Muir (*Lisgar*), Pascoe, Peters, Rapp, Régnier, Ricard, Rogers, Rompré, Slogan, Smallwood, Southam, Stefanson, Tardif, Thompson, Tucker, Villeneuve, and Webb.—(36)

In attendance: Same as at morning sitting.

The questioning of the officials of the Government of Saskatchewan was concluded.

Agreed,—That the Regulations under The Agricultural Machinery Act, 1958 of the Government of Saskatchewan be made an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix "A"*)

Agreed,—That an act respecting the Sale and Testing of Agricultural Machinery of the Government of Saskatchewan be made an appendix to this day's Minutes of Proceedings and Evidence. (*See Appendix "B"*)

On behalf of the Committee, the Chairman thanked the representatives of the Government of Saskatchewan for their appearance.

At 6.00 p.m. the Committee adjourned until Monday, May 22, at 9.30 a.m.

Clyde Lyons,
Clerk of the Committee.

EVIDENCE

FRIDAY, May 19, 1961.

The CHAIRMAN: Gentlemen, we have a quorum with us this morning. We have here this morning representatives from the government of Saskatchewan in the person of the honourable I. C. Nollet, the minister of agriculture, who is on my right. Sitting next to him is Mr. J. T. Kyle, director of agriculture, who is also agricultural machinery administrator. On the corner is Mr. Wenaas, the economist to the economic advisory and planning board.

Gentlemen, this morning your brief, as you no doubt know, is quite lengthy. We hope many of you will have had the opportunity to read it quite thoroughly as it has been in your hands for some time. Would it be agreeable to accept this brief as read, so that it will be in today's proceedings?

Mr. HORNER (*Acadia*): Before this is agreed to, may I ask if we can put questions? If it is to be included in the committee's proceedings, can we ask questions on any part of the brief?

The CHAIRMAN: Mr. Nollet has a condensed statement to make on the brief. If we accept the brief as read, we can then take it and questions can be asked section by section. Is it agreed now that the brief be taken as read and inserted in today's proceedings?

Agreed.

(Editor's Note: The brief, to which reference is made, is as follows:)

SECTION I

FARM MECHANIZATION

The Nature of the Problem

We very much appreciate the opportunity to make this submission regarding farm machinery prices. We trust that our statement will make a useful contribution to the deliberations of the committee and assist in arriving at recommendations that will be of benefit to Canadian agriculture and thus of benefit to the Canadian economy as a whole.

The advances in agricultural mechanization in Canada are familiar enough. In less than half a century farming has been transformed from an industry in which there was almost complete reliance on animal and human power to one in which the need for animal power has been practically eliminated in wide sectors and human labour plays a much less significant role. The very heavy investment in farm machinery involved in this development has brought about profound changes in the composition of farm costs. Canadian agriculture is more vulnerable than ever before to the level of farm machinery prices. At the same time since mechanization brings about an increased inflexibility of farm costs, Canadian agriculture is also more vulnerable to any decline in the price levels of farm products. It is thus by no means accidental that so much anxious attention has been concentrated on the farm price-cost squeeze.

In our view, one must consider the question of farm machinery prices in this economic setting of the increasing disparity between farm product prices and farm costs generally that has been true of the last decade. For instance, the index of farm prices of agricultural products in Saskatchewan has dropped

14 per cent since 1948 (on basis of estimated final grain prices for 1960) while the composite index of farm costs for western Canada (exclusive of living component) has climbed by 43 per cent. It is true that farm prices generally rose from 1948 to 1951 (with the most important exception being wheat) but even during those years farm costs rose faster and have continued to rise while farm prices have fallen since 1951. Steadily and inexorably this price-cost vise has been tightening (see table 1).

But for Saskatchewan agriculture the problem assumes more critical proportions since the price of wheat, the most important single commodity in the provincial agricultural economy, did not rise even in the 1946-51 period when most other farm products did show price increases (see table A-1, appendix A). Thus the relationship between wheat prices and farm costs has changed even more than the general index of farm prices would indicate.

TABLE 1
FARM PRICE AND COST LEVELS, SASKATCHEWAN, 1945-1960

	Index of Farm Prices of Agricultural Products, Saskatchewan	Complete Index of Farms Costs, Exclusive of Living Component, Western Canada
	(1945 = 100) ¹	(1945 = 100) ¹
1945.....	100.0	100.0
1946.....	112.8	103.4
1947.....	117.4	111.7
1948.....	128.3	128.0
1949.....	129.2	134.1
1950.....	130.6	139.3
1951.....	139.5	151.7

1959.....	113.4 ²	178.9
1960.....	112.7 ²	182.6

Source: D.B.S. Index Numbers of Farm Prices of Agricultural Products; D.B.S. Price Index Numbers of Commodities and Services used by farmers.

¹ 1935-1939 = 100 converted to 1945 base.

² Based on estimated interim and final payments for wheat of 22 cents for the crop years 1959-60 and 1960-61 and estimated final payments of 8 cents per bushel for barley for the crop years 1959-60 and 1960-61 and 9 cents per bushel for oats for the crop year 1960-61.

Then, too, farm machinery prices have risen more rapidly than other farm costs, so that the relationship between wheat prices and farm machinery prices has registered a truly phenomenal change (see table 2). Thus, while the general indices of farm prices and farm costs in the province indicate that a unit of farm production was worth, in terms of general farm costs, only 60 per cent in 1960 of what it was in 1945, a bushel of wheat in 1960 (assuming interim and final payment of 22 cents per bushel for 1960-61 crop year) will buy only 38 per cent of what it would buy in 1945 in terms of farm machinery. In other words, if it took 1,000 bushels of wheat in 1945 to buy a unit of farm machinery it would on this basis require 2,600 bushels of wheat to buy the equivalent unit in 1960.

SOURCE: D.B.S. Price Index Numbers of Commodities and Services Used by Farmers 1913 to 1948. The 1935-39 index has been converted to the 1945 base.

¹ It should be noted that the index of farm machinery prices based as it is on a 1938 survey of farmer's operating costs has been left behind by the pace of technological change in agriculture. For instance, binders are given one-eighth of the total weight of the western Canadian index, fully as much as tractors. Combines are given a very low weight (2 out of 78.5 points) and only one-sixth of that of mowers.

Furthermore, unless there is decisive action by the federal government, the prospects are for continued deterioration in this ratio. There seems little prospect of prices for wheat, or indeed of almost any farm product, showing a significant and sustained upward trend in the foreseeable future. On the other hand, farm machinery prices and farm costs generally show every sign of continuing to increase. Moreover, since in all but one year since 1948 farm machinery prices have been increasing faster than general farm costs, it is likely that this too will be a trend in the future (see table A-2, appendix A).

Of course, it seems quite clear that had the prices of farm products advanced in common with other prices in the Canadian economy, increases in farm costs and more specifically in farm machinery prices would not have constituted the heavy burden that they do today. The essential problem, in our view, is that agriculture is one of the few remaining competitive areas in the economy facing an array of monopolistic or price-administered industries, and therefore its bargaining position in the market is weak. For instance, even though agriculture has shown in the post-war period the most rapid increase in productivity of any sector of the Canadian economy,¹ farm income has lagged behind that of the rest of the nation because farmers have very little control over the selling prices of their products. Thus, although any farm machinery price reductions would have important benefits, they would not be fully realized unless fundamental marketing adjustments and pricing policies are adopted by the federal government to enable agriculture to obtain a fair share of the national income. We have urged the adoption of such policies on numerous occasions although we are not repeating them in detail now since the committee is directing its attention specifically to the question of farm machinery prices.

Before considering the possible avenues along which farm machinery costs might be reduced, we feel it would be appropriate to review briefly the pattern

¹ The Canadian Bank of Commerce, August 14, 1959.

of mechanization in Canada and in Saskatchewan and to indicate the critical stage at which we believe this now stands in the prairie provinces and particularly in Saskatchewan as a result of depressed farm income.

Patterns of Farm Mechanization

The growing extent of farm mechanization is shown in the increase in the total capital invested in farm machinery, in the increased proportion farm implement capital now bears to total farm capital, in the increased number of farm implements per farm unit and per member of the farm labour force and in increased agricultural production capability in spite of a reduction in the farm labour force.

Investment in farm implements and machinery in Canada has increased more than three-fold in actual dollar values since 1921, and from 10 per cent of total farm capital in 1921 to 19 per cent in 1959. The same trend is apparent for Saskatchewan (see Table 3).

TABLE 3

1941.....	596	143	14.1	15.9
1951.....	1,933	526	20.4	26.4
1959.....	2,189	517	19.3	22.9

SOURCE: 1911-1951—D.B.S., Census of Canada; 1959—D.B.S. Quarterly Bulletin of Agricultural Statistics.

¹ In all years except 1921, value of farm implements and machinery includes value of automobiles.

It is well-known that the number of farm tractors, grain combines and motor vehicles has increased greatly in the past 25 years, (see tables A-3 and A-4, appendix A) while the number of farms and the agricultural labour force has declined. The number of various farm implements (motor trucks, tractors and grain combines) and also the total value of farm implements in relation to the agricultural labour force is higher in Saskatchewan than for any other province (see table A-5, appendix A). Similarly the percentage of farms reporting these farm implements is highest in Saskatchewan (see table A-6, appendix A). In addition, the ratio of the value of farm implements and machinery to the value of total farm capital was higher in 1951 for Saskatchewan than for any other province although by 1959 it had slipped slightly below that of Manitoba (see table A-7, appendix A).

Nevertheless, although it may be said on this basis that Saskatchewan agriculture has a paramount interest in farm machinery prices, we recognize that in recent years the pace of farm mechanization particularly in provinces like Ontario and Quebec has been greater than in Saskatchewan (see table A-8, appendix A). This means that there is a much wider common interest among farmers throughout Canada than has been the case in the past. This is indicated by the similarity of comments being made by farm groups in the Atlantic provinces, Ontario and Quebec to those made by farm groups in Saskatchewan

or the other Prairie provinces. Therefore, we believe that much we will have to say will have general application even though we may be referring specifically to Saskatchewan examples. Although different types of machines may be used in different sectors of agriculture we suggest that there are certain cost principles that are common to all.

Impact of Farm Machinery Prices on Farm Costs

We have already pointed out the rather alarming fact that, during the very period agriculture was becoming most vulnerable to the level of farm machinery prices, farm machinery prices have been increasing more rapidly than other farm costs. The index of farm machinery prices has more than doubled since the end of the war climbing particularly sharply from 1947 to 1951, continuing to rise from 1952 to 1955 but at a rate of less than one per cent a year and resuming a more rapid upward advance in 1956 although at a rate somewhat below that of the 1947-51 period (see table 4).

TABLE 4

¹ 1935-39 = 100 converted to 1945 base.

It may be represented before this committee that although a farm machine may cost more today it is more efficient than the machine produced fifteen years ago and that this compensates to a very great extent for higher prices. Certainly some increase in efficiency has taken place although we doubt whether anyone could establish beyond dispute the extent of such an increase. However, to avoid such a controversy our agricultural machinery administration has selected farm machines that have been changed only slightly (only in features such as different bearings, etc.) over a period of some years and made price comparisons of these machines (see table 5). This confirms the view that farm machinery prices have increased substantially, price increases that cannot be explained away as being due to better machinery.

TABLE 5
PRICE INCREASES IN UNCHANGED FARM MACHINES
(f.o.b. factory)

Name and Type of Machine	List Prices in Years Indicated	Price Increase		Same Period Increase in Index of Farm Prices, Western Canada
		%	%

John Deere Cultivator (Tool Carrier)...	Year: 1953; 1960 Price: \$293; \$380	30		28

SOURCE: Company price lists.

In most cases these unchanged machines have shown a price increase greater than the increase in the D.B.S. index of farm machinery prices in the same period suggesting that the index may be minimizing the actual price increases taking place. It is widely recognized that this index is seriously out of date based as it is on farm machinery use in 1938, and we welcome the information that a new index based on much more recent data is now being prepared. In this connection we would urge that the dominion bureau of statistics give consideration to a regular decennial revision of the farm machinery price index.

Similarly a number of repair parts were selected that have not been changed in basic design. Again we obtain the same results: very considerable price increases in some cases exceeding by a wide margin the increase in the index of farm machinery prices for the same period (see table 6).

We now turn to the impact of these higher farm machinery prices on farm costs. This is difficult to measure precisely because both increased mechanization and higher farm machinery prices have operated since the end of World War II to increase expenditures on farm machinery. The tripling of farm machinery depreciation costs in Saskatchewan from \$22 million in 1945 to the peak of \$67 million in 1954 must obviously be due to both factors. During the same period, farm machinery operating costs doubled from \$47 million to \$98 million also a reflection of increased mechanization and of the more moderate increases in fuel prices. Since that time due to reduced farm machinery purchases, the value of farm implements and equipment in Saskatchewan has

TABLE 6

PRICE INCREASES IN UNCHANGED FARM MACHINE REPAIR PARTS

SOURCE: Company price lists.

declined and therefore machinery depreciation charges have also been reduced while machinery operating expenditures have continued to increase (see table A-9, appendix A).

This has considerably increased the proportion of total farm costs going to meet farm machinery expenses. From somewhat under 45 per cent in the 1945-49 period this has risen to over 55 per cent in the 1955-59 period (see table 7). But even more significant is the sharp increase in the percentage of farm cash income required to meet the farm machinery bill, an increase from under one-fifth in the immediate post-war period to almost a third in the most recent period (see table 7). At the same time other farm costs have absorbed about the same proportion of farm cash income throughout the period so that total farm operating and depreciation charges have been taking a larger and larger share of gross cash income.

Of the various components of farm operating costs in Saskatchewan, costs associated with land and buildings have gone up only moderately while payments to hired labour have remained relatively stable throughout the 1945-1959 period (see table A-10, appendix A).

The important place of farm machinery costs is also emphasized by the 1959 *Saskatchewan Farm Business Summary*¹ which provides a detailed cost and income analysis of 455 Saskatchewan farmers organized in 42 farm management clubs. This indicates that in 1959 farm machinery costs amounted to 33 per cent of cash operating receipts which compares to an estimated 32 per cent of farm cash income for the same year estimated by the dominion bureau of statistics (see table A-9, appendix A). It should be noted that an allowance

¹Extension Report No. 2, Part 2, published by farm management division, agriculture representative branch, department of Agriculture, province of Saskatchewan.

SOURCE: See Table A-9, Appendix A.

of a five per cent return on investment was included in the *Farm Business Summary's* calculations of farm machinery costs while this is not included in the D.B.S. estimate. In addition, a five per cent return on other farm investment was included in total farm operating costs as was a farm operators' wage allowance and an allowance for unpaid family labour.

This study indicates that the proportion of farm machinery costs to total costs tends to rise as farm size increases up to 1120 acres and then remains stable (see table 8). In actual terms farm machinery costs per cultivated acre have showed a continuous decline as farms have increased in size.

TABLE 8
FARM MACHINERY COSTS IN RELATION TO TOTAL FARM OPERATING COSTS,
BY SIZE OF FARM, SASKATCHEWAN

SOURCE: 1959 *Saskatchewan Farm Business Summary* extension report No. 2, part 2, tables V, VI and VII.

Perhaps the effect of farm machinery price increases can be most clearly demonstrated by relating sales of new farm machinery and equipment to that portion of farm cash income that may be deemed to be "available" for farm machinery purchases. "Available" farm cash income has been assumed to be cash income from farm products less farm operating expenses¹.

The value in both current dollars and constant (1945) dollars of sales of farm machinery in Saskatchewan increased every year with only one exception from 1945 to 1953. The sharp decline of "available" farm cash income in 1954 and the continued decline in 1955 led to a similarly sharp decline in farm machinery purchases in those years but farm machinery sales in current dollars continued to absorb almost as high a percentage of "available" farm cash income as during the preceding period (see table 9). Again in 1959, the share of "available" farm cash income being spent on farm machinery had risen to pre-1954 levels but it was not sufficient, as will be indicated in the next section, to prevent a continuing decline in the value of the stock of farm implements. The notable factor is that in terms of constant (1945) dollars retail sales of farm implements and equipment since 1954 have been consistently at end of war levels.

The State of Capital Investment in Farm Implements

Of critical importance to the welfare of agriculture is the condition of its capital equipment. As we have already suggested this is more significant today than it has ever been because of increased mechanization. Therefore, it is particularly alarming to see that since 1954 under the impact of sharply reduced farm income and rising farm costs there has been a very considerable deterioration in the condition of farm implements and equipment in western Canada (see table 10). This is a reflection of sharply reduced purchases of farm implements by farmers who have had to postpone replacing their farm implements. It has been necessary for them to spend income on operating expenses or on family living expenses which should have been allocated to capital account.

In just five years from 1954 to 1959, the estimated value of the stock of farm implements has fallen by \$166 million for the prairie provinces and \$93 million for Saskatchewan alone. In other words Saskatchewan farmers have been forced to use almost \$100 million of their capital in order to maintain current expenditures. Moreover, this does not take into account the levels to which investment in farm implements and equipment might have risen in the absence of adverse economic circumstances nor is there any allowance made for the continuing increase in farm machinery prices. Therefore if it were possible to measure in terms of dollars the setback to farm mechanization in the western provinces occasioned by the price-cost squeeze, it should be considerably larger than the amounts indicated.

Highlighting and corroborating the decline in the value of farm implements and equipment in the prairie provinces are studies we have conducted of the average age of tractors and combines on the farm in Saskatchewan and in the prairie provinces as a whole. Tractors and combines make up the two largest single components of farm implement sales.

These studies show a marked increase in the average age of tractors and combines in the past four years. The estimated average age of tractors in the prairie provinces has climbed from 6.3 years in 1956 to 8.5 years in 1960 (see

¹ Farm family living expenses should also be deducted but there are formidable difficulties in estimating them. In addition, in doing so, it would be necessary to make some allowance for non-farm income such as family allowances. Supplementary payments such as P.F.A.A. have also been excluded from "available" farm cash income since the attempt is being made to relate farm machinery purchases to income derived directly from agriculture. In any event, the inclusion of P.F.A.A. payments would not affect the results to any significant extent.

¹ Includes farm trucks and automobiles.

appendix C). For tractors in Saskatchewan the estimated average age has increased from 7.5 years in 1956 to 9.5 years in 1960 (see appendix B). At June 1, 1960, in the prairie provinces it is estimated that over a third of the tractors were eleven or more years old while for Saskatchewan an estimated

45 per cent of the tractors were eleven or more years old and less than 20 per cent were five years old or less. When set off against the estimated average life of tractors of 14 years¹ this gives a clear indication that a great many tractors should be replaced within the very near future.

The same disturbing situation exists in combines. Between 1956 and 1960 the average age of combines in the prairie provinces increased from 6.4 years to 9.0 years while those in Saskatchewan increased from 7.9 years to 9.7 years (see appendices D and E). Indeed, this study indicates that the average age of combines in Saskatchewan will stand at 10.1 years at June 1, 1961, while that in the prairie provinces will have increased to 9.5 years. Similarly at June 1, 1961, 41 per cent of the combines in the prairie provinces will be 11 years old or over while for Saskatchewan 45 per cent will be 11 years old or over. This compares with an estimated average life of 10 to 11 years for combines.² Only about 18 per cent of the combines in the prairie provinces and 15 per cent of the combines in Saskatchewan will be 5 years old or less.

We may verify these conclusions by considering the average annual sales of tractors and combines in the past four years in relation to the stock of tractors and combines on the farm in 1956. If annual sales were to remain at this level in the future it would take 27 years before the 1956 stock of tractors in Saskatchewan would be replaced and 30 years in the case of combines (see table 11). The comparable figures for the prairie provinces are 26 years in the case of tractors and 24 years in the case of combines. When compared to the estimated average life of these machines, it is apparent that sales are very much below replacement levels.

¹ Annual sales estimated on basis census year June 1-May 31.

Clearly unless farm machinery sales rise very considerably above present levels the farmers' stock of equipment will continue to deteriorate. At some time in the not too distant future, sales must make up for the reduction in investment that has taken place in the last few years. The trend in farm machinery prices indicates that the longer this is postponed the greater will be the replacement cost to Canadian agriculture. At the present time the conjuncture of economic circumstances makes the question of farm machinery prices one of urgent concern not only to agriculture but to the Canadian economy as a whole.

¹ M. K. Scott, *Farm Power and Machinery Costs in Alberta, 1950*, Economics Division, Canada Department of Agriculture, Ottawa, 1952.

² *Ibid.*

Possible Reductions in Farm Machinery Costs

We believe that there are five principal areas in which reductions in farm machinery costs might take place, at the manufacturing level, in transportation, in distribution, in the realm of credit costs and then once in the farmers' hands in the degree of efficiency with which the machine is employed and its suitability and durability. We have not attempted to go into the question of the factors that enter into the costs of the materials used in manufacturing since this would require an analysis of the whole economy. It must also be understood that it has not been possible to make as thorough and detailed a study as we would like so that it has been necessary to deal sketchily or not at all with some problems that are of concern.

SECTION II

FACTORY PRICES OF FARM MACHINERY

The government of Saskatchewan has not had access to the detailed information that would be necessary to determine whether the factory prices of farm machinery are justified by the costs of manufacture since almost the entire Canadian farm implement industry is situated in Ontario. The problems that this fact has posed are indicated by the experience of the special committee of the Saskatchewan legislature set up in 1952 to consider farm machinery prices. This committee sought to obtain from farm machinery companies the kind of cost breakdown necessary to a thorough analysis of manufacturing costs, but the companies refused to supply the necessary information. Furthermore, since the companies were beyond the jurisdiction of the province of Saskatchewan, the legislative committee could not require company witnesses to appear before it so that this aspect of the committee's study was made impossible to complete. Therefore we would strongly urge this committee to use its wider authority to require the farm machinery companies to supply such cost data.

In the absence of such information regarding present-day manufacturing costs, we would like to make certain observations and recommendations based on evidence submitted to, and conclusions of, other legislative committees both in Canada and the United States and on studies and observations of the agricultural machinery administration in Saskatchewan. In addition, we shall refer to an analysis that we have made of the annual financial statements of two farm machinery companies which brings up to date a study that was authorized by the special committee on farm implements of the Saskatchewan legislature in 1952.

The Nature of Farm Machinery Manufacturing

There is little question that the farm machinery industry is dominated by a few firms and that this offers farm implement companies abundant opportunities to charge unreasonably high prices. Every study that has been made of the industry has provided testimony for this view. For instance, the 1937 House of Commons committee on farm implement prices concluded in its report that:

The lack of free price competition in this industry (the farm machinery industry) as in many other industries, is one of the real problems in modern economic life. From the standpoint of the business executives, free price competition was not a satisfactory condition and escape from it was one of the salient reasons for the formation of large corporate units by amalgamation of smaller previously existing

companies. From the consumer's standpoint, however, it is apparent that this has resulted in higher and less flexible prices for the commodities which he has to purchase.¹

The Committee found that:

The four major companies to which the committee has directed its attention have thus supplied between them approximately three-quarters of the farmers' needs in respect to farm implements and machines and parts therefor, in the ten-year period ending in 1935.²

It was found that International Harvester Company alone obtained one-third of total sales.

The conclusions of United States committees are relevant too since Canadian agriculture is heavily dependent on United States sources for many farm implements. The U. S. House of Representatives small business committee in its study entitled *United States versus Economic Concentration and Monopoly* found that: "Concentration is marked in the agricultural machinery industry as evidenced, for example, by the recurring federal trade commission investigations.³ It indicated that the four largest companies handled 84 per cent of all tractor shipments in the first quarter of 1945 and the eight largest companies accounted for 97 per cent. There was relatively less concentration in respect of other farm implements with the largest four companies accounting for 40 per cent of all the shipments of agricultural machinery in the first quarter of 1945 according to the committee report.

The report of the United States federal trade commission on manufacture and distribution of farm implements in 1948 dealt at some length with the matter of industrial concentration. It indicated that:

Each of the present important long-line farm machinery companies is the combined result of acquisitions and mergers and of the development of new items of equipment within the lines of the different companies

and added,

... as the big companies have grown to their present stature, the number of manufacturers of shorter lines has steadily dwindled.⁴

It referred to two distinct phases of consolidation, stating:

The first occurred just after 1900 and was characterized by monopolistic combinations under single corporate control of the principal companies previously making particular lines of implements... This type of combination effectively eliminated competition among the companies merged and placed them in such a dominant position that no single independent company would be financially able to survive a serious competitive struggle with the combination.⁵

Then, the United States federal trade commission reported that the second phase consisted of lengthening the lines of implements supplied by these great combinations and then insisting that their dealers do not handle competing manufacturer's machines.

¹ Minutes and Proceedings of Evidence, Special House of Commons Committee on Farm Implement Prices, 1937, p. 1264.

² Ibid, p. 1219.

³ *United States versus Economic Concentration and Monopoly*, Report of United States House of Representatives Small Business Committee, 1946, p. 116.

⁴ Report of the United States Federal Trade Commission on Manufacture and Distribution of Farm Implements, 1948, p. 2.

⁵ Ibid, p. 33.

The report indicated that:

This in turn made it increasingly difficult for even the strongest short-line companies remaining in the trade to obtain competent dealers. Lacking volume to support wide distribution of their own, many well-known short-line companies either sold their plants and businesses to the big companies or went out of the business altogether either through bankruptcy route or by shifting to other lines.¹

The indications are that the farm machinery industry is no less concentrated today than in the immediate post-war period. Indeed the merger of two second rank United States farm machinery companies in 1951 would suggest that the process of consolidation and concentration has by no means come to an end. The Canadian farm machinery industry is even more highly concentrated as is typical of almost any Canadian manufacturing industry when compared with its United States counterparts. For instance, in 1958, five establishments produced 84 per cent by value of factory shipments in Canada.²

Agriculture is one of the very few productive industries in Canada that finds itself unable to bargain effectively for the capital goods upon which it depends. Most other goods-producing industries are themselves dominated by a few firms and so are able to negotiate to some purpose for price reductions in the capital goods they require.³ Agriculture almost alone among the sectors of production requires special measures to assure it from being exploited by the powerful agents with which it must deal. We will suggest a number of means that might be adopted to do this.

First of all, we would not recommend the breaking up into smaller units of the large farm machinery companies. There is every indication reinforced by the 1948 report of the United States federal trade commission on farm implements that the consolidations of the industry involved substantial economies in production and eliminated considerable waste in competitive trade practices. Our aim is not to undo the steps that have been taken to reduce the costs of production but is to assure agriculture that it will not be exploited by the increased bargaining power of an industry on which it is so dependent and that it will be able to obtain more of the benefits of the savings accruing to the farm machinery industry.

Profit Levels in the Industry

There is considerable evidence to indicate that the farm machinery companies have used their position to exact a high tribute from time to time in the past. This view won support in 1937 from the special House of Commons committee on farm machinery prices which declared as one of its findings that the price of farm machinery has been unjustifiably high over the preceding quarter-century.

Similarly the special committee on farm implements of the Saskatchewan legislature found that:

Evidence submitted to the committee indicated that the manufacturing companies have made very high profits in the past few years and particularly since the removal of price controls in 1947.⁴

¹ Ibid, p. 34.

² Source: D.B.S., *The Agricultural Implements Industry*, 1958. The breakdown by value of factory shipments is given by establishments and not by companies. Indications are that these five establishments are owned by three or four companies.

³ J. K. Galbraith, *American Capitalism, The Concept of Countervailing Power*, Houghton Mifflin Publishing Co., 1952.

⁴ Report of the Special Committee on Farm Implements, Legislature of Saskatchewan, 1952. p. 35.

As an illustration of the profit position in the farm implement field, statements of earnings and dividends were prepared of two firms which make up a large proportion of Canadian production and sales of farm implements, namely the Cockshutt Farm Implement Company and the Massey-Ferguson Company. These are based upon the published financial reports of the companies and may be found in appendix F.

These indicate that since 1946 there have been two distinct periods as far as profitability is concerned and that there have been considerable differences in the rate of earnings between Cockshutt Farm Equipment Limited and its considerably larger competitor, Massey-Fergusson Limited. (An analysis of the gross operating profit of the Canadian farm implement industry is also available in table F-7, appendix F.)

From 1947 when price controls were lifted to 1952 the earnings of these companies were to say the least remarkable. The return before taxes on the total invested capital rose to a peak of 38.3 per cent in 1950 for Massey-Ferguson and 34.5 per cent in 1949 for Cockshutt Farm. The return on stockholders' investment in Massey-Ferguson Limited climbed in 1949 to a spectacular 56.9 per cent before taxes and 33.1 per cent after taxes. In the same year, the return on stockholders' investment in Cockshutt Farm reached a peak of 43.8 per cent before taxes and 19.4 per cent after taxes. Although 1953 marked the beginning of a period of declining profits the average return on total invested capital before taxes for the period 1947-1953 was 26.9 per cent for Massey-Ferguson and 21.9 per cent for Cockshutt Farm while for the same period the average return on stockholders' investment was 38.1 per cent before taxes and 20.5 per cent after taxes in the case of Massey-Ferguson and 26.7 per cent before taxes and 12.8 per cent after taxes in the case of Cockshutt Farm Equipment.

However immediately following this period Cockshutt suffered two years of losses and a total of five years in which the return on invested capital before taxes remained below 5 per cent. The greater strength of Massey-Ferguson because of its more widely dispersed operations is indicated by the fact that although this company's profits dropped sharply they did not fall below the level of 5 per cent before taxes on invested capital and in all but two years since 1953 have been well above that level. Massey-Ferguson achieved an average rate of return of 9.4 per cent before taxes on invested capital and a return on stockholders' investment of 11.7 per cent before taxes and a quite creditable rate of 7.2 per cent after taxes. Cockshutt Farm Equipment showed a much smaller rate of return, for the period 1954-60, an average of 1.9 per cent on total invested capital before taxation and as far as stockholders' investment was concerned a rate of 1.0 per cent before taxes and 0.8 per cent after taxes.

Nevertheless for the whole of the period 1947-60 Cockshutt Farm Equipment earned a return of 10.2 per cent on total invested capital before taxation and on stockholders' investment 12.3 per cent before taxes and 6.1 per cent after taxes. Massey-Ferguson showed a return of 14.7 per cent on total invested capital before taxation and on stockholders' investment a return of 19.6 per cent before taxation and 11.1 per cent after taxation.

It would appear that these two farm machinery companies have not made exorbitant profits since 1954, but there is very strong evidence that considering the whole of the post-war period these companies have realized a rate of return that has been more than adequate. There is no doubt that the prices of farm implements could well have been reduced in the early half of the post-war period. At the same time, we believe that the lower profit levels of the companies in more recent years reflect the agricultural recession and do not confirm the appropriateness of the present price levels of farm

machinery. Evidence obtained during past investigations has indicated that the lower profit levels or losses of farm machinery companies during agricultural recessions reflect the higher costs of producing at less than capacity levels of an industry with relatively high fixed overhead costs. Had the prosperity of agriculture been maintained it seems reasonable to assume that the resulting higher sales would have enabled price reductions of farm implements to take place while still assuring the farm machinery industry of adequate returns.

The importance of this factor in the farm implement industry has been noted by W. F. Phillips in his book *The Agricultural Implement Industry in Canada*. As he puts it:

Because of high income elasticity, the fluctuations in Canada's farm income have been projected onto the operations of the implement industry in magnified form, resulting in alternating periods of very high and very low output. The substantial profits which have been made by the industry in high output years have resulted primarily from decreased unit overhead costs in those years rather than from increased prices. Likewise, losses have resulted during years of low output, not because of falling prices but because of vastly increased overhead per unit.¹

A study done by the federal trade commission in the United States in 1948 came to a similar conclusion regarding the importance of steady, high-capacity production. As an example, the study points out² that the apparent unit cost of a 6-foot grain binder made by two manufacturers increased from comparable figures of \$172 and \$173 in 1929 to \$426.54 and \$430.83 in 1932, and then dropped back to equally comparable figures of \$151.77 and \$149.39 in 1936. This was in spite of the fact that direct material and labour costs fell between 1929 and 1932, and rose between 1932 and 1936. No doubt this is an extreme example, but it illustrates the drastic changes in cost due to the volume of sales. Many more examples of a similar kind are given in the study. It is in fact quite clear that stable farm income at a reasonable level is the real long-term answer for an efficient, low-cost implement industry.

Increase in Models of Farm Machinery

Another factor that, in our view, is contributing to higher production costs is the increase in the number of models of a particular machine manufactured by one farm machine company and also the trend towards more frequent model changes. This, as will be indicated later, also compounds the problems of distribution and maintaining adequate stocks of repair parts.

Figures 1 and 2 show the average number of years that tractors and combines manufactured by three of the major implement companies were continued in production over the period from 1948 to 1959. They indicate a substantial increase in the frequency of model change.

In the case of tractors, for example, it is apparent that a decade ago, models remained in production for about ten years; while today, the average production span of any one model is in the neighborhood of two or three years.

While no figures have been presented for the smaller machines, it is quite apparent that a similar trend is under way in their manufacture. For example, in the case of mowers, we have found many of the companies at

¹ W. G. Phillips—*The Agricultural Implement Industry in Canada*—University of Toronto Press, 1956, page 118.

² Report of the United States Federal Trade Commission on Manufacture and Distribution of Farm Implements, 1948, page 78.

the present time marketing mounted mowers, trailed behind mowers, semi-mounted mowers, with either pitman or balanced head drives. One may also obtain a variety of knife sections, guards and cutter bar lengths. Hay rakes are produced on much the same basis. With regard to cultivators we have both mounted cultivators and pull-behind types in a variety of models such as spring tooth, stiff tooth and heavy duty.

On the basis of these observations, it is fair to conclude that the trend to increasing frequency of model changes and increased models is industry wide, and covers the whole gamut of farm machines.

We recognize that some model changes represent technological advances, but a great deal of it is motivated by desire to place "sales appeal" in machine design. There is an increasing tendency, particularly in the manufacture of tractors and combines, towards annual changes in design merely to emphasize outward appearances. In our view, curvatures in sheet metal, flaring designs of radiator cowlings, etc. have all been the result of an attempt to enhance the "sales appeal" of a farm machine. Design features of this kind add nothing to the productive capacity of the machine, but do add, in many cases significantly, to the cost of production. Moreover, this represents part of the campaign by industry to subject farm machinery to the same features of "planned obsolescence" so familiar in automobiles and other consumer products.

This is part of what seems to us an unfortunate tendency in the industry to place an increasing emphasis on merchandising techniques. Indeed, the latest annual report of one of the farm machinery companies explicitly confirms this view indicating that:

The Company is continuing to observe and base its long-term planning on the increasing relative importance of effective marketing procedures in the sale of farm machinery. While no thought is given to any curtailment of effort in the introduction of new products and the improvement of existing ones, it is being recognized that customer acceptance of real advances in product design are each year more dependent on the skill with which these are merchandised.

Thus greater emphasis is being given to ways and means of improving Company performance in marketing, and it is expected that this will be a key-note for possible changes in the future organizational structure.¹

Standardization of Farm Machines and Parts

In Saskatchewan today there are nine major manufacturers of farm machinery offering complete lines of equipment although three companies make up by far the largest sales. We believe that the cost of maintaining nine headquarters staff, nine research organizations, nine assembly lines turning out nine sets of machines designed to do the same thing, nine advertising and promotional campaigns and nine systems of dealerships, is too much for an agriculture caught in the vise of a cost-price squeeze. This, in our view, is a problem that pervades the industry with perhaps exceptions in some lines of specialized equipment with limited sales.

As we have indicated, some measure of amalgamation of farm machinery production facilities and thus standardization has been accomplished by the industry itself although this concentration of private ownership has carried with it all the dangers of uncontrolled private monopoly power. Obviously any further steps require a wide measure of public ownership and direction in

¹ 1960 Annual Report of Cockshutt Farm Equipment Limited, Director's Report to Shareholders.

Figure 1
FREQUENCY OF MODEL CHANGE OF TRACTORS

Figure 2
FREQUENCY OF MODEL CHANGE OF COMBINES

order to achieve both lower costs of production and adequate safeguards for the farmer purchasers.

The special House of Commons committee on farm machinery prices recommended in 1937 that:

...the companies should encourage the further standardization of replacement parts in the same implements manufactured by different companies and in addition standardization of the implements themselves.

Evidence is at hand to indicate that at least some manufacturers have over the years incorporated some standardization of parts within their line of equipment, but much of the value of this has been lost by the lack of cross-reference data in parts books and manuals. In any event, the surface has hardly been scratched.

There is little doubt that the manufacturers are not likely of their own free will to attempt any extensive planned degree of standardization among themselves particularly since the manufacturers have instituted intentional design differences to allow for the most effective use of sales features in advertising and sales campaigns.

However, even within any one manufacturer's line of equipment there is much room for standardization of the design of machine component parts. It is possible, and indeed quite practical, for design engineers to standardize the use of a much lower number of different bearings for their lines of equipment, than has heretofore been the case. In some machine applications, this would result in increasing the cost since certain bearings might be over-designed for the particular application. However, offsetting this would be the substantially reduced repair inventory requirements, right through the company from the manufacturer to the dealer's stock, to say nothing of the possibility of economics accruing from larger bulk buying.

Standardization of component parts for tractor motors has been undertaken to a very limited extent by at least one of the manufacturers of farm machinery to date. It is not only economical from a parts supply point of view but also in terms of production to have all pistons identical regardless of the number of pistons or the size of the power plant. The same reasoning applies to connecting rods, connecting rod bearings, rings, valves, valve springs, main bearings, etc. In this regard, a leaf could be taken from the book of General Motors Company who have for many years now, manufactured their diesel power plant in a horsepower range from small units up to quadrupled 500 horsepower units, on a standardized design basis. The pistons used in the small units are identical to those used in the large, as are almost all other component parts.

Standardization can be carried further within a line of machines. Standardization of such items as ledger plates, knife sections, guards, etc. between swathers and combines could be established without any real problems. The design of reels, including bats, arms and spiders, could also be standardized between swathers and combines.

Standardization in this sense could be exploited to a much greater degree by farm machinery manufacturers than is the case to date, and should result in significant savings in many areas of the manufacturing and distributing of farm machinery.

Rationalization of the Farm Machinery Industry

In our view, rationalization of farm machinery production and distribution constitutes one of the most important areas for reduction in farm machinery costs. Rationalization of the industry would result in savings through the standardization of farm machinery and parts, the reduction in the total number

of farm machinery models and the elimination of unnecessary model changes and savings in distribution.

It is obvious that these savings, which should be reflected in lower prices, cannot be realized without thorough reorganization of the industry. In the light of the inability or unwillingness of the industry itself to accomplish this, public intervention and regulation is essential.

Therefore, we would urge the committee to consider a three-fold program under which public, private and co-operative ownership of farm machinery production could be used to serve Canadian agriculture. This could involve the nationalization of the Canadian privately-owned farm machinery industry. An alternative would be federal loans to enable an enlarged co-operative farm machinery industry to be established.

Any national agency set up to manufacture and distribute farm machinery in Canada would of necessity have to be the sole importing agency of farm machinery also. Such an agency could either establish its own system of distribution or provide for the development and expansion of farmer-owned co-operatives for that purpose and perhaps also employ in some instances the distribution agencies.

These recommendations may appear to be drastic but it is sadly evident that the present system of farm machinery manufacture and distribution has failed to provide Canadian farmers with machinery at reasonable prices. Therefore it is clear that only such action has any chance of solving the problem.

Other Recommendations

If this program of public or co-operative ownership of the Canadian farm machinery industry is not proceeded with, it will be necessary to consider what alternative proposals can be made regarding the private manufacturing sector of the industry.

We would make at least two recommendations in this connection. First, we recommend the establishment of a federal farm machinery prices tribunal with authority, either on its own initiative or at the request of any farm organization or other group, to investigate the price of any farm implement, to determine whether this price is justified by cost of manufacture and if necessary, to rule that the price must be reduced.

Second, we would recommend the establishment of an advisory technical body possibly attached to the proposed federal farm machinery prices tribunal to maintain a continuous review of the effect of model changes and multiplicity of models on manufacturing costs and also to recommend specific measures of standardization of farm machinery and parts. We believe that no farm machinery price increases should be approved unless the companies have indicated that appropriate measures to standardize production have been taken.

SECTION III

TRANSPORT COSTS OF FARM MACHINERY

The principal sources of supply of farm machinery for western Canada are points such as Brantford and Hamilton in Ontario, and various points in Iowa, Illinois, Michigan and Wisconsin. Therefore generally speaking farm machines must be transported considerable distances from their factory sources to their western Canadian destinations.

The impact of freight rates on farm machinery prices has always been a matter of concern. In 1937, for instance, the House of Commons special committee on farm implement prices found that:

In western Canada, taking Regina as a base, this freight cost (on Canadian-made implements) constitutes roughly 9 per cent of the farmer's dollar expended in the purchase of farm implements.¹

This is spelled out in detail in a table entitled "Comparison of Typical Implement Costs and Sales Realization Data" which indicates that for 35 typical implements manufactured in Canada by four companies weighted in terms of sales volume for the 10 years, 1926 to 1935 inclusive, 9.2 per cent of the cash price to the farm (Regina basis) covered freight costs from the factory.²

Another table entitled "Statement of Tractor Costs and Sales Realizations" indicates that for the period 1926 to 1935, 5.58 per cent of the price to the farmer in Regina of three tractors (weighted average) from International Harvester Company went to freight costs from factory.³

In the post-war period, the Canadian railway freight rates on farm machinery in common with those imposed on other goods shipped to western Canada have climbed very steeply. Since there has been no effective truck competition on farm machinery shipments from eastern Canada, the percentage increase of freight rates on farm implements has been one of the highest of any commodity. While a complete analysis of the freight rates borne by the thousands of commodities that move to western Canada would be too time-consuming, we have compared the percentage freight rate increase on farm implements with those applicable to various random commodities (see table 12). Of the commodities tested, the percentage freight rate increase on farm implements is the highest by a considerable margin indicating the heavy impact of freight rate increases on this commodity.

¹ Rates to Moose Jaw.

The rail freight rate on farm machinery shipped from Brantford, Ontario to Regina, Saskatchewan has increased from \$1.28 per hundred pounds prior to April, 1948 to \$2.83 since May 6, 1960 (basis flat car, 24,000 pound carload

³ Ibid, page 1236.

minimum) and except for the \$20 million subsidy instituted on normal rated traffic would stand at about \$3.11 per hundred pounds (see table A-11 of appendix A).

As a result of this rapid increase, the freight burden as a proportion of the price of farm implements would appear to have risen since 1947. This at least, may be stated on the basis of a comparison of the freight rates on two Canadian produced implements (see Table 13). It should be noted too that the railway freight rates on farm machinery to western Canada have increased more since 1947 than the index of farm machinery prices in western Canada. However, a study of the freight costs on farm implements shipped from the United States suggests that freight costs are now a smaller proportion of the final cost of a farm implement (see table 14) than was indicated by the 1937 House of Commons farm implement prices committee.

¹ Retail price in Regina has been estimated basis list price f.o.b. factory plus freight charges from factory to Regina.

It would appear that the present relatively lower burden of railway freight rates as compared with the twenties and thirties is at least partly explained by the reduction in the ratio of weight to power or capacity of some of the significant machines as their power or capacity has increased. Since the thirties the trend toward higher power tractors coupled with certain reductions in the weight-power ratio even in machines of the same horsepower rating has served to produce this relative reduction in the freight cost burden. It might be noted that the International Harvester W6 tractor widely used in the thirties and early forties weighed 15.8 pounds per drawbar horsepower (basis 5,037 pounds and 32 h.p. maximum) as compared with the International 660 tractor of today weighing 11.8 pounds per drawbar horsepower (basis 8,473 pounds and 71.8 h.p. maximum).

It appears, too, from table 14 that freight costs constitute a considerably higher proportion of the cost of the less expensive machines such as diskers and cultivators than is true of tractors and combines. This is as one would expect since such machines have a high weight in relation to price.

Also freight costs on Canadian-produced farm implements are almost without exception higher in absolute amount and as a proportion of the final

cost of farm implements than they are for comparable implements from the United States. Thus freight rate increases tend to place the Canadian farm implement industry at a competitive disadvantage.

In conclusion, we would recommend that the board of transport commissioners make a special investigation of railway freight rates on farm machinery with a view particularly to determining the relative impact of freight rate increases on farm implements as compared to other commodities. Such evidence as we have submitted would indicate that not only have horizontal freight rate increases imposed an unfair burden on regions like western Canada but even within the region has imposed an unfair burden on farm implements. While we are not suggesting that a major reduction in farm machinery costs could be made by reducing freight rates it is still very important that freight rates be kept to the lowest possible level. If the board of transport commissioners confirms our view that there is an element of freight rate discrimination against farm implements, the board should issue an order to roll-back such rates to a more appropriate level. The absence of truck competition except in the case of tractors from the United States sources makes such special action imperative. It must also be borne in mind that the Crowsnest Pass agreement originally applied to shipments to western Canada of farm machinery so that every increase in freight rates on farm implements represents another breach in an agreement that was entered into originally in good faith.

SECTION IV

DISTRIBUTION COSTS OF FARM MACHINERY

One of the conclusions of the 1937 House of Commons committee on farm machinery prices was that "the cost of distribution of farm implements is unnecessarily high and constitutes an important factor in the prices to the consumers." We believe that the farm machinery distributing system still constitutes an important area for possible cost reductions and we particularly urge the committee to closely investigate this field. It is apparent that such a study would require the closest co-operation of the farm machinery companies since they alone possess the definitive information from which costs might be determined. We suggest that only a federal committee or other agency acting at the federal level can conduct the kind of national study of distribution costs that is required.

Nevertheless, information obtained some years ago by a special committee of the Saskatchewan legislature indicates the general magnitude of the costs prevailing at that time and we believe we can indicate some of the factors operating to increase distribution costs.

The special committee of the Saskatchewan legislature on farm implements reported in 1952 that "accounting analysis revealed that distribution costs (not including freight) appeared to absorb at least \$25 for every \$100 spent by the farmer. This estimate does not include C.C.I.L. whose distribution costs were significantly lower".¹ It was indicated by a study of the tabulation of branch expenses that such expenses "are at present averaging some 5 per cent of retail sales of the major companies in Saskatchewan, which is considerably less than the percentage experienced in 1938 of some 17 per cent to 20 per cent and as observed in the Ottawa inquiry of 1937".²

The same report² added that commissions to dealers (for the period 1946 to 1951) ranged from 20 to 23 per cent of the retail sales price in the case of

¹ Report of the Special Committee of the Saskatchewan Legislature on Farm Implements, page 14.

² Interim Report on Distribution Costs prepared by Millar, MacDonald & Company of Winnipeg, Manitoba—Exhibit No. C-15 submitted to the Special Select Committee on Farm Implements—Legislature of the Province of Saskatchewan, page 2.

Massey-Harris Company Limited, 15 per cent to 20 per cent in the case of John Deere Plow Company Limited, 15 per cent to 21 per cent with average approximately 20 per cent for Cockshutt Farm Equipment, 18 per cent to 23 per cent for International Harvester Company of Canada Limited.

It would seem obvious that the lower level of branch expenditures for the period 1946 to 1951 was partly a result of high sales. We would suggest that with the lower sales of the past few years that branch expenditures as a proportion of the value of total retail sales have probably increased but this is one of the matters we believe the committee can most appropriately investigate.

It was found in 1952 that:

The outstanding factor which accounts for a considerable part of this discrepancy (between 1946-51 branch expenses and those in 1938) is the virtual absence of bad debt losses and collection expenses in recent years. However as a percentage of sales, distribution expenses otherwise have declined substantially since 1939. It must be remembered that whereas branch expenses have declined since 1939, dealers' commissions have increased, although not proportionately.¹

It may very well be that dealers' commissions as a proportion of the value of retail sales are higher today than in 1952. But any efforts to determine actual commissions is complicated by the wide-spread practice today of dealers taking losses on trade-ins which naturally serves to reduce the commissions realized. This again is a matter we trust the committee will consider in its study.

Machinery Distribution in Saskatchewan

At the present time nine major full-line farm machinery manufacturers maintain a province-wide system of dealerships while in addition numerous independent companies offer partial lines of farm implements both large and small. A total of about 1900 dealers were spread throughout Saskatchewan in 1960 serving an average of 52 farms apiece. Although we have not obtained the precise figures for the other prairie provinces, there is little doubt that this distribution pattern is repeated in Alberta and Manitoba.

We believe that this involves a considerable element of duplication of facilities. One effect of this is the increased cost arising from company servicing of parallel facilities selling in the same market. In some cases too the company pressure for an extensive system of dealerships has led them to accept unsuitable applications. Company field representatives have indicated that a great deal of a territory supervisor's time is then taken servicing such dealers who also sell the lowest percentage of farm machinery.

In addition, the close proximity of dealers has contributed greatly to their declining financial position. Most companies have been thereby forced into the position of providing costly credit facilities to uneconomic dealer operations.

The next section indicates the unsatisfactory operation of this dealer structure in maintaining adequate supply parts.

We believe that the most effective reorganization of the farm implement dealer structure to combat these problems is contingent upon two changes in farm machinery company policies. Firstly, the rationalization of farm machinery manufacture along lines we have already suggested would tremendously facilitate the establishment of more economic machinery distribution.

¹ Ibid, page 2.

On the other hand, if the program we have set out in section II is not adopted, it would be necessary at the very least for the farm machinery companies to change their general policy of exclusive dealerships which is now only rarely breached under special circumstances. By this means, the number of dealers might well be reduced while maintaining more effective service. It should be recognized that the system of exclusive dealers is a comparatively recent development representing in part an effort of the large farm implement companies to squeeze out the smaller ones as indicated by the 1948 report of the United States federal trade commission. Although there are some signs in Saskatchewan of an increasing number of "multiple" dealers handling two or three or more lines of farm machinery, these are almost without exception for the smaller full-line companies.

We see very little possibility of the companies being persuaded to change their basic policies in this regard on anything less than a regional basis. Therefore the government of Saskatchewan would welcome a regional conference representing the federal government, the governments of the four western provinces, representatives of the farm machinery industry, the farm implement dealers association and of the farm unions to consider the suggestions made here as well as other means by which the system of distribution might be more effectively organized. Such a regional conference might also be appropriate for the eastern Canadian provinces.

Repairs Parts Supply

One of the primary functions of the farm implement dealer as far as agriculture is concerned must be to maintain an adequate stock of repair parts and to properly service the machines he sells. In many important respects, the very extensive system of dealerships has failed to do this. In fact, in our view the very extensiveness and the duplication of facilities offered has contributed to these failures as has the rapid change-over of farm machinery models and the increasing number of models. In addition, the increasing complexity of today's farm machinery has added to the number of parts required. All of these factors have combined to produce the present unsatisfactory situation. It has been financially difficult for the local dealer with a limited sales area to maintain an adequate stock of repair parts for the very wide line of farm implements he sells and more particularly has sold in the past. Thus, again and again local dealers have been found to be without needed parts. Moreover, on many of these occasions supplies of the required part have not been available even at company depots anywhere in the province. All of this adds considerably to the cost of farm operations in terms of time lost and long trips to locate the required parts.

Approximately half of the estimated value of repair parts available in Saskatchewan in 1960 was at the dealer stocking level, and the other half at the company depot level for an estimated total of approximately seventeen and a half million dollars available in Saskatchewan at any one time during 1960 (see Table 15). Keeping in mind that Saskatchewan's 1960 repair parts sales were in the order of \$10,700,000 (wholesale value), the figures indicate that repair part sales were about 60 per cent of farm machinery repair parts inventories during the summer season.

TABLE 15

ESTIMATED VALUE OF REPAIR PARTS FOR FARM MACHINERY
ON HAND IN SASKATCHEWAN, 1960

Repair Stocks in Dealers Hands	Average Inventory of Parts Carried by Branch	Total Value of Parts in Saskatchewan
\$9,189,000	\$8,488,000	\$17,677,000

Source: Agricultural Machinery Administration, Department of Agriculture, Province of Saskatchewan.

Thus, the problem of maintaining adequate stocks of parts is two-fold. The first lies, as has been indicated, at the dealer level. It is clear that before it would be economical for many dealers to carry adequate repair stocks it would be necessary for the sales area available to them to be increased. At the present time many dealers merely duplicate the small fast-moving stock that their competitive dealer carries a few miles away (often selling the same line of goods). The improvement in the financial strength of farm implement dealers that would result from a more rational distribution system should enable them to provide better repair part stocks and services to farm users.

The second problem arises at the depot level partly as a consequence of the first. At peak periods multitudes of non-stocking dealers overwhelm the manufacturer's branch depots with orders. When the manufacturer is also following a policy of maintaining depot stocks at an absolute minimum, the whole system of distribution, in effect, breaks down for a period and farmers in need of repairs may be left stranded at crucial periods in their farming operations.

We have attempted to deal with this problem through legislation such as the Farm Implement Act but our experience indicates that action on the provincial level alone is insufficient. For instance, we have found that the problem of maintaining adequate stocks is as complicated at the depot level as at the dealer level by the variety of models and the frequency of model change. The rapid change of models has brought with it a very high degree of obsolescence as far as repair parts are concerned (suggested in some quarters to be planned obsolescence). Supply problems are apparent at the depot level particularly in relation to machine model that were only on the market for short periods of time. Repair depots appear to be very reluctant to maintain adequate stocks of repair parts for new model machines because of lack of experience with the machine and consequent lack of any repair requirement record.

A reduction in the number of models, and less frequent model changes would greatly facilitate the maintenance of adequate stocks of repair parts. In addition, the problem of repair parts supply would be greatly eased if a thorough-going program of standardization of farm machines and parts were adopted.

We have already set forth in Section II a program of rationalization of farm machinery manufacturing and distribution. We believe this would provide substantial savings to agriculture. Not the least of the advantages of such a program would be the lower cost of maintaining an adequate stock of repair parts and the elimination of much of the present problem the farmer now faces of being unable at critical periods to secure needed parts.

Co-operative Distribution

We should like particularly to stress the economies that could be realized from a system of distribution such as that envisaged by Canadian Co-operative Implements Limited. In our view, the establishment of C.C.I.L. and the later

formation of Co-operative Fédérée of Quebec represent one of the new hopeful recent development in the distribution of farm machinery. We believe that the system of area parts and machinery depots, being established by the Canadian Co-operative Implements Limited is a rational one which avoids the unnecessary expense of costly overlap facilities of most of the other farm machinery companies and might well be accepted as a model.

Annual reports of C.C.I.L. have set this out in some detail. For instance, the 1961 annual report stated:

It is hoped that within the next few years the depot building program will be completed. It is planned to establish a total of some 60 depots, and, in so doing, to put a C.C.I.L. place of business within reasonable driving distance of almost every prairie farmer.

The essence of the C.C.I.L. distribution plan is, in the interests of economy and efficiency, to limit the number of depots to no more than 60. We believe that in the purchase of a machine, or even of a repair part, it makes little difference to any member if he has to go to a town that he is not normally in the habit of visiting. We believe that what he really wants is to be sure that the repair and any other service that he needs is available when he gets there. The other thing the farmer should want is to keep the cost of handling machines and repairs at the lowest practicable level so that he gets the greatest possible saving.¹

Again, another C.C.I.L. Annual Report stated:

Perhaps not too many people realize that C.C.I.L. has also blazed a new trail in the physical distribution of machines. Nor do they perhaps realize the significance of what is involved in this new way of distribution. But it is, we believe, of very great importance and it is our opinion that it provides a pattern which will be followed by others and eventually become the standard instead of the exception. This for the simple reason that it is more efficient and economical.

This distribution system is still in an early stage of development. The original plan approved by your Directors thirteen to fourteen years ago envisioned five branches and between fifty and sixty depots strategically located all the way from the Red to the Peace and providing a C.C.I.L. place of business within a travelling distance of less than 25 miles for the average farmer. This setup is believed to provide all that was essential for the most economical and satisfactory sales, repair and machine reconditioning service. The objective was, and is, to provide first-class repair and machine shop service at all those points.²

The operation of C.C.I.L. has already, in our view, brought substantial economies to western Canadian agriculture as indicated by the fact that farmers who have patronized the C.C.I.L. made very real savings. We believe that co-operative systems of distribution such as C.C.I.L. should be given encouragement and assistance. However, we shall not go into this question in detail since we understand that C.C.I.L. is submitting its own brief to the committee.

SECTION V

PUBLIC TESTING SERVICES FOR FARM MACHINERY

The prudent selection of farm machinery can yield as significant financial benefits as might result from a reduction in the initial price. Yet although some points on the performance of a machine are obvious to the purchaser,

¹ 1961 Annual Report, Canadian Co-operative Implements Limited.

² 1959 Annual Report, Canadian Co-operative Implements Limited.

many are not. To make an intelligent choice the user must have available unbiased information on the performance of the machines on the market. Moreover, this information must be based on general conditions under which the machine will be used. Thus, some form of farm machinery testing program is essential.

Since even the most thorough tests by the farm machinery companies themselves lack the necessary objectivity and are in any event, rarely found to be adequate, government testing programs have been established. Today such tests are a service available to farm people and manufacturers in 21 countries outside the Soviet bloc. The National Institute of Agricultural Engineering has provided a public testing service on farm machinery in the United Kingdom for almost 18 years, while the Swedish government Agricultural Machinery Testing Institute was first established in 1897 and has grown progressively since that date. In the latter case, almost every farm machine sold on a large scale in Sweden is submitted voluntarily by the manufacturer to the Swedish government Testing Agency for field testing and the publishing of the test report.

For the convenience of the committee, a list of these countries and the testing organization in each is given in appendix G.

Although the United States and Canada have shown the greatest degree of farm mechanization, public testing programs have not been established here to the same extent. In fact, the farm machinery testing program begun in 1958 in Saskatchewan is the first comprehensive testing program on the North American continent although the Nebraska tests which are confined to tractors have been conducted for many years.

Because of the interest expressed in the Saskatchewan program by members of the House of Commons agriculture committee at one of the first sessions concerned with the study of farm machinery prices, we are reporting at some length on the background and experience of the agricultural machinery administration in the province.

The desirability of a testing program was recognized by the selection special committee on farm implement prices and distribution of the Saskatchewan legislature which studied the matter in 1939. Among other recommendations, this inquiry pointed out that federal and provincial government organizations should "be encouraged to test the utility of new implements to suggest improvements and where possible, to encourage standardization of implements and repair parts."¹

Again, in 1952, the special select committee of the Saskatchewan legislature on farm machinery recommended "that the provincial government consider the creation of a farm implement board to test, inspect and certify under actual working conditions, farm implements and machines sold in Saskatchewan."² As a result of these inquiries and continued requests from farm people the province of Saskatchewan in 1958 set up the agricultural machinery administration to perform the following duties in the machinery testing field:

- (a) test and appraise under actual working conditions implements sold or offered for sale in Saskatchewan.
- (b) undertake development work to improve and develop implements for use in Saskatchewan.
- (c) publish such reports, pamphlets and bulletins as are consistent with the intent of this Act.³

¹ Report of the Select Special Committee on Farm Implement Prices and Distribution, 1939, Legislature of the Province of Saskatchewan, p. 48.

² Report of the Select Special Committee on Farm Implements, 1952, Legislature of the Province of Saskatchewan, p. 36.

³ Agricultural Machinery Act, c. 91, Statutes of Saskatchewan, 1958, s. 5 (2).

Since that time, the agricultural machinery administration has designed and constructed the instrumentation that is required to precisely measure the performance characteristics of machinery under various conditions throughout the province, tested and evaluated some 40 individual farm machines and published public test reports on them. The favourable response to the farm machinery testing program of farm people in Saskatchewan, as well as in Alberta and Manitoba, is indicated by the large number of requests for test reports received from farm people during the first 21 months of the operation of the program. Over 8,000 farmers in Saskatchewan have made written requests for the test reports. Farmers in the province of Alberta have also indicated their desire to receive them, and as a result the Alberta department of agriculture has completed arrangements with the government of Saskatchewan to acquire the A.M.A. test reports on farm machinery for distribution in the province of Alberta beginning in 1961-62. In addition, the government of Alberta is contributing an operating grant to the A.M.A. to assist in machinery testing.

We believe that the concrete results of the tests have fully justified the establishment of the program. In almost every instance the field testing of the units has led to changes by the manufacturer that have improved the functional and structural performance of the machines.

As an example, field test number 859 carried out on the "Du-Al" windrower manufactured in the United States and sold in Saskatchewan, points up the importance of field evaluation of farm machines by an independent organization. The test on this machine revealed its inability to perform in an acceptable manner in Saskatchewan grain fields and the public report which was released in June, 1960, stated, "the swather is not capable of satisfactory operation in cereal crops as bunching of the swath and driving on the swaths at the corners is not acceptable."¹ As a result of the field testing of this machine, the manufacturer stated as follows in the published report:

We have evaluated the tests conducted and are in complete accord with all the modifications recommended by the agricultural machinery administration. This machine is not presently for sale in the province of Saskatchewan and is now undergoing modifications. It will not be released for sale until the necessary modifications have been made and tests have proven that this unit is satisfactory for use in Saskatchewan.¹

The machines that had been sold in Saskatchewan by the manufacturer of this machine, were accepted in return by the manufacturer and the farmers involved were refunded their purchase price.

Further evidence of the usefulness of a public testing program on farm machinery is revealed by field test number 459 carried out on a heavy duty cultivator in 1959. This machine was placed on the market for the first time that year and following a test, the agricultural machinery administration made a number of recommendations to the manufacturer for improvement in the basic design of the unit to make it more useful in Saskatchewan conditions. One of the significant recommendations was as follows: "Modifications of the spring clamp release assembly to reduce wear and failure of the component parts."² In the public report, the manufacturer stated as follows with regard to this recommendation.

The original springs and pivot pins in the spring clamp release assemblies were not made to engineering specifications and as soon as

¹ Test Report No. 859, Agricultural Machinery Administration, Province of Saskatchewan, p. 18.

² Test Report No. 459, Agricultural Machinery Administration, Province of Saskatchewan, p. 15.

discovered, a dealer's service bulletin was issued authorizing replacement of all defective pins and springs on a no-cost basis to the customer. The design of the spring retainer plate assemblies has been improved and a dealer's service bulletin has authorized the exchange of the original plate assemblies on a no-cost basis to the customer. These changes on the spring release clamps as authorized by the dealer service bulletins for machines in the field, and also provided on future production machines, will now provide satisfactory performance and wear life.¹

In the same report it was recommended to the manufacturer that: "Modifications be made on the mounting of the lower pivot pin of the rear hydraulic cylinder (to prevent undue wear)."² The manufacturer in this regard stated in the report that: "Additional bearing area is being provided in future production."³

Test number 359 carried out in 1959 was a test on a machine just introduced to the western Canadian market for the first time. A number of recommendations were made to the manufacturer by the agricultural machinery administration following the test to this unit and effective correction programs in the design of the machine were undertaken by the manufacturer. By way of example, three of these recommended that the manufacturer consider:

- (1) Modifying the gang and bale assembly to prevent tilting of the gangs.
- (2) Modifying the front furrow wheel vertical post assembly.
- (3) Modifying the seeder drive and gauging cam.⁴

In the same report, the manufacturer stated, relative to these recommendations as follows:

- (1) Adjustments have been provided in current production to position disk gangs relative to the bales to prevent tilting. These modified parts have been supplied on a no-charge basis to all customers.
- (2) Construction has been changed to strengthen this assembly on current production.
- (3) The material and design of the cam throw out arm has been changed in current production and has been supplied on a no-charge basis to all owners.⁵

This experience with a farm machinery testing program has led us to certain conclusions. We have concluded, for instance, that very few new models of farm machines come on the market free from mechanical and functional defects. Some of these defects are taken care of by the manufacturer upon receipt of experience data from farm users; but others remain to mar the performance of the machine or to be corrected by mechanical changes at the user's expense. In many cases, the changes dictated by field experience are made available to the user only at an additional cost. In other words, it may seem fair to state that farm machinery manufacturers use farmers to work out the "bugs" on new machine design.

In addition, one of the basic problems is that manufacturers design machines primarily for their biggest market areas, and it is a recognized sales fact that the Canadian market is only about one-seventh of the U.S. market. For this reason, farm people in Saskatchewan are often faced with the necessity of using a machine designed primarily for other areas entirely, and because of this, find them quite unsuitable for Saskatchewan and western Canadian conditions. A prime example of this problem occurred in the fall of 1959 when many farm grain driers were brought into the province. For the most part, these

⁴ Test Report No. 359, Agricultural Machinery Administration, Province of Saskatchewan, p. 14.

⁵ Ibid p. 14.

driers were designed to dry shelled corn, and certainly in no case had the design been modified to avoid damage to the milling and baking qualities of hard red spring wheat.

Related to this is the fact that the performance of such machines in specialized conditions of Saskatchewan and western Canada as a whole, may not be indicated by the advertising literature of the company and the performance information that the company might have available. Actual performance studies right in various western Canadian farm conditions is the only real method of evaluating the functional and structural performance of a farm machine for use in western Canada. With the significantly high portion of farm income being poured back into farm machinery, operators can ill afford to purchase high priced machines that will not perform in the manner anticipated.

We would also suggest that although farm machinery manufacturers do provide a good deal of field trial data as far as tractor design is concerned, there appears to be a significant lack of field data used in the design of farm implements. As a result, functional performance as well as some aspects of structural performance leave a good deal to be desired. It is suggested that perhaps some of the time and effort presently being employed to improve "sales appeal" could probably be diverted both from the users point of view and the manufacturers point of view, to improve functional design, based on field trial data.

It is recognized, however, that there is a point of diminishing returns in relation to adequate machine design as a tool of production. It is conceivable that so much effort could go into the designing of a machine that the selling price would be uneconomic to the farm user. On the other hand, the use of such things as sealed bearings, more belts and less chains, more intelligent machine designs eliminating moving parts, has added comparatively small increments of cost, while increasing productive capacity. It is in this area of machine design that manufacturers could improve profitably the quality of their product without materially increasing the selling price.

Saskatchewan's machine evaluation program has been able to provide for farm people detailed functional and structural performance information on farm machinery in advance of machine purchasing. With this type of information available, they are then able to interpret the functional (capacity, etc.) performance of the machine in relation to their own farm conditions and thus avoid the possibility of spending large sums of money on machines that are not suited to their particular application or buying a machine with much lower capacity than was anticipated.

As is indicated elsewhere in this brief, the number of model changes is rapidly increasing. Approximately 50 to 60 new units appear on the market each year, but in its three years of operation 40 machines have been tested by the Saskatchewan A.M.A. This indicates that it would be necessary to expand the testing program of the A.M.A. considerably to provide farm people with performance data on all of the new units being made available each year.

We believe this can be most economically done by the establishment of a federal-provincial regional public farm machinery testing agency in western Canada contributed to by the three prairie provinces and the federal government. Since Saskatchewan already has an effective farm machinery evaluation service in operation at the present time complete with equipment, facilities and trained staff it would seem unnecessary and indeed uneconomical for these facilities to be duplicated in other provinces in the west. Thus we would suggest that this existing agency could provide the basis for an expanded regional program with the extent of financial support and other matters of administration worked out by mutual agreement with all parties concerned. We would particularly emphasize the important responsibilities of the federal government in this field and would urge that substantial federal financial assistance be made available.

The annual costs in Saskatchewan at this point in the development of the testing services are less than one quarter of 1 per cent of the cost of farm machinery purchased annually by farmers in the province. We believe that although the amount of dollars involved is comparatively small in relation to the amount of machinery purchased, the savings made available to farm people through the public testing program has been many times greater than the expenditure.

A regional public farm machinery testing agency in western Canada could yield much greater results per dollar invested than even Saskatchewan's program since the cost of these tests the results of which are as useful to Alberta and Manitoba farmers as to Saskatchewan people would in that way be spread over a larger population. Approximately a three-fold increase in the testing program supported by public funds on the basis suggested could be a most fruitful avenue for assisting agriculture.

It is recognized that there are significant differences between the types of farm machinery used in western Canada and those used in eastern Canada. It would seem reasonable therefore to establish a similar regional farm machinery testing agency in eastern Canada, publicly supported in a similar manner to provide the same kind of service to farm people in the East.

In considering a farm machinery testing agency or evaluation service, it must be recognized that the proposed approach to performance evaluation is not research, and, therefore, is not a function that might usefully be undertaken by existing research organizations, such as universities, or experimental farms. The latter are and should be concerned with more fundamental research involving such basic relationships as disc designs, metallurgy as it relates to the wear characteristics of tillage tools, combine separation efficiency, and grain swath characteristics in relation to drying ability.

In conclusion, we should emphasize that the submission of new farm machines to A.M.A. for test is voluntary. We have almost without exception received the closest cooperation of the farm machinery companies. Indeed it would seem to be to their interest to do so since this unbiased field appraisal is undoubtedly of assistance to farm machinery manufacturers as well as to farm people. As a result of the controlled testing of farm machinery in Saskatchewan farm conditions, authentic performance information has been provided to farm machinery manufacturers and enabled them to design farm machinery that will perform more adequately in the specific field conditions of Saskatchewan and in other parts of western Canada as well.

SECTION VI

CREDIT FOR FARM MACHINERY PURCHASES

We believe that the provision of adequate credit at reasonable cost is an essential element of any program to provide agriculture with farm machinery at minimal prices. Fortunately the increased mechanization of the post-war period has been accompanied by the development of credit facilities that have been shown to be superior to those which existed earlier. The passage of the Farm Improvement Loans Act in 1944 providing for a federal government guarantee against losses of up to 10 per cent of the principal of farm improvement loans made by banks at a 5 per cent interest rate has relieved the farmer of a considerable portion of the onerous credit burden he was obliged to carry before the war. However, there are still farmers who have had to turn to other, and more expensive, sources of credit. Therefore we believe it is essential that the Farm Improvement Loans Act be retained as a permanent feature of Canadian farm credit policy and we shall make some suggestions which we believe will make it of still greater benefit.

The importance of the Farm Improvement Loans Act for farm machinery purchases is indicated by the fact that consistently about 45 per cent of the new tractors and about 55 per cent of the new combines sold in Canada were financed in part by farm improvement loans (see table 16 for the six-year period for which statistics were available).

TABLE 16

1955 and 1956—Number of tractors and combines financed from Annual Reports of Farm Improvement Loans Act; Percentages derived from a comparison with total sales figures as indicated by D.B.S., Farm Implement and Equipment Sales.

Indeed, generally well over 80 per cent of the amount of Farm Improvement loans was for the purchase of farm machinery with a consistently higher proportion in Saskatchewan (see Table 17).

Average 1945-59.....	—	86.3

SOURCE: Annual Reports of Farm Improvement Loans Act.

During the period 1948-1959, the average loan for tractors (new and used) was \$1,295 for Canada and \$1,373 for Saskatchewan. The average loan for combines (new and used) was \$1,727 for Canada and \$1,755 for Saskatchewan. It might be expected that the average loan for new machinery would be somewhat higher than this. (see appendix A, table A-12).

As we have indicated, we have a number of recommendations that we believe would extend and improve the Farm Improvement Loans Act. First of all, the act although originally passed in 1944 has been extended each time for a period of only three years. It is recognized that the passage of legislation to extend the operation of the act has become almost automatic but the time-limit does introduce some uncertainty on the part of both the banks and farmers into their long-range plans. Therefore we urge that the expiry date should be removed from the legislation.

Second, it appears that at the current rate of lending the present maximum of \$300 million that may be loaned under terms of the act will be exhausted before the latest time-period is up. In 1959 when the Minister of Finance introduced the latest in the series of bills extending the operations of the act, he retained the former maximum of \$300 million, but this was to cover not a period of three years as was previously the case, but one of three and one-quarter years (April 1, 1959 to June 30, 1962). However, loans have been running at the rate of \$100 million a year, actually \$98 million in 1959, \$102 million in 1960 (see appendix A, table A-13). It would therefore appear that if loans continue at this rate the funds available under the act will be exhausted sometime early in 1962. We are pleased therefore to note that the federal government has introduced legislation at the present session of parliament increasing the \$300 million limit.

A third proposal is that the maximum amount of a farm improvement loan should be increased from \$7,500 to \$10,000. We do not suggest that there is presently a very significant proportion of farm improvement loans that approach the maximum but we do feel that when otherwise justified the amount available to be lent under this program should not be too narrowly restricted.

In the fourth place, we believe that the period of repayment of farm machinery loans should be extended. At the present time farm machinery loans must be repaid within three years. Bearing in mind the fact that the average life of a tractor or combine exceeds this margin considerably, it seems reasonable to extend the repayment period to something like five or six years. This would seem to provide adequate security at the same time as it would ease the financial burden on the farmer for the absence of such a provision has the effect of driving the farmer to other and more expensive forms of credit.

Fifth, we believe that farm improvement loans should be made available to farmers in co-operative farms to the same extent as individual farmers. At the present time, the maximum farm improvement loan available to a co-operative farm is the same as that available to an individual farmer. Thus the average loan available to the farmer associated in a co-operative farm is very much lower than that available to the individual farmer. Thus would appear to be unjust discrimination.

As a further proposal, we would recommend that credit unions, central credit unions and co-operative credit societies should be included as agencies which may be authorized to make loans under the Farm Improvement Loans Act. We believe that the public interest requires the widest possible application of co-operative principles to credit needs. The growing strength of the credit union movement requires this form of recognition.

SECTION VII

SUMMARY OF CONCLUSIONS AND RECOMMENDATIONS

In our view, the question of farm machinery prices cannot be separated from the basic problem of the farm cost-price squeeze. The question of farm machinery prices is of urgent concern to Canadian farmers today because of the increasingly unfavourable ratio between the price of farm machinery and

the price of farm products. For instance, according to the D.B.S. index of farm machinery prices, a Saskatchewan farmer must today give almost three times as much wheat for a unit of farm machinery as was necessary in 1945. Had the prices of farm products advanced in common with other prices in the Canadian economy, increases in farm costs and more specifically in farm machinery, prices would not be such a heavy burden.

Despite the most rapid increase in productivity of any sector of the Canadian economy in the post-war period, income going to agriculture has lagged behind that of the rest of the nation. The reason for this is that farmers have very little control over the selling prices of their products in contrast to many other industries which are dominated by a few firms and able to maintain prices at a high level. Thus, although any reductions in farm machinery prices would have important benefits, the full benefits would not be realized unless fundamental changes in marketing and pricing policies are adopted by the federal government to enable agriculture to obtain a fair share of the national income.

We have noted the very considerable increase in the share of farm cash income required to meet the farm machinery bill (machinery operating costs and depreciation charges). In Saskatchewan this has climbed from under 20 per cent in the immediate post-war period to an average of 32 per cent in the period 1955-1959. We would also note that although in Saskatchewan in 1959, one-fifth of farm cash income available after the deduction of farm operating expenses went for farm machinery purchases (the second highest proportion of any year in the post-war period) this was not sufficient to maintain the stock of farm implements.

This effect of sharply reduced farm income and rising farm machinery prices is of special concern since no industry today can long continue to produce efficiently if its capital equipment is wearing out and is not being replaced at sufficient speed.

It is quite clear that since 1954 there has been a very marked deterioration in the condition of farm implements and equipment in western Canada. The estimated value of the stock of farm implements has fallen in just five years (1954-1959) by \$166 million for the prairie provinces and \$93 million for Saskatchewan alone. Also, the estimated age of tractors in Saskatchewan has risen alarmingly from 7.5 years in 1956 to 9.5 years in 1960. The estimated average age of combines in the province has increased from 7.9 years to 9.7 years in the same period. Obviously sales of farm machinery have been very much below replacement levels. This is also indicated by the fact that at the present average annual rate of sales since 1956 it would take 27 years to replace the present stock of tractors and 30 years to replace the combines.

Thus, the problem of farm machinery prices is particularly important at the present time since it is necessary not only to fill the ordinary annual requirements for machinery replacement but there is a heavy backlog of demand to catch up on.

We believe that federal measures to assure the maintenance of a stable and high level of farm income would contribute as much as any other factor to the most economic production of farm machinery. Farm machinery manufacturing and distribution facilities are set up to handle peak demand. When there is a sharp drop in sales, overhead costs continue at much the same level resulting in a considerable increase in the per unit manufacturing and distribution costs. In our opinion, it is essential that major fluctuations in farm income be eliminated as much as possible through establishment of an expanded program of orderly marketing, a pricing program for farm products relating prices to costs of production and assuring agriculture of a fair share of national income, an adequate federal crop insurance program to eliminate the effect of weather on farm income as much as possible, and other related measures.

Factory Prices of Farm Machinery

It is also imperative to determine the actual factory cost of farm implements in the post-war period. A special select committee of the Saskatchewan legislature was unable to do this in 1952 because of the refusal of the privately-owned farm machinery companies to supply necessary information. Therefore, we urge the House of Commons committee to conduct a thorough analysis of the accounts of the farm machinery companies to determine to what extent farm machinery prices have been justified by manufacturing costs and to determine the profit levels of the industry. We have submitted evidence concerning two of the farm machinery companies indicating that over the whole of the post-war period these companies have realized a rate of return that has been more than adequate.

In our view, a most important area for reduction in farm machinery costs lies in rationalization of farm machinery production and distribution. In Saskatchewan today there are nine major manufacturers of farm machinery offering complete lines of equipment. The cost of maintaining nine headquarters staff, nine research organizations, nine assembly lines turning out nine sets of machines designed to do the same thing, nine advertising and promotional campaigns and nine systems of dealerships, is surely too much for an agricultural economy caught in the vise of a cost-price squeeze to bear.

At the same time, even within individual firms the multiplicity of models and increased model changes would appear to have raised manufacturing as well as distribution costs. Industry policies of "planned obsolescence" are also raising costs.

Rationalization of the industry would result in savings through the standardization of farm machinery and parts, savings through the reduction in the total number of farm machinery models, savings through the elimination of unnecessary model changes and savings in distribution. The first of these was recommended by a House of Commons committee almost a quarter-century ago but we have seen only a few signs of this being achieved by the industry. Indeed we would suggest that the individual farm machinery companies have a vested interest in undermining such a program and therefore it seems unlikely that any very substantial standardization of farm machines and parts could be realized without direct government controls of some kind. We would also note that the problems of multiplicity of models and overly frequent model changes are a product of recent trends in company merchandising policy.

It is obvious that these savings, which should result in lower prices, cannot be realized without thorough reorganization of the industry. In the light of the inability or unwillingness of the industry itself to accomplish this, public intervention and regulation is essential.

Therefore, we would urge the committee to consider a three-fold program under which public, private and co-operative ownership of farm machinery production could be used to serve Canadian agriculture. This could involve the nationalization of the Canadian privately-owned farm machinery industry. An alternative would be federal loans to enable an enlarged co-operative farm machinery industry to be established.

Any national agency set up to manufacture and distribute farm machinery in Canada would of necessity have to be the sole importing agency of farm machinery also. Such an agency could either establish its own system of distribution or provide for the development and expansion of farmer-owned co-operatives and perhaps also employ in some instances the private distribution agencies.

These recommendations may appear to be drastic but it is sadly evident that the present system of farm machinery manufacture and distribution has

failed to provide Canadian farmers with machinery at reasonable prices. Therefore it is very evident that only such action has any chance of solving the problem.

If this program of public or co-operative ownership of the Canadian farm machinery industry is not proceeded with, it will be necessary to consider what alternative proposals can be made regarding the private manufacturing sector of the industry.

We would make at least two recommendations in this connection. First, we recommend the establishment of a federal farm machinery prices tribunal with authority, either on its own initiative or at the request of any farm organization or other group, to investigate the price of any farm implement, to determine whether this price is justified by cost of manufacture and if necessary, to rule that the price must be reduced.

Secondly, we recommend the establishment of an advisory technical body possibly attached to the proposed federal farm machinery prices tribunal to maintain a continuous review of the effect of model changes and multiplicity of models on manufacturing costs and also to recommend specific measures of standardization of farm machinery and parts. We believe that no farm machinery price increases should be approved unless the companies have indicated that appropriate measures to standardize production have been taken.

Transport Costs

We have reason to believe that not only have the post-war horizontal freight rate increases imposed an unfair burden on regions like western Canada but even within the region have imposed an unfair burden on farm implements. Therefore, we urge that the board of transport commissioners make a special investigation of railway freight rates on farm machinery to determine whether post-war freight rate increases have discriminated unfairly against movements of farm machinery. If discrimination is found to exist, the Board should order the reduction of such rates to more appropriate levels.

Distribution Costs

We believe that a thorough review of farm machinery distribution facilities should be made. In our opinion, a considerable element of duplication of facilities has added to distribution costs and while much of this could only be eliminated by the effective rationalization of farm machinery production, much could be done by the companies themselves on the regional level. To this end we urge the calling of western Canada and eastern Canada regional conferences representative of the federal government, the provincial governments concerned, the farm machinery companies, farm organizations and representatives of farm implement dealers to work out methods by which costs of distribution could be reduced. We recommend that one of the matters that should be studied is the present dealer appointment policy.

The irksome problem of repair parts supply would be eased by greater standardization of parts, less frequent model changes and other measures we have already suggested.

Public Testing Services for Farm Machinery

Saskatchewan's experience with a farm machinery testing program has indicated that very few new models of farm machines come on the market free from mechanical defects, a problem now being aggravated by the increasing number of models. In addition, it is clear that many farm machines are not designed primarily for Saskatchewan or western Canadian use. Also, the performance of farm machines under specialized conditions that may prevail here is often not indicated by company literature. Therefore, we believe that the Saskatchewan program is of substantial assistance to Saskatchewan agriculture and could be usefully extended to other areas.

We urge the establishment of western Canadian and also an eastern Canadian regional public farm machinery testing agency jointly financed by the federal government and provincial governments concerned. We believe that Saskatchewan's farm machinery testing agency could provide a useful basis for such a western Canadian agency.

Credit Costs

We urge the retention of the Farm Improvement Loans Act on a permanent basis, together with some improvements that will increase the beneficial effect of the operations of this Act. We would particularly urge the elimination of the present discrimination against co-operative farms.

Tariffs

We urge that the policy of tariff-free entry of farm machinery be continued. We believe that the abolition of tariffs on farm implements has been abundantly justified not only in terms of savings to agriculture but in terms of an economic interchange of production particularly between the United States and Canada.

- ¹ Owned land and buildings only.
- ² Secured and unsecured debt.
- ³ Expenses incurred for farm business only.
- ⁴ Repair parts and machine shop charges.
- ⁵ Purchases through commercial channels only.
- ⁶ Pesticides, containers and nursery stock.

TABLE A-11

CHANGES IN FREIGHT RATE ON ASSUMED FARM MACHINE
BRANTFORD, ONTARIO TO REGINA, SASKATCHEWAN, 1948-1960

COMBINE—7,640 lbs. (Freight cost expressed in terms of rate per cwt. and total for machine)

Prior to April 8, 1948:

7,640 at \$1.28 — \$ 97.79

April 8, 1948 (21 per cent increase)

7,640 at \$1.55 — \$118.42

June 16, 1950 (20 per cent increase)

7,640 at \$1.86 — \$142.10

July 24, 1950 (withdrawal of commodity rate)

7,640 at \$1.99 — \$152.04

February 11, 1952 (17 per cent increase)

7,640 at \$2.33 — \$178.01

**May 1, 1952 (Bridge Subsidy allowed—2.53 per cent also 5.8 cents per 100 lbs.)*

7,640 at \$2.21 — \$168.84

**January 1, 1953 (9 per cent increase)*

7,640 at \$2.42 — \$184.89

**March 16, 1953 (7 per cent increase)*

7,640 at \$2.59 — \$197.88

**May 1, 1953 (Bridge Subsidy changed—3.5 per cent also 9.5 cents per 100 lbs.)*

7,640 at \$2.53 — \$193.29

**March 1, 1955 (Equalization Class Rates)*

7,640 at \$2.43 — \$185.65

**January 1, 1957 (11 per cent increase)*

7,640 at \$2.71 — \$207.04

**March 1, 1957 (Bridge Subsidy changed—3.5 per cent also 7.5 cents per 100 lbs.)*

7,640 at \$2.73 — \$208.57

**August 1, 1958 (Base rate changed)*

7,640 at \$2.72 — \$207.81

**December 1, 1958 (17 per cent increase)*

7,640 at \$3.19 — \$243.72

August 1, 1959 (17 per cent reduced to 10 per cent)

7,640 at \$2.97 — \$226.90

**December 1, 1959 (increase in bridge subsidy)*

7,640 at \$2.89 — \$220.80

May 6, 1960 (17 per cent reduced to 8 per cent instead of 10 per cent)

7,640 at \$2.83 — \$216.21

* A tariff was introduced on May 1, 1952, by Board Order 78767 dated April 16, 1952, reducing the rates between eastern Canada and western Canada on traffic via all rail routes passing over Frans, Oba or Hearst. This is now commonly known as the "Bridge Subsidy". It is revised, if necessary, yearly.

The legislation provides a seven million dollar subsidy to the railways to be reflected in a reduction in rates between eastern and western Canada.

A new tariff became effective December 1, 1959, reducing the rates by 4.72 per cent and 15 cents per 100 lbs.

APPENDIX B

ANALYSIS OF AGE OF STOCK OF FARM TRACTORS, SASKATCHEWAN,
1921-1960

This analysis of the age of the stock of farm tractors in Saskatchewan has been prepared on the basis of tractor population on farms as published at five-year intervals in the reports of the census of the prairie provinces and the census of Canada. The number of tractors at the beginning of the inter-censal period plus new tractor sales during the period less the number of tractors at the end of the inter-censal period provides an estimate of scrap-page during the period. For this purpose, it is assumed that there has been no net movement of new or used tractors into or out of the province (see table B-1). On the assumption that the tractors sold first are scrapped first, this estimate of scrappage enabled a table of the age composition of tractors in Saskatchewan to be set up (see table B-2). From this it is a relatively simple matter to calculate the estimated average age of tractors in Saskatchewan at given years on the basis that on June 1, all the tractors sold the previous year are one year old and so on. The average age of tractors, calculated in this manner, rose steadily during the depression and war period from 8.8 years in 1936 to 9.8 years in 1946 and dropped sharply under the impact of heavy post-war buying of tractors to 6.7 years in 1951. Since that time the average age of the stock of tractors has been rising and at particularly steep rate since 1956 to an estimated 9.5 years at June 1, 1960. If the sales of new tractors in 1961 do not exceed by a considerable margin the sales in 1960 we may expect that the average age of tractors will stand at approximately 10 years at June 1, 1961 or the highest lever ever attained.

It should be noted that this calculation of the average age of farm tractors represents a minimum estimate. In actual fact, we should expect that the pattern of tractor scrappage will vary somewhat from that which has been assumed. Some newer tractors will be scrapped before older ones and thus the average age of tractors will tend to be higher, although perhaps only slightly, than the figures presented here.

TABLE B-1

Average age in years...	8.8	9.2	9.8	6.7	7.5	9.5

At the same time there are certain factors that may tend to reduce these estimates or at least to mitigate the effects of them but it will be suggested that these will not be significant enough to change fundamentally the conclusions to be drawn from this study. This would particularly apply to the last decade.

Since the dominion bureau of statistics did not obtain data of farm implement sales on a provincial basis before 1957, the statistics of sales published by Canadian Farm Implements in its issue of January, 1958 have been used for the period from 1921 to 1956. The latter publication obtained the information on which is based its reports from the manufacturers and distributors of farm machinery throughout Canada and accordingly there is a very close parallel between its published statistics and that of the dominion bureau of statistics. However, a comparison for the period 1944-1956 of sales of farm tractors in the prairie provinces as published by the two sources reveals that over the period the D.B.S. records about 3600 more new tractor sales than does Canadian Farm Implements. This, however, is a divergence of only about 1.5 per cent. Even in the unlikely event that all of this divergence could be accounted for in Saskatchewan sales, the results of this study would not be materially affected.

Since until 1958 sales of farm tractors were available on a calendar year basis only it has been necessary to make an estimate of the proportion of sales made by June 1 which is the operative date for census purposes. It is indicated that 58.5, 58.3 and 60.7 per cent of the sales of farm tractors in the Prairie Provinces and British Columbia had taken place before July 1 in 1958,

1959 and 1960 respectively. Accordingly, throughout the study it has been assumed that half of the annual sales of tractors were made before June 1 (see table B-3).

TABLE B-3

NEW TRACTOR SALES, PRAIRIE PROVINCES AND BRITISH COLUMBIA

Percentage of half year of total.....	58.5	58.3	60.7

SOURCE: D.B.S. Farm Implement and Equipment Sales, Quarterly.

Tractor scrappage since 1956 has been assumed to bear the same relationship to new sales as prevailed from 1951 to 1956. In other words, it has been assumed that for every 1,000 new tractors bought 587 old tractors have been scrapped. This may introduce a moderate error into the results for it seems likely that tractor scrappage has been somewhat higher in relation to sales since 1956 than before. If tractor scrappage in relation to numbers on the farm was maintained at the same rate since 1956 as from 1951 to 1956 scrap-page would have exceeded sales and the number of tractors on the farm would have been reduced. There is no evidence to corroborate such a possibility. If for every 1,000 new tractors purchased 1,000 old tractors are scrapped, the average age of tractors on the farm at June 1, 1960 is reduced by one-half year. Such a situation also seems unlikely but remains a possibility.

It is recognized that hours of work performed is a more relevant criterion than age to determine the extent to which the useful life of a tractor has been exhausted. Nevertheless the unavailability of evidence on tractors hours of work makes necessary the reliance on age analysis. There would appear to be no particular reason to quarrel with an assumption that the older a tractor may be the more hours of work it is likely to have performed. Therefore a considerable increase in the average age of tractors could quite legitimately be regarded as an indication of a deterioration of tractor stock.

It is also recognized that the average economic life of a tractor may have been increasing. There is evidence to this effect although there is considerable difficulty in measuring the change. However it is suggested that even if it is true for the longer run it would not operate to reduce to any material extent the trend in Saskatchewan from 1951 to 1960. It should be noted that the federal Department of Agriculture has used over a considerable period the estimate of 10,000 hours of useful life in a tractor.

A factor operating to mitigate the effect of the increasing average age of the tractor population is the trend towards greater horsepower in the new tractors sold.

An even clearer picture of the age of tractors on Saskatchewan farms is obtained by analyzing them in terms of age groups (see table B-4).

TABLE B-4

AGE COMPOSITION OF TRACTOR POPULATION, SASKATCHEWAN

SOURCE: Table B-2.

This indicates that the proportion of tractors five years old and under was less in 1960 than any census year since 1936. The proportion of tractors 11 years old and over has doubled since 1956 and is at the highest point in the post-war period.

APPENDIX C

ANALYSIS OF AGE OF STOCK OF FARM TRACTORS,
PRAIRIE PROVINCES, 1921-1960

Appendix B provides an explanation of the basis of the method followed in estimating the age of the stock of farm tractors. There is one slight difference in sources. As in the case of Saskatchewan sales of farm tractors, the source of information for sales of farm tractors in the prairie provinces for the years 1921-1943 is the trade magazine *Canadian Farm Implements*. However, following the principle of using dominion bureau of statistics information whenever it is available, tractor sales in the prairie provinces from 1944 to 1960 is based on D.B.S. while the source of tractor sales for Saskatchewan from 1944 to 1956 is *Canadian Farm Implements* and from 1957 to 1960 is D.B.S. However it does not seem likely that this will operate to change the result to any considerable extent. Table C-1 indicates that the difference between the total sales as supplied by the two sources is a little more than one per cent.

TABLE C-1
SALES OF FARM TRACTORS, PRAIRIE PROVINCES, 1944-1957

Years	Basis: Canadian Farm Implements	Basis: D.B.S. Farm Implement and Equipment Sales
1944.....	12,407	12,209
1945.....	11,360	11,173
1946.....	12,695	12,250
1947.....	19,045	19,113
1948.....	23,696	25,299
1949.....	35,017	36,006
1950.....	27,962	29,585
1951.....	22,194	22,294
1952.....	21,430	21,755
1953.....	20,536	21,025
1954.....	11,709	11,725
1955.....	10,318	10,097
1956.....	11,036	10,513
Total.....	239,405	243,044

The age of farm tractors has followed a trend similar to that of Saskatchewan although it is indicated that the average age of farm tractors for the whole of the prairie provinces has consistently been below that of Saskatchewan alone. The estimated average age of farm tractors fell from 9.0 years in 1946 to 6.1 years in 1951, rose slightly to 6.3 years in 1956 and rose sharply to 8.5 years in 1960 (see table C-3).

The percentage of tractors 11 years and over dropped from 35 per cent in 1946 to 23 per cent in 1951 to 12 per cent in 1956. However, it is estimated that at June 1, 1960 about 34 per cent of tractors in the prairie provinces were 11 years old or over. It is worth noting that the percentage of tractors five years old and under is the lowest since 1936 (see table C-4).

APPENDIX D

ANALYSIS OF AGE OF STOCK OF GRAIN COMBINES,
SASKATCHEWAN, 1926-1961

The method followed and the sources utilized are the same as indicated in Appendix B in calculating the average age of farm tractors in Saskatchewan with the exception that in the case of grain combines it is assumed that all of the sales in the year have taken place after June 1 of that year. This is borne out by D. B. S. quarterly reports on farm implement sales for the years 1958-1960 which indicate that only a very small proportion of combine sales had taken place in the first two quarters.

Table D-1 sets out the pattern of sales and apparent scrappage of grain combines in Saskatchewan since 1926. This indicates that only in the period 1951-1956 has there been a significant number of grain combines scrapped.

TABLE D-1

Average Age in Years...	6.9	7.3	7.5	7.0	7.9	9.7	10.1

¹ All combines are presumed to be bought after June 1. Therefore those combines classed as one year old have been through one harvesting season, although technically they are not yet one year old.

It would appear that the average age of combines in Saskatchewan has shown less fluctuation than that for tractors declining only slightly from 1946 to 1951 when the average age of tractors was dropping by about one-third. However, the average age of combines has shown the same upward trend from 1951 to 1956 and from 1956 to 1960 as that of tractors having climbed to an estimated 9.7 years at June 1, 1960 and being expected to reach over 10 years at June 1, 1961 (see table D-2).

The percentage of combines in Saskatchewan over ten years old has climbed sharply from 20 per cent in 1956 to 39 per cent in 1960 (see table D-3) again showing a trend similar to that of tractors.

APPENDIX E
ANALYSIS OF AGE OF STOCK OF GRAIN COMBINES,
PRAIRIE PROVINCES, 1926-1961

The method followed and the sources utilized are the same as those followed in analyzing the age of tractors for the Prairie Provinces (see Appendices B and C).

Again as in the case of tractors, the average age for combines in the prairie provinces as a whole is indicated as being lower than that for Saskatchewan alone although similar trends are exhibited (see table E-2). In the same manner the age composition of combines shows a similar increasingly heavy concentration of older combines (see table E-3).

TABLE E-1
COMBINES ON FARMS, NEW SALES AND APPARENT SCRAPPAGE,

APPENDIX F

ANALYSIS OF RETURNS ON INVESTMENTS OF TWO FARM
MACHINERY COMPANIES AND OF GROSS OPERATING PROFIT
IN CANADIAN FARM MACHINERY INDUSTRY

This analysis of the earnings and dividends of Cockshutt Farm Implement Company and Massey-Ferguson Limited is a continuation of the financial study of these companies done in 1952 for the select special committee on farm machinery of the Saskatchewan legislature, by the accounting firm of Messrs. Millar, Macdonald and Company. The same general method has been followed. Except for certain minor changes, the figures for the years 1947 to 1951 have been taken from the 1952 study. Data for the years after 1951 has been obtained directly from the published annual financial reports of the two companies.

The following notes apply to the statements included in this study:

1. Invested capital comprises common and preferred capital stock, earned and deferred surplus, bonds and surplus reserves (inventory, contingent, and pension). The invested capital shown is the average of the balance at the end of the fiscal year and the balance at the beginning of the fiscal year.
2. Stockholders' investment is invested capital as defined in note 1 less the average of bonds outstanding at the end and beginning of the fiscal year.
3. The profits shown under invested capital are the published profits adjusted for non-operating items (provision for contingencies etc.) plus bond interest. For instance, in the year 1955 Massey-Ferguson's adjusted net profit before tax of \$16,982,530, shown under invested capital, is made up of \$13,396,031 (profits before income taxes) plus \$1,870,891 (interest on funded debt) plus \$1,715,608 (pension costs).
4. The profits shown under stockholders' investment are the profits adjusted as in note 3 but with bond interest deducted.
5. In calculating the capital stock paid up per share and profits per share, the number of shares used is the actual number outstanding at the end of that fiscal year (adjusted as will be indicated to reflect stock splits).
6. The number of shares outstanding has been expressed throughout in terms of 1960 stock equivalent. Calculations of earnings per share in the years 1947 to 1951 inclusive are based on the 1952 committee report but they have been adjusted to 1960 stock equivalent terms.
7. All averages shown are weighted.
8. In the Massey-Ferguson statement, (table F-3), the full amount of the deductions for pension provisions for each year, which the company deducted from income account, has been added back to profits as it is not known what amount is needed to meet actuarial requirements. The pension reserve account on the consolidated balance sheet has been added to surplus to determine investment.
9. In the Cockshutt statement, the 1954 loss is shown as greater before taxes than after taxes. This is due to the recovery of taxes paid the previous year, the whole of which was added back in 1954.

The conclusions which may be drawn from the financial statements of the two companies regarding profits on farm machinery sales must be modified by a number of considerations. The most important of these is that the number of subsidiary companies included in the consolidated statements have changed from time to time. This is particularly true of Massey-Ferguson, which, because of its program of expansion, has changed its basis of consolidation from a North American one to one including subsidiary companies operating in many

parts of the world. For instance, up to 1953, Massey-Ferguson's financial statements covered operations in only the United States and Canada, but since 1956 North American sales have made up less than half of total sales of the Company. North American sales in the 1956-1960 period ranged from 33.5 per cent to 45.8 per cent of the total world sales by the company. In the same period the Canadian market provided an average of 11.5 per cent of total Massey-Ferguson sales, ranging from 9.6 per cent to 12.7 per cent. The extent to which changes in the profit picture might be obscured by this is indicated by the statement that Massey-Ferguson would have declared a loss of over \$1 million in 1956 if they had not changed from a North-American to a world-wide basis of consolidation.¹

A second factor which complicates any analysis of the returns realized from the manufacture of farm machinery is the considerable proportion of non-farm items produced by farm machinery companies. For instance, defense production made up a significant part of Massey-Ferguson's sales during part of the last decade (see table F-1). In addition, sales of diesel engines, outboard motors and other products were also made (see table F-2).

United Kingdom	National Institute of Agricultural Engineering, Wrest Park, Silsoe, Bedfordshire.
United States	Nebraska Tractor Testing Station, University of Nebraska, Lincoln, Nebraska, U.S.A. (Tractors only and excluding field testing)
Yugoslavia	Institute for Agricultural Mechanization, Prilaz J.N.A. 83, Nagreb.

Mr. I. C. NOLLET (*Minister of Agriculture, Province of Saskatchewan*): Mr. Chairman and members of the committee, there is one thing that we have in common and that is getting our committees together on time. I noticed your committee is doing quite well and that there is a good representation here.

I want to say first of all that we are very pleased to be here, and to give you information that should be of help to the committee in examining this very important field. In order to expedite matters—I know what your time is like—I have this brief opening statement, or covering statement. Then I thought we might go through the main brief section by section, and any member who wishes to ask any questions with reference to a particular section could ask those questions. In that manner we might be able to cover the main body of the brief more quickly and more comprehensively.

I have with me Mr. Kyle, director of the agricultural machinery administration. This is an agency that was set up as a result of our own inquiry and subsequent recommendation. This is also the agency which carries on the testing of farm machinery, so if any of you have any questions to ask with reference to our legislation and the testing of machinery, Mr. Kyle would be very pleased to answer.

Mr. PASCOE: Is this opening statement one which covers the whole brief?

Mr. NOLLET: The opening statement is a condensation of the main brief. With reference to anything contained in the brief, Mr. Wenaas, the economist with the economic advisory and planning board would be prepared to be of help to you, and answer any questions in connection with the brief and the statistical material contained therein. I shall read now this covering statement.

I very much appreciate the opportunity to make this submission regarding farm machinery prices on behalf of the Government of Saskatchewan to this Committee.

In our view, the question of farm machinery prices cannot be separated from the basic problem of the farm cost-price squeeze and thus in the present economic circumstances the price of farm machinery has become a matter of urgent concern not only to agriculture but to the Canadian economy as a whole.

As we have indicated in Section I of our brief, there has been since 1948 a growing disparity between farm product prices and farm costs generally. The index of farm prices of agricultural products in Saskatchewan has dropped 14 per cent since 1948 (on basis of estimated final grain prices for 1960) while the composite index of farm costs for Western Canada (exclusive of living component) has climbed by 43 per cent. It is true that farm prices generally rose from 1948 to 1951 (with the most important exception being wheat) but

even during that period farm costs rose faster. After a period of slight declines in farm costs from 1952 to 1955 when farm prices were dropping most steeply, farm costs have continued to rise and are now considerably above the 1951 levels while farm prices are lower than in 1951. Steadily and inexorably this price-cost vise has been tightening.

For Saskatchewan agriculture the problem assumes more critical proportions since the price of wheat, the most important single commodity in the provincial agricultural economy, did not rise even in the 1946-51 period when most other farm products did show price increases. Farm machinery prices have increased more rapidly than other farm costs so that the relationship between wheat prices and farm machinery prices has registered a truly phenomenal change.

Thus, while the general indices of farm prices and farm costs in Saskatchewan indicate that a unit of farm production was worth, in terms of general farm costs, only 60 per cent in 1960 of what it was in 1945, a bushel of wheat in 1960 (assuming interim and final payment of 22 cents per bushel for the 1960-61 crop year) will buy only 38 per cent of what it would buy in 1945 in terms of farm machinery. In other words, if it took 1,000 bushels of wheat in 1945 to buy a unit of farm machinery it would on this basis require 2,600 bushels of wheat to buy the equivalent unit in 1960. This represents only the average situation according to the D.B.S. indices. For particular farm implements the situation is considerably worse.

Of course, had the prices of farm products advanced in common with other prices in the Canadian economy, increases in farm costs and more specifically in farm machinery prices would not be such a heavy burden. But despite the fact that agriculture has shown the most rapid increase in productivity of any sector of the Canadian economy in the post-war period, income going to agriculture has lagged behind that of the rest of the nation. The reason for this is that farmers have very little control over the selling prices of their products in contrast to many other industries which are dominated by a few firms and able to maintain prices at a high level. Thus, although any reductions in farm machinery prices would have important benefits, the full benefits would not be realized unless fundamental changes in marketing and pricing policies are adopted by the Federal Government to enable agriculture to obtain a fair share of the national income.

We have noted the very considerable increase in the share of farm cash income required to meet the farm machinery bill (machinery operating costs and depreciation charges). In Saskatchewan this has climbed from under 20 per cent in the immediate post-war period to an average of 32 per cent in the period 1955-1959. We would also note that although in Saskatchewan in 1959, one-fifth of farm cash income available after the deduction of farm costs and operating expenses went for farm machinery purchases (the second highest proportion of any year in the post-war period) this was not sufficient to maintain the stock of farm implements.

This effect of sharply reduced farm income and rising farm machinery prices is of special concern since no industry today can long continue to produce efficiently if its capital equipment is wearing out and is not being replaced at sufficient speed.

It is quite clear that since 1954 there has been a very marked deterioration in the condition of farm implements and equipment in western Canada. The estimated value of the stock of farm implements has fallen in just five years (1954-1959) by \$166 million for the prairie provinces and \$93 million for Saskatchewan alone. Also the estimated average age of tractors in Saskatchewan has risen from 7.5 years in 1956 to 9.5 years in 1960. The estimated average age of combines in the province has increased from 7.9 years to 9.7 years in the same period. Similar trends are shown for the prairie provinces.

Obviously sales of farm machinery have been very much below replacement levels. This is also indicated by the fact that at the present average annual rate of sales since 1956 it would take 27 years to replace the present stock of tractors in Saskatchewan and 30 years to replace the combines.

One of the most startling facts is that at June 1 of last year 34 per cent of the tractors in the prairie provinces and about 45 per cent of the tractors in Saskatchewan were eleven or more years old. At the same time, it is estimated that about 36 per cent of the combines in the prairie provinces and 39 per cent of the combines in Saskatchewan were over ten years old.

Thus, the problem of farm machinery prices is particularly important at the present time since it is necessary not only to fill the ordinary annual requirements for machinery replacement but there is a heavy backlog of demand to catch up on.

We believe that there are five principal areas in which reductions in farm machinery costs might take place, (1) at the manufacturing level, (2) in transportation, (3) in distribution, in the realm of credit costs and then once in the farmers' hands in the degree of efficiency with which the machine is employed and its suitability and durability.

First of all, we maintain that federal measures to assure the maintenance of a stable and high level of farm income would contribute as much as any other factor to the most economic production of farm machinery. Farm machinery manufacturing and distribution facilities are set up to handle peak demand. When there is a sharp drop in sales, overhead costs continue at much the same level and result in a considerable increase in the per unit manufacturing and distributions costs. In our opinion, it is essential that major fluctuations in farm income be eliminated as much as possible through establishment of an expanded program of orderly marketing, a pricing program for farm products relating prices to costs of production and assuring agriculture of a fair share of national income, an adequate federal crop insurance program to eliminate the effect of weather on farm income as much as possible, and other related costs.

Factory Prices of Farm Machinery

It is also imperative to determine the actual factory cost of farm implements in the post-war period. A special select committee of the Saskatchewan legislature was unable to do this in 1952 because of the refusal of the privately-owned farm machinery companies to supply necessary information. Therefore, we urge the House of Commons committee to conduct a thorough analysis of the accounts of the farm machinery companies to determine to what extent farm machinery prices have been justified by manufacturing costs and to determine the profit levels of the industry. We have submitted evidence concerning two of the farm machinery companies indicating that over the whole of the post-war period these companies have realized a rate of return that has been more than adequate.

In our view, a most important area for reduction in farm machinery costs lies in rationalization of farm machinery production and distribution. In Saskatchewan today there are nine major manufacturers of farm machinery offering complete lines of equipment. The cost of maintaining nine headquarters staff, nine research organizations, nine assembly lines turning out nine sets of machines designed to do the same thing, nine advertising and promotional campaigns and nine systems of dealerships, is surely too much for an agricultural economy caught in the vise of a cost-price squeeze to bear.

At the same time, even within individual firms the multiplicity of models and increased model changes would appear to have raised manufacturing as well as distribution costs. Industry policies of "planned obsolescence" are also raising costs.

Rationalization of the industry would result in savings through the standardization of farm machinery and parts, savings through the reduction in the total number of farm machinery models, savings through the elimination of unnecessary model changes and savings in distribution. The first of these was recommended by a House of Commons committee almost a quarter-century ago but we have seen only a few signs of this being achieved by the industry. Indeed we would suggest that the individual farm machinery companies have a vested interest in discouraging such a program and therefore it seems unlikely that any very substantial standardization of farm machines and parts could be realized without direct government controls of some kind. We would also note that the problems of multiplicity of models and overly frequent model changes are a product of recent trends in company merchandising policy.

It is obvious that these savings, which should result in lower prices, cannot be realized without thorough reorganization of the industry. In the light of the inability or unwillingness of the industry itself to accomplish this, public intervention and regulation is essential.

Recommendations

Therefore, we would urge the Committee to consider a three-fold program under which public, private and co-operative ownership of farm machinery production and distribution facilities could be used to serve Canadian agriculture. This would involve the nationalization of the Canadian privately-owned farm machinery industry. An alternative would be loans to enable a enlarged co-operative farm machinery industry to be established.

Any national agency set up to manufacture and distribute farm machinery in Canada would of necessity have to be the sole importing agency of farm machinery also. Such an agency could either establish its own system of distribution or provide for the development and expansion of farmer-owned co-operatives and perhaps also employ in some instances the private distribution agencies.

These recommendations may appear to be drastic but it is sadly evident that the present system of farm machinery manufacture and distribution has failed to provide Canadian farmers with machinery at reasonable prices. Therefore we consider that such action has the best chance of completely rationalizing the industry. With reference to the third alternative, if this program of public or co-operative ownership of the Canadian farm machinery industry is not proceeded with, it will be necessary to consider the third alternative which can be made regarding the private manufacturing sector of the industry.

We would make at least two recommendations in this connection. First, we recommend the establishment of a federal farm machinery prices tribunal with authority, either on its own initiative or at the request of any farm organization or other group, to investigate the price of any farm implement, to determine whether this price is justified by cost of manufacture and if necessary, to rule that the price must be reduced.

Secondly, we recommend the establishment of an advisory technical body possibly attached to the proposed federal farm machinery prices tribunal to maintain a continuous review of the effect of model changes and multiplicity of models on manufacturing costs and also to recommend and establish specific measures of standardization of farm machinery and parts.

Transport Costs

We have reason to believe that not only have the post-war horizontal freight rate increases imposed an unfair burden on regions like western Canada but even within the region have imposed an unfair burden on farm implements. Therefore, we urge that the board of transport commissioners make a special

investigation of railway freight rates on farm machinery to determine whether post-war freight rate increases have discriminated unfairly against movements of farm machinery. If discrimination is found to exist, the board should order the reduction of such rates to more appropriate levels.

Distribution Costs

We believe that a thorough review of farm machinery distribution facilities should be made. In our opinion, a considerable element of duplication of facilities has added to distribution costs and while much of this could only be eliminated by the effective rationalization of farm machinery production, much could be done by the companies themselves on the regional level. To this end we urge the calling of western Canada and eastern Canada regional conferences representative of the federal government, the provincial governments concerned, the farm machinery companies, farm organizations and representatives of farm implement dealers to work out methods by which costs of distribution could be reduced. We recommend that one of the matters that should be studied is the present dealer appointment policy.

The irksome problem of repair parts supply should be eased by greater standardization of parts, less frequent model changes and other measures we have already suggested.

We believe this House of Commons committee should examine and report on present discounts on machines and repair parts by various types of machines.

Public Testing Services for Farm Machinery

Saskatchewan's experience with a farm machinery testing program has indicated that very few new models of farm machines come on the market free from mechanical defects, a problem now being aggravated by the increasing number of models. In addition, it is clear that many farm machines are not designed primarily for Saskatchewan or western Canadian use. Also, the performance of farm machines under specialized conditions that may prevail here is often not indicated by company literature. Therefore, we believe that the Saskatchewan program is of substantial assistance to Saskatchewan agriculture and could be usefully extended to other areas.

We urge the establishment of a western Canadian and also an eastern Canadian regional public farm machinery testing agency jointly financed by the federal government and provincial governments concerned. We believe that Saskatchewan's farm machinery testing agency could provide a useful basis for such a western Canadian agency.

I want to make it clear that we are not blowing our horns about this testing agency at all. We point out that it has certainly justified itself. It has been eminently successful and very well received by the farm population. The test reports are in great demand and have proven to be very beneficial.

Credit Costs

We urge the retention of the Farm Improvement Loans Act on a permanent basis, together with some improvements that will increase the beneficial effect of the operation of this act. We would particularly urge the elimination of the present discrimination against co-operative farms, and groups of farmers who co-operate in the matter of machinery.

Tariffs

We urge that the policy of tariff-free entry of farm machinery be continued. We believe that the abolition of tariffs on farm implements has been abundantly justified not only in terms of savings to agriculture but in terms of an economic interchange of production particularly between the United States and Canada.

This, gentlemen, concludes the brief. Thank you very much for your kind attention.

The VICE-CHAIRMAN: Gentlemen, you have heard the summary, which has been presented by Mr. Nollet.

We will now accept questions on section 1 of the main brief, the nature of the problem, patterns of farm mechanization, impact of farm machinery prices on farm costs, the state of capital investment in farm implements, and possible reduction in farm machinery costs; or you may ask any general questions regarding this brief.

Mr. MUIR (*Lisgar*): In your brief, Mr. Nollet, you indicate you would like to see the nationalization of this industry. Would you say this, after the experience your government has had in government-owned utilities and industries, such as your plants which have had to close down?

Mr. NOLLET: The arguments in respect of nationalization here probably would be much different than they are in terms of other publicly owned utilities. With reference to power, the experience has been very good.

Mr. MUIR (*Lisgar*): I am speaking about factories.

Mr. NOLLET: The sodium sulphate has been successful. The only reason it became a public enterprise was because no one else was particularly interested in the development. It has done very well.

This is a very drastic recommendation in terms of the general concepts of people. My argument would be that there are two things wrong the first of which is that machinery prices are too high, regardless of the number of inquiries which have been made from 1936 and 1937 right up to the present. Nothing has been achieved in the field of bringing down the price of farm machinery, or in the alternative bringing up the price the farmer receives for his commodities.

In order to try to help the farmers in their unfavourable economic relationship the government has provided many services in research, experimental farms, and so on to improve the farmer's income. We have spent a lot of money. Where we should assume some responsibility is in protecting the farmer in the cost of the machines or bring his prices up. I know this is a drastic step, but with several machine companies competing with each other it is very difficult for them to rationalize. Some other agency must assist in this rationalizing, either by getting in the field itself, either government or co-operative, or a regulatory body that will provide the necessary rationalization. If Massey-Ferguson, for instance, went out on its own and tried to do something it would still have to face its competitors. In reference to distribution, whatever is done there should be done across the board.

The VICE-CHAIRMAN: Would you get back to the question which was asked?

Mr. MUIR (*Lisgar*): I imagine there will be other questions on this, and I would like to carry on with my thought on this particular point of nationalization. One of the machine companies that gave evidence before the committee said that only twelve per cent of its production was sold in Canada. On top of that we also had evidence that eighty-five per cent of the machinery that is sold in Western Canada is made in other countries. I would like you to give me the benefit of your experience, if you are going to nationalize an industry which is going to be in competition with machinery coming in, which is eighty-five per cent of the machinery sold in western Canada.

Mr. NOLLET: If we can achieve anything by nationalization in terms of reducing prices, then I would think that the machines which come in from the outside would have to meet that competition and would have to be reduced in price. As you know, the machine companies have been meeting that competition when selling machines abroad.

Mr. MUIR (*Lisgar*): What makes you think that nationalization will reduce the price so that they have to meet the competition. They may be able to undersell you.

Mr. NOLLET: By manufacturing machines on the basis of utility and not changing models so frequently. In this field I think we might be able to make substantial sales.

Mr. MUIR (*Lisgar*): Do you not think that by barring any changes in models you are going to slow down the proper mechanization of the agriculture industry? A lot of these model changes are demanded by farmers themselves who want to be able to farm at less cost. A lot of these changes bring this in. If you are going to cut down on model changes you are simply going to keep the thing static.

Mr. NOLLET: I am thinking of model changes in terms of unnecessary changes which really do not make the machine more useful or do a more efficient job. I would think that any manufacturer, particularly a publicly-owned one, would want to design a machine for the purpose intended and do nothing that would in any way discourage design of machinery which would do a more adequate job for a specific purpose.

Mr. KORCHINSKI: Could you list any of these unnecessary changes of which you speak?

Mr. NOLLET: Changes in cowling and changes in the design of an engine which has no relationship to its efficiency and output of horsepower, and so on.

Mr. KORCHINSKI: Could you be a little more specific?

Mr. NOLLET: Changes in the general design of the cowling and general appearance and the tendency to put out a machine that is more attractive and will sell better, much in the same manner as designs are changed in automobiles; also the changes in engines which have no relation to the output of efficiency of horsepower. These are things which I do not think are vital. Nothing ever should be done that would in any manner discourage any inventive genius, or changes in design that are necessary in order for a machine to do a more economic job, which is its intended purpose.

Mr. MUIR (*Lisgar*): Up to the present Mr. Nollet has not answered one question I asked; that is, why does he think that nationalization of industry will reduce the price of farm machinery.

Mr. NOLLET: For the reasons I mentioned. I think we can get more rationalization in both the manufacture and distribution, particularly if the distribution was done through a co-operative organization. That has been demonstrated in our province by C.C.I.L. They have reduced costs greatly. I think we can save money in this manner.

Mr. MUIR (*Lisgar*): I think it has been the experience of government that every time they get into a business the operation of the business costs more.

Mr. NOLLET: The only answer I can give you is we have the evidence that farm machinery prices zoom skyward and we think they are too high. Maybe aside entirely from the relationship of farm prices they are still too high, but when taken in conjunction with farm prices they are extremely high. We have given you an alternative proposal. It is within the competence of this committee to determine whether you think nationalization will save money. If you think it will not, and if it can be done in another way, we are quite agreeable, just so that it is done.

Mr. HORNER (*Acadia*): I understood we were to proceed with section I. Nationalization is a very important subject, and I do not want to say that it

is not, but it does not come under section I, to my knowledge. I think we should proceed along much more orderly lines and deal with the sections as they turn up.

The VICE-CHAIRMAN: That is not a point of order, as I said we were going to section I. If anyone has a question on the whole brief, I will take that. Mr. Muir brought up the point of nationalization. When that is settled, we will go to section I.

Mr. KORCHINSKI: Is it agreed that we continue on this line of questioning?

The VICE-CHAIRMAN: Yes, on nationalization, and then on section I.

Mr. KORCHINSKI: On page 5 of the brief it says there are nine major manufacturers of farm machinery offering complete lines of equipment, with the cost of maintaining nine headquarters staff, nine research organizations, nine assembly lines turning out nine sets of machines designed to do the same thing, nine advertising and promotional campaigns and nine systems of dealerships.

The converse of that is that if you had only one machinery company advertising or selling machinery, you would then suggest that it would bring the price down. Is that what you are suggesting?

Mr. NOLLET: Not necessarily one manufacturing agency, but we are saying that we think there is unnecessary duplication, and that every one of these companies has a dealer established and varying company-dealer contract relationships, and if at least an agent could handle several lines of machinery—

Mr. KORCHINSKI: How many are you going to allow?

Mr. NOLLET: As many as he wants to handle.

Mr. KORCHINSKI: You have nine here.

Mr. NOLLET: We have nine companies. As you go through many towns in Saskatchewan you find nine dealers establishments, each handling a separate line. It is a restriction imposed upon most of the dealers. The market simply is not there. He cannot provide the service or the stock of repair parts necessary.

We think you might give some study to the possibility of an agency handling several lines of machinery in a particular area. We might also set up regional repair depots.

Mr. KORCHINSKI: When I go to buy a machine I go from one dealer to the next one, and I buy the machine that the dealer suggests to me is going to be the lowest price for myself. If I have nine dealers, that will bring the price down from one dealer to the next one; but if there is only one dealer, I have to go to that one and pay whatever price he asks.

Some Hon. MEMBERS: Hear, hear.

Mr. NOLLET: This works in the other direction, also. You go to a small dealer who is in competition with a big dealer and the big dealer can give you a much better deal on trade-ins and a much better deal generally. The little dealer tries to compete with him, and in doing so he loses all of his commission, but the fact of the matter is that no matter where you make the deal the percentage allowance for your dealer still remains the same. It is the dealer who is taking the rap, and no one else. He gives up his commission when he gives you a good deal as against someone else. This is the problem. Then he is left in an embarrassing financial position. He cannot provide the kind of service necessary to the operation of that machinery.

Mr. KORCHINSKI: If you have a monopoly under a nationalization program such as you suggest, the dealer remaining in there cannot make a decision

and he is impersonal. I know a whole lot of dealers and they will give me a good deal. A man will sacrifice another \$25 to give me a deal because he personally feels that I am an asset to that community; but if you nationalize it this person does not care who I am.

Mr. NOLLET: There is no suggestion in my mind regarding the nationalization of distribution. That is not necessary. We are thinking in terms of manufacture.

Mr. HORNER (*Acadia*): You said nationalization of everything, in the brief.

Mr. NOLLET: The cooperative distribution is an alternative.

Mr. KORCHINSKI: An alternative? In other words, all that you want is cooperative distribution? That is all? One company to handle everything?

Mr. NOLLET: We have given three alternatives—public manufacture, distribution cooperatively, and—

Mr. HORNER (*Acadia*): On a point of order. On page 6 of this covering statement, you state:

Any national agency set up to manufacture and distribute farm machinery in Canada would of necessity have to be the sole importing agency of farm machinery also.

You state there "any national agency set up to manufacture and distribute". Now you state that the distribution can be by cooperation. I am pointing out that is quite clear that your recommendation says "manufacture and distribute".

Mr. NOLLET: Then it says this:

Such an agency could either establish its own system of distribution or provide for the development and expansion of farmer-owned cooperatives and perhaps also employ in some instances the private distribution agencies.

I personally could not see any logic in the manufacturer getting into the distribution field, whether a private manufacturer or a government manufacturer, no more than at the present time. I think co-operative distribution would fit the bill very adequately.

Mr. SLOGAN: Do you not think that before we start nationalization in other industries, perhaps the agricultural industry had better set its own house in order. For instance, in an area of my province, an independent study showed that the land could support only one-fifth the number of the farmers farming on that land. Do you not think that before we start imposing restrictions on other industries, industry might turn around and say to us: "Why do you not get rid of the other 80 per cent of the farmers, to make these farm units economic?" And supposing they do, would you be in favour of that?

Mr. NOLLET: I just have one reply to make to your question. You are suggesting that the submarginal farmer is the big problem, the man living on poor land. This is not so. The fundamental problem facing the farmers faces the farmers on the good land, the cost price squeeze. This is it. It is not those farmers who live on the submarginal land. I suggest to you that you could improve the lot of all of them and provide a good normal living for some of the people on submarginal units by increasing his prices.

Mr. SLOGAN: Are you suggesting that the fellow on the small uneconomic unit is utilizing his machinery to full efficiency and capacity?

The VICE-CHAIRMAN: Order. Mr. Rapp has a supplementary question.

Mr. RAPP: I am very interested in the point about the co-operative farm machinery industry. To a certain extent we have this established already. Would your suggestion be to have it established on a national scale? Would

that be interfering with some provincial jurisdiction or provincial rights? Would you elaborate on that point? I am sure farmers are interested in this co-operative farm machinery because they have quite a large amount of members in the C.C.I.L. I would like if you could give a direction along these lines of your thinking, as to have to implement this farm co-operative machinery industry on a national scale.

Mr. NOLLET: There is a recommendation made here that certainly this has real merit and that a very good answer can be obtained in terms of nationalization in both the manufacture and distribution of farm machinery, if it could be done on a co-op basis. I think we have recommended that the committee consider recommending to the government that we make financial assistance available to the co-operators to expand the existing services to a national basis. There is no reason why it could not be done, and very substantial savings made. One of the good things about it is that any savings made are widely distributed. If this is done, I cannot see any justification for nationalization—if this were accepted.

Mr. RAPP: Would it interfere with provincial rights?

Mr. NOLLET: No.

Mr. RAPP: Or jurisdiction?

Mr. NOLLET: No.

Mr. COOPER: We have a co-op dealer in Saskatchewan that handles a Cockshutt combine. You cannot buy the Cockshutt combine any less from them than you can from your dealer, and you do not get the service on that Cockshutt combine that you do if you buy direct. You get a slip of paper from the co-op giving you so many more shares in the co-op, but you have to do your own servicing.

Mr. NOLLET: I would not say that. The co-op are trying to set up an inexpensive and rational system of distribution of farm machinery, and servicing it. They are working in the direction of regional repair depots, but they do not have enough volume of business to make this eminently successful. I think they are on the right track. As you know, at one time years ago when C.C.I.L. first organized in the depression, Cockshutt offered to sell out to them. Their big mistake was that they did not buy Cockshutt out at that time. Now Cockshutt is in competition with them and they are in competition with Cockshutt and that makes a pretty undesirable situation.

Mr. FORBES: How would you proceed under a system of free enterprise to give one company a monopoly on the manufacture and distribution of farm machinery?

Mr. NOLLET: I do not think you would want to do so. I think that if we proceed on the present basis of private manufacturing with the major companies and then some smaller ones, and if you would give consideration to setting up a type of tribunal, a continuing administrative organization that would analyse manufacturing costs and costs of distribution, constantly keeping these under observation, we could then have some uniform agreement on such points. One of these points is that there are too many model changes and useless duplications. We could get them together and provide for interchangeability of some of the fast moving parts. I think much could be achieved in this way. With our present set up, we could have an over-all government agency to give uniform direction to this. Take for example the milk control boards in the various provinces. These have worked very effectively and they can work effectively without putting any restrictions or restraints on business enterprise, other than to make it more rational and to reduce costs, both at the manufacturing and the distribution levels. I think it can be done.

This is the alternative proposal that we make. I am having due regard to everyone's economic philosophies. We know there are questions here of philosophies and politics and everything else. For this reason we give you the choice, but whatever is done we would like to see this objective accomplished with farm machinery, so that it would be brought down to the lowest possible price, and that it be good machinery and manufactured for the purpose intended.

In this connection, you could set up a farm machinery testing organization. That would have a salutary effect on this tendency towards duplication, with model changes and a multiplicity of repair parts, and so on. I think we could get some uniformity.

The VICE-CHAIRMAN: I think we have covered this enough now.

Mr. DANFORTH: Can we proceed with the general statement?

Mr. HORNER (*Jasper-Edson*): On section I, I would like to ask the director of the machinery administration, in regard to page 16, where there is talk about the life of tractors, and so on. Now, one of the farm machinery companies which gave evidence before us claimed that the present tractor they were manufacturing had a longer life and, in fact, was a better tractor in this regard than previous tractors. Does this account for some of the reason why the average age of tractors in the west is getting bigger?

Mr. KYLE: With respect, Mr. Wenaas might reply to that. He did the analysis.

Mr. C. J. WENAAS (*Economist, Economic Advisory and Planning Board*): I recognize that when representatives of Massey-Ferguson appeared before the committee they indicated that the average life of a tractor was somewhat above this. Now, this is based on a study by a federal department of agriculture, done by Mr. M. K. Scott in 1950, a study of about 450 or 500 farmers in Alberta. Now, if there have been any changes since that time, they would not be reflected in the study made by Mr. Scott. However, we felt it was advisable to base our statements about the estimated average life of tractors on a formal study conducted by the federal department of agriculture.

Mr. HORNER (*Jasper-Edson*): What I particularly wanted to know is if your testing program in Saskatchewan has verified the fact that tractors do live a longer life, or do you do such testing?

Mr. WENAAS: The answer to that would be that we do not do tractor testing.

Mr. HORNER (*Jasper-Edson*): From your testing program, have you made any observations or recommendations to the companies with regard to the question of obsolescence, with regard to the question of unnecessary frills, and with regard to the question of standardization? Have you, as a director of the A.M.A. testing program, made any recommendations to the farm machinery companies whose machines you are testing, on these three points?

Mr. KYLE: I think the answer specifically would be no. In the general term—

Mr. HORNER (*Jasper-Edson*): Do you intend to do so in the future?

Mr. KYLE: I think so, but perhaps not exactly in that way. The individual items which come before us for recommendation in the reports might point to that from time to time, but not specifically, if this is what is in your mind.

Mr. HORNER (*Jasper-Edson*): You recommend a national program of testing. Do you feel this might be one area in which a national machinery testing program could undertake the study of these particular problems, as well as the design, usefulness, and so on of machinery? Do you think a national testing program could have some benefit in dealing with these problems, obsolescence, unnecessary frills and standardization?

Mr. KYLE: I think quite effectively, sir.

Mr. HORNER (*Acadia*): This is an old argument with me, but perhaps we can readily do away with it. At the top of page two of the brief you state that farm prices have fallen since 1951. Then, in the middle of the page, you have a table showing an agricultural price index for products in Saskatchewan. In 1951 the index was at a high of 139, and it dropped to a low of 104 in 1957. Then, from that period onwards, there is a reversal to some extent, particularly in the last three years. Do you agree with that?

Mr. WENAAS: Yes. As a matter of fact we do not claim in the brief that farm prices have fallen steadily since 1951. They have fallen since 1951—

Mr. HORNER (*Acadia*): I see.

Mr. WENAAS: —and there has been some minor adjustment upwards since 1955 in one case, and also since 1957 in another.

Mr. HORNER (*Acadia*): If you were drawing a graph the low point would be in 1957?

Mr. WENAAS: Yes. It went up in 1955-56, went down from 1956 to 1957, went up again in 1958-59 and down again slightly in 1960.

Mr. HORNER (*Acadia*): Very slightly. I have another question following on that. At page 16 of the brief you go into the age of tractors, the reduction in their purchase and so on, pointing out quite clearly that Saskatchewan has not repurchased or not replenished its supply of agricultural implements to a certain extent. At the moment I am looking at the Saskatchewan economic review, put out in March 1961, and on page 13 of that review there is a table which shows farm implement sales, for Canada and Saskatchewan, in millions of dollars. Going down over the chart I see that the high years of farm implement purchases—that is, of new implements—in Saskatchewan were 1951, 1952 and 1953. In fact, there were four years in which purchases were fairly high, from \$60 million to \$80 million. Then there was a substantial drop and they remained relatively below \$40 million for the next four or five years but, in 1958, 1959 and 1960 purchases of new machinery went up—in 1959 to \$50 million and in 1960 to \$54 million. Would you agree that in recent years the stock of farm implements in Saskatchewan is starting to be replenished?

Mr. WENAAS: No. These estimates of the value of farm implements and equipment for Saskatchewan and also for the prairie provinces are based on D.B.S. estimates, and these show a constant decline from 1954 to 1959, which is the latest available year for which these estimates have been provided. I would estimate that on the basis of 1960 sales there would be a further decline in the value of farm implements and equipment on the farms, in both Saskatchewan alone and in the prairie provinces together, although the decline will probably not be as great as the average decline from 1954 to 1959.

Mr. HORNER (*Acadia*): I have a few further questions on the same subject. Would it not be true that with the fewer number of farms in Saskatchewan there would be a tendency to have fewer purchases of new equipment?

Mr. NOLLET: I would say not. You have the same amount of land to work. Mr. Horner, I think the important point to remember with regard to farm prices is that while they have made a slight upturn in recent years, they have never got back to where they were.

Mr. HORNER (*Acadia*): I quite realize that.

Mr. NOLLET: The unrelated factor is crop failure. In 1954 rust was prevalent and after that purchases of farm machinery dropped very sharply.

Mr. HORNER (*Acadia*): In other words, you disagree with the assumption I am making that fewer farms means fewer purchases of agricultural machinery, and that farmers tend to make greater utilization of the machinery they have?

Mr. NOLLET: You would think so.

Mr. HORNER (*Acadia*): You would have fewer people purchasing if there were fewer farmers.

Mr. WENAAS: May I add a point in that regard? It is recognized that eventually there will be stabilization of the number of tractors used in Canadian agriculture. Now, in the past few years there has not been any evidence of the number of tractors decreasing. As a matter of fact, from 1951 to 1956 there was quite a sharp increase in the number of tractors used in Canadian agriculture and, as a matter of fact, a sharper increase in province like Ontario and Quebec than in the prairie provinces. The point is that although the number of farms has been reducing, say particularly since 1931, the number of tractors used on farms has been increasing and, in order to maintain the stock of tractors you have to increase the purchases of tractors.

Mr. HORNER (*Acadia*): I agree, but my first question was something to this effect: with the fewer number of farms would there not be a tendency to lower the number of purchases of new tractors? I am not saying that the total number of tractors in Saskatchewan would decrease. I am just saying that a drop in the purchase of tractors would come about slowly. Do you agree with that?

Mr. WENAAS: Yes.

Mr. HORNER (*Acadia*): On page 16 of the brief you make assertions with regard to the age of tractors, and other matters. We have had representatives of farm machine companies before this committee and they have verified what I, as a farmer, would frankly admit, that tractors and machinery generally have been improved to some extent, though perhaps not as much as farmers would like. Now, is there not a tendency to have fewer purchases of machines as the machines are improved in quality and durability? Do you agree with that assumption?

Mr. WENAAS: It seems to me the average power of tractors purchased today is considerably higher than the average horsepower of tractors purchased at the end of the war. This would have the effect of reducing the total number of tractors required.

Mr. HORNER (*Acadia*): I was not thinking particularly of power tractors. I was thinking of sealed bearings and combines. A person who bought a sealed bearing combine in 1954, today has a combine which is still in relatively good shape and which will continue in operation for many years. Then there were other changes like the three point hitch, which Ferguson came out with in the 40's, and these tractors are relatively convenient to use, even today. I know a number of farmers who use them, and I submit that these are factors which would have a tendency to slow down the number of new purchases made by the farmers. Do you agree with that?

Mr. WENAAS: I think this must be a factor somewhere, but it is hard to realize how much of a factor it is.

Mr. HORNER (*Acadia*): There is another factor which has a bearing on new purchases and that is with regard to the farmer's own ability, and the other equipment which he has. A few years ago farmers did not have the know-how or technical knowledge to repair machines and keep them in good shape. In this regard I am thinking particularly of the increase in the number of electric welders and acetylene welders used on farms today. There were very few electric welders used on farms in 1950, and there were hardly any acetylene welders. When machines broke down the farmers had to take them in and get them repaired, and usually the repair bills were costly. But today, with one farmer in three having an electric welder, and some having acetylene welders, and with the number of farmers who are taking courses in Saskat-

chewan schools and in technical schools in Alberta, they know how to repair tractors, they know how to weld and repair the various component parts of combines and disc harrows, and all this would have a tendency to slow up the replacement of the machinery in use. Do you agree with that?

Mr. WENAAS: Over a period of ten or fifteen years that would have some effect, but the alarming part of the situation that we have attempted to point out here is the very drastic increase in the average age of the two implements which we studied in the period since 1956 which, while it might be offset to a small extent by some of these factors to which you have referred, obviously they of themselves would not begin to explain the situation. The situation is basically that since 1954—even though we looked at 1956 because that year provides the last recorded census of trucks and combines—the farmers in Saskatchewan and in the prairie provinces generally have not been buying enough machines to maintain the quality, the stock, the good condition and the workability of the machines.

Mr. HORNER (*Acadia*): In other words, you do not believe those figures published in the economic review that, dollarwise, in 1959 Saskatchewan farmers spent \$50 million, one quarter of the total amount for the whole of Canada, on new implements, and that in 1960 Saskatchewan spent \$54 million, again practically one quarter of all the new implements purchased in Canada? To some extent would this not indicate that as of recent years, and I am talking about 1959 and 1960, they are starting to replace and replenish farm machinery stocks in Saskatchewan?

Mr. WENAAS: I quite accept those figures, but the point is that those purchases, high though they might appear to be, are not sufficiently high to maintain the quality and the stocks of farm implements and equipment.

Mr. HORNER (*Acadia*): I am not saying they are maintaining them. All I am saying is that they are starting to replace machinery in Saskatchewan.

Mr. WENAAS: Yes, they are replacing a part of the equipment that would ordinarily be retired, but it would appear from this study that in the province, and in the prairie provinces generally, there is equipment that should be retired, but it is still being used because of the situation.

Mr. HORNER (*Acadia*): I had almost finished asking questions but your statement that there is equipment which should be retired compels me to continue. I am a farmer. I have some machines which are pretty old, some machines which are pretty new, and some which may be too new. Is it not up to the farmer himself to judge whether a machine should be retired? How could we say by looking at a set of statistics that some of the machinery should be retired? I may tell you that I have a neighbour who has a tractor which is 14 years old, and no one in God's own world could convince him that that tractor should be retired.

Mr. WENAAS: I am just basing that on the depreciation rates applied both by the federal department of agriculture and by D.B.S.

Mr. DANFORTH: Mr. Chairman, my first question is based on the following statement on page 4:

Thus, although any farm machinery price reductions would have important benefits, they would not be fully realized unless fundamental marketing adjustments and pricing policies are adopted by the federal government to enable agriculture to obtain a fair share of the national income.

I am very much impressed with the analysis that the Saskatchewan government has made of this whole farm agricultural problem. I would like to ask three questions based on this as preliminary. Since it was indicated that freight

rates and distribution costs, especially because of Saskatchewan's geographic position, had a great bearing on the price of farm machinery, and since it has been asked that the federal government take some steps, what steps has the Saskatchewan government contemplated in the manner of grants to offset the high cost of freight or grants to farmers to offset the high cost of distribution, or loans to farmers to enable them to take care of the high cost of farm machinery? In other words is the Saskatchewan government, other than through its testing station, doing anything to alleviate the so-called narrowing of the price spread for the farmer?

Mr. NOLLET: The hon. member ought to know that there are jurisdictional responsibilities under our constitution, and therefore limitations. I hope he is not suggesting that the provincial government could correct any defect in the economy which is related to national fiscal policy.

Mr. DANFORTH: May I point out that in Ontario when we have a specific agricultural area which is in trouble the provincial government does take steps to alleviate this trouble. I am asking you whether the Saskatchewan government is doing anything, or are you just asking that the federal government do something. Is the Saskatchewan government taking any action?

Mr. NOLLET: Yes. We have taken a great deal of action to endeavour to improve the farmers' income in terms of productive efficiency. All of the policies within the department of agriculture—the various subsidies that are made to local governments—are all made in recognition of the fact that the farmer is at an economic disadvantage. In so far as machinery is concerned we have set up this testing organization. Within our field we have endeavoured to do what we could.

Mr. DANFORTH: Is there any direct financial aid given to a Saskatchewan farmer by the Saskatchewan government?

Mr. NOLLET: A good deal of financial aid is available for various projects within the department of agriculture itself in the field of production, such as additional community pastures, fodder, and this sort of thing.

Mr. DANFORTH: At the bottom of page 5 I notice that in your calculations since 1921 you include the price of automobiles. Does that carry through in all your figures here?

Mr. WENAAS: Automobiles and motor trucks are included in the equipment required by a farmer and are included under farm implements.

Mr. DANFORTH: The increased cost of automobiles alone would have a bearing on the increased cost as shown in the brief.

Mr. WENAAS: Yes.

Mr. DANFORTH: On the whole farming operation. Do I take it that your net farm income, based on your calculation here, would be the gross income from which would be taken the total farm operating costs and depreciation to get the net farm income.

Mr. WENAAS: Are you referring to table 7?

Mr. DANFORTH: The table on page 11 where you state "farm machinery operating costs and depreciation charges as percentage of farm cash income". Can I assume that in your calculations the net farm income would be the gross income of the farm from which would be subtracted the total farm operating costs, and depreciation, as set out in your table on page 11.

Mr. WENAAS: Yes. I should indicate that the net farm income would not be the same as the net farm income that has been established by the dominion bureau of statistics, because they adjust their net farm income for changes in inventory—for instance, the eggs that a farmer might eat which he raises on the farm.

Mr. DANFORTH: Am I correct in assuming that would give you your net?

Mr. WENAAS: Yes.

Mr. DANFORTH: In total farm income you include five per cent interest on your investment; you include the wages for your farm operator; you include allowances for family labour. All these things are taken as farm operating costs.

Mr. WENAAS: They are not included in this table at the top of page 11. The table at the top of page 11 is based on D.B.S. material. The department of agriculture in Saskatchewan has conducted a study of farm operating costs, and the results of that study are indicated on page 12, table 8. It is in that study that an allowance of five per cent return on investment is included. That five per cent return on investment is not included in the D.B.S. estimates of farm machinery operating and depreciation charges. Something else which is not included in the D.B.S. estimate is the farm operator's wage allowance and allowance for unpaid family labour. The D.B.S. study is designed to get at, in a sense, the cash position of the farmer, while this study by the department of agriculture is designed to look at the total of the operating cost of farming.

Mr. DANFORTH: Is the table on page 11 taken strictly from D.B.S. figures?

Mr. WENAAS: Yes.

Mr. DANFORTH: As differentiated from table 8?

Mr. WENAAS: Yes.

Mr. MANDZIUK: Supplementary to what was said a moment ago, C.C.I.L. was assisted in its start by your government. I think you, Mr. Nollet, indicated that for financial reasons this co-operative cannot expand. Are you not prepared to give it further financial assistance in order that it could compete with private enterprise or buy out Cockshutt?

Mr. NOLLET: We have a standing offer to them, whenever they want to expand, that the money is there.

Mr. MANDZIUK: It was mentioned that as assistance to farmers you support community pastures. Is that under your own legislation, or are you thinking of the P.F.R.A.

Mr. NOLLET: Both. We have P.F.R.A. pastures.

Mr. MANDZIUK: That is not under your own legislation.

Mr. NOLLET: Under our own legislation we have established provincial and also co-operative pastures.

Mr. MUIR (*Lisgar*): What percentage of your total budget is directed annually to your department of agriculture?

Mr. NOLLET: Around five and a half to six million.

Mr. MUIR (*Lisgar*): I mean percentage-wise.

Mr. NOLLET: Taking the gross, it would be six per cent, and sometimes as high as ten per cent.

Mr. MUIR (*Lisgar*): Is not ten per cent a little high?

Mr. NOLLET: No. For example, we have the emergency assistance and snow bonus they call it out there. Our estimates are up very substantially. It would run around five and a half or six per cent, including capital budget.

Mr. MANDZIUK: How many community pastures do you have established in Saskatchewan, compared to pastures established under federal legislation.

Mr. NOLLET: There are fifty-six P.F.R.A. pastures, thirty provincial pastures, and one hundred and three co-operative pastures and co-operative fodder projects.

Mr. MANDZIUK: Do your rates compare favourably to the rates under the federal pasture scheme?

Mr. NOLLET: Pretty much the same. Our pastures are on land which is taxable. The P.F.R.A. does not pay taxes, but we are hoping they will.

Mr. SLOGAN: On page 3, Mr. Nollet, you make the statement that in 1960 a bushel of wheat will buy only thirty-eight per cent of what it would buy in 1945 in terms of farm machinery. A few minutes ago I was interested to hear you mention productive efficiency. Do you, or do you not, agree that productive efficiency on Canadian farms has increased in fifteen years more than in any other sector of the economy?

Mr. NOLLET: Yes; but not a great economic benefit to the farmer.

Mr. SLOGAN: Do you not agree that because of the advances in technology, fertilizers, seed, and new farm machinery, that the farmer who was producing in 1945 really can produce a great deal more in 1960 than in 1945 in terms of bushels of wheat?

Mr. NOLLET: Yes, he can. His production techniques are better. He has more wheat, but again I say this has not put him in a better economic position correspondingly.

Mr. SLOGAN: At the same time you are taking a bushel of wheat in 1945 and a bushel of wheat in 1960, whereas in terms of productive efficiency that same man could produce between 38 per cent and 50 per cent more wheat.

Mr. NOLLET: Oh no, the best he could possibly do would be on the average of two or three bushels to the acre more.

Mr. SLOGAN: You mentioned it in your own brief. Do you think that this figure of 38 per cent is accurate, taking into consideration that the farmer will be producing more wheat in 1960 than the same farmer in 1945?

Mr. NOLLET: This would not be an offset to this cost. He has improved his machine efficiency and his labour efficiency. He was able to get rid of the hired man, to put it bluntly.

Mr. SLOGAN: But he was also able to get more wheat.

Mr. NOLLET: Not enough more.

Mr. SLOGAN: Mr. Chairman, could I continue at the next meeting?

The VICE-CHAIRMAN: Very well, Mr. Slogan will be first at the meeting at 2.30.

AFTERNOON SITTING

FRIDAY,
May, 19, 1961.

The VICE-CHAIRMAN (*Mr. Smallwood*): Gentlemen, I see we have a quorum. Mr. Slogan has the floor.

Mr. SLOGAN: I want to go back to the statement I was speaking about at the conclusion of the meeting this morning. It was that a bushel of wheat in 1960 will buy only 38 per cent of what it would buy in 1941 in terms of farm machinery. I do not quarrel with that statement, because I think it is quite correct. But later in your brief you go on to say that agriculture has shown the most rapid increase in productivity of any section of the economy. I do not disagree with your original statement, but I think its implications are wrong. Would you agree that if the fact of your productivity were taken into consideration, that this figure of 38 per cent would be quite different?

Mr. NOLLET: It could very well be down a bit, but not too significantly. The point I wanted to make is this: I was thinking that perhaps you were assuming that the per-bushel return in terms of bushels per acre would increase sufficiently to off-set it a great deal. But this would not be true. Modern

mechanization has put pressure on the farmer to increase his land holdings, and to increase the number of acres from which he can produce a crop. This would have some effect. But has had sufficient effect to off-set the low return received by the farmer, and the high prices he has to pay for goods, particularly farm implements.

Mr. COOPER: I do not think it is necessary for the witnesses to rise when they answer questions. Perhaps they would find it more comfortable to remain seated when replying.

Mr. SLOGAN: I wanted to go back to your answer to an earlier question of mine when we were talking about marginal farms, and when you stated that marginal farms were not a problem, but that the big farms were. Do you really believe that marginal farms are not one of the main problems in agriculture today?

Mr. NOLLET: In terms of economics and the things we are talking about here, I would say no, it is not a major problem. Industry as a whole is in trouble. Marginal farms present a problem, that is true; and the effect of the economic squeeze on marginal farms is more drastic in terms of social circumstances than it is upon large farms. Even if the farm is of reasonable size, it is a difficult thing; it is an economic difficulty because of the disparity of the price relationship.

Mr. SLOGAN: Would you not say that the marginal farmer is in great difficulty having regard to farm machinery, because he is not getting the capacity to derive the returns he would like to get?

Mr. NOLLET: That is true. Even though he be a small farmer with good crop land suitable for cultivation, he could help his situation to some extent by the co-operative use of machinery. Some of them have done this. Now, however, there is a tendency towards greater custom work, and some companies think in terms of renting machinery rather than selling it.

Mr. CLANCY: I have four questions based on the brief. This morning we listened to you as you went through the part having to do with machinery, and later you came to the question of plant obsolescence. How do you reconcile the two? Every tractor in Saskatchewan is old, you say. Whose estimate is that statement based upon?

Mr. WENAAS: These estimates of the age of tractors are based first of all on the D.B.S. decennial census, and on the last one, of course, which was in 1956, as far as the count on tractors and combines is concerned. These we applied to the sales of tractors and combines in each year, also as supplied by D.B.S. As a matter of fact, in order to arrive at an estimate of the average age of these tractors and combines, we had to look at the record of sales extending over the past 20 or 25 years.

Mr. CLANCY: Thank you. The next thing is at the back part of your brief where you talk about plant obsolescence. You cannot reconcile the two. If a tractor will last 14 years, you cannot say that the machine was planned to disappear in three years.

Mr. WENAAS: I think the point about plant obsolescence is that it is a point brought up by the manufacturer of the implement, and that it is designed to make the farmer feel that his machine is outmoded, before, in fact, it is.

Mr. CLANCY: Is that an opinion or a fact?

Mr. WENAAS: Well, I would have to refer to Mr. Kyle in so far as any documentation of planned obsolescence is concerned. There is a considerable element of this feature developing in the industry.

Mr. CLANCY: Is that an opinion or a fact? Can you prove it?

Mr. KYLE: I think with respect to the words "planned obsolescence", it is an expression which covers quite a wide range of interpretation. Planned obsolescence, perhaps, may be thought of in terms of the automotive industry.

Mr. CLANCY: I think we all understand what planned obsolescence is. We are all business men or farmers. So would you please answer yes or no? Is it an opinion, or is it a fact?

Mr. KYLE: I suggest, sir, that from your interpretation it would be an opinion, that this is planned obsolescence.

Mr. NOLLET: I think we could say that if a farmer had plenty of money, it would be a fact that he would buy machinery. You know how they are, and how we all are.

Mr. CLANCY: This morning I heard it said that it was estimated. Whose estimations are these?

Mr. WENAAS: In regard to the age of the tractor?

Mr. CLANCY: It was when the minister was reading the introductory part of the brief, he said it is estimated. Whose estimations are they?

Mr. WENAAS: I can be quite specific and clear on the age breakdown of the tractors and combines. These were estimates based on the work by the planning board. However, the basic data is obtained from D.B.S. These were expressed as estimates, because in this field almost any figures you come up with are estimates. But we believe they are quite reliable estimates.

Mr. CLANCY: That is something you would not believe from Massey-Ferguson. We said, come back and produce facts.

Mr. WENAAS: I do not think Massey-Ferguson dealt with this particular point at all. I think the statistical foundation for these estimates of the average of tractors in Saskatchewan and the prairie provinces, and the same study for combines, is pretty sound.

Mr. CLANCY: You do use the D.B.S. figures?

Mr. WENAAS: Yes.

Mr. CLANCY: Every tractor which burns thirty-five gallons of gas burns one gallon of oil.

Mr. WENAAS: No.

Mr. CLANCY: Those are D.B.S. figures.

Mr. WENAAS: At this particular time I am referring to the studies we have made of the average of tractors and combines in existence in the province of Saskatchewan and also in the prairie provinces, and this other estimate about the average amount of oil or gas has no relevance to this at all.

Mr. CLANCY: There is no physical count. It is an estimate.

Mr. WENAAS: There is a physical count every five years, and there has been over the last period of time. At this time we have to make an estimate because, although the census is being held this year it has not been held yet. That is the point.

Mr. CLANCY: In one of the appendices I see an average price of wheat for a certain number of years, but no grade is given. Is that based on No. 1 northern, and where?

Mr. WENAAS: No; it is the average price for all wheat. Accordingly there would be fluctuations, because in different years there is a higher proportion of higher grades of wheat. This is the average price of all.

Mr. NOLLET: Of all grades?

Mr. WENAAS: As a matter of fact, it is the average farm price in Saskatchewan.

Mr. SOUTHAM: One of my basic questions has pretty well been answered. It had to do with the observation about planned obsolescence and is based on the assertion on page 5 where you say:

Industry policies of planned obsolescence are also raising costs.

I was going to ask what evidence you have on this question, because I have asked this question of several witnesses and they have denied there was such a thing as planned obsolescence. I wonder if you have any evidence, or if it is based on your testing in Saskatchewan in connection with this?

Mr. WENAAS: We have produced no evidence in relation to the testing program which would support this contention. This is based on the observation that there are some features built into model changes that appear not to be utilitarian.

Mr. SOUTHAM: I come from a farming area and have heard this assertion. I have put the question to certain witnesses and they have emphatically denied it. I notice you commence with an emphatic statement, and I wanted to co-ordinate the two.

Mr. HORNER (*Acadia*): There is the following statement on page 11 of your brief:

It should be noted that an allowance of a five per cent return on investment was included in the farm business summary's calculation.

Do you say that a five per cent return on investment is a minimum amount a farmer should be expected to take?

Mr. NOLLET: I would think so.

Mr. HORNER (*Acadia*): Would you suggest that five per cent is the minimum that a machine company, or any other business should take as a return on investment?

Mr. NOLLET: That would be a hard question for me to answer. One would think that if it is sauce for the goose it should be sauce for the gander; but there are possibilities that because of their structure aspects probably a higher return would be required.

Mr. HORNER (*Acadia*): For who?

Mr. NOLLET: In the case of the companies. Only a very careful analysis would determine that. I would think, in any man's language, a five per cent return is pretty good.

Mr. KORCHINSKI: My question has been partly answered. I am wondering what is so disturbing about the fact that the average length of a combine has increased from 6.4 to 9. This relates to the industry's opinion on planned obsolescence. Do you believe there is a planned obsolescence, or that the average length of a combine has increased and therefore there is no planned obsolescence.

Mr. WENAAS: I think the member has misunderstood the point that was being made in this brief. We have not suggested that the average life of the combine has increased from 6.4 to 9. What we are stating is that our analysis indicates that the average age of the combines now in use on the farms, including the ones which have just been bought as well as the ones that are on the point of being scrapped, has increased from 6.4 years to 9 years. What we are indicating there is that on the basis of the study the combines in existence in 1956, including the ones that had just been bought, had an average age of 6.4 years, while in 1960, just four years later, the combines in use on the farms—this in the prairie provinces—had an average age of 9 years.

I think, perhaps, that a number of the members have misunderstood the point we were making here. We are not suggesting that this is an indication that the life of a combine is only nine years, but that the average age of tractors now in use is nine years.

Mr. KORCHINSKI: Do you not think that there is another factor involved in this? I can recall that during the war we could not buy a great deal of machinery; however, after the war was over it was a different situation. I purchased my first combine in 1948. We used threshing machines before that time. Therefore, in connection with your statement having to do with 1956, you could not possibly have had an average life of any more than that. These machines presently are being used everywhere and nearly everyone has one of some sort or other. Therefore, the average age should expand, and this will continue up until a certain point. Do you not think that is contributing factor?

Mr. WENAAS: Well, in 1946, according to our analysis, the average age of combines in the prairie provinces was 6.9 years. This is set out at page A-31.

Mr. MANZIUK: How many acres or hours per annum is allotted to the combine which lasts that many years?

Mr. NOLLET: It has nothing to do with the probable life of a machine. This is just saying how old they are at the present time—the average age of them.

Mr. WENAAS: We are just looking at them as though they were people and giving the average age.

Mr. MANDZIUK: Of life expectancy?

Mr. WENAAS: No. You see, the average age of the people here in Canada is such-and-such, but that does not mean they are going to die at that particular age. This is the average age of combines. It was 6.9 in 1946, 5.9 in 1951 when there were increased sales, 6.4 in 1956, and 9.0 in 1960. This has been the pattern.

Mr. KORCHINSKI: Do you not think it is a good thing if machines last longer. In other words, if it costs \$2,000 and I can use it ten years, that comes to \$200 a year. However, if I can only use it for five years, the amount would be double, namely, \$400 a year.

Mr. WENAAS: Perhaps I have not made myself clear.

Mr. KORCHINSKI: No, you have not.

Mr. WENAAS: This does not include how long the combine is expected to last; all this indicates is that there is a higher proportion of old combines now being used in the prairie provinces than was the case five years ago, and we believe that that represents the beginning of a rather unsatisfactory situation because, in five years' time, unless the sales of combines are very much increased, you are going to have a higher proportion of old combines being used.

Mr. KORCHINSKI: I use old machines, and they have been very serviceable; are you advising that we should trade in our machines every year?

Mr. WENAAS: No.

Mr. NOLLET: If you would turn to page 17, I think, as a farmer, you will see it more clearly. Would you look at table 11. In Saskatchewan this shows that at June 1st, 1956, there were 121,000 tractors, and the average sales since 1956 up to the present time has been \$4,484. All we are saying is that due to various factors, principally the disparity in farm income, the farmers have not been replacing machinery, and if this continues it would take 27 years to replace the 125,000 tractors. That is all we are saying.

Mr. KORCHINSKI: Well, I don't believe that. At one time I only had one tractor, but now I have three. I use that one tractor to bring the cows home. However, I do not use that one any more; I have another one. The same tractor will last me twenty years. However, if I used it to haul a load of grain into town, that tractor would be in use more often, and, therefore,

would have a shorter life. That tractor I have today I hope will last me twenty years.

Mr. NOLLET: We are not arguing that. They are getting older, not because of any planned obsolescence, but because the farmers have not been able perhaps to replace them as fast as they ought to. We will say that a tractor or combine ought to operate with reasonably good care for fifteen years, or with really good care, for twenty or twenty-five years. I have seen old binders that have gone for twenty-five years; but, it depends on the treatment they are given.

Mr. KORCHINSKI: I have tractors that I would not want to replace. I will add parts to a tractor because I want to keep it. In other words, there is no planned obsolescence. That tractor will last longer. Is what I am saying not right?

Mr. NOLLET: Well, this expression "planned obsolescence"—

Mr. KORCHINSKI: It is a bad word.

Mr. NOLLET: The only time you could use it would be by way of demonstration. Let us assume that new methods, refinements, soft seats and so on came out, and farmers had a lot of money; then I think the same concept of keeping up with the Joneses would take place, and there might be some premature obsolescence. We must remember, however, that it is not altogether bad, because usually the farmers that will be buying the new machines will be the bigger farmers, and the smaller ones usually have an opportunity to buy a second-hand one.

Mr. KORCHINSKI: Are you suggesting that I am gullible enough that I will buy a new one because it has a cigarette lighter, or some other gadget on it, and has a two-tone paint job?

Mr. NOLLET: No, I am not. All I am saying is that when we talk about rationalization of the industry, it is this: These kinds of gimmicks to induce sales should not be used in the farming industry, and in my opinion the successful machinery industry of the future will be the one that sells a good, durable product that is well suited for the work intended, and will provide good service. That is all I am saying.

Mr. CLANCY: In connection with this subject of age, to me, your figures are rather misleading because you started off in a year when, in certain areas of Saskatchewan, mechanization was just started. I think you are all aware of the fact that starting in 1947 and up until 1954 there was a great deal of mechanization in the northeastern part of the province. Before that, they used horse-drawn vehicles. As a result of this, there was an increase in the sales of tractors. I do not think that the figures you have given us mean anything. They do not reflect the real problem.

Mr. WENAAS: This is an attempt to measure the effect of the reduced farm machinery sales.

We made three approaches: one of them was referred to by Mr. Nollet a short time ago in which he related the average annual sales of 1956 to the stock of tractors on the farm in 1956, and we obtained from that the number of years that it would take to replace tractors if sales did not increase.

Mr. CLANCY: In other words, your argument is that this is from the sales point of view and not from the farmer's point of view?

Mr. WENAAS: It is definitely from the farmer's point of view. It seems to us to be a matter of concern to the farmer if he is unable to purchase sufficient farm machinery in order to keep his capital investment in good order. We have taken the approach that any business should be concerned if it finds it is not replacing its capital equipment as fast as it is being depreciated. That

has been indicated by the D.B.S. figures we referred to in table 10, where it was indicated that since 1954 there has been a depreciation in the value of farm implements in Saskatchewan of \$93 million, and in all the prairie provinces of \$166 million.

Mr. CLANCY: There are two types of depreciation, one for income tax purposes and one which is realistic.

Mr. HORNER (*Acadia*): Oh, now—

Mr. WENAAS: This is the depreciation rate that has been applied by D.B.S., and it is based upon farm surveys. It is possible there is some error in it but the general direction of the trend is, I think, quite clear.

Mr. CLANCY: What are you trying to prove by the emphasis on aging machinery?

Mr. WENAAS: In looking at the average age of tractors and combines, which are the two largest single items in the farmer's budget for farm machines, we sought to ascertain the effect of these reduced purchases of farm machinery. Although we would not have been alarmed if we had seen a moderate increase in the age of tractors and combines in that comparatively short period of time and, as we indicated this morning it may be possible to explain some of that on the basis of improved technology, it is however a matter of concern when in just four years the average age of tractors on the farms in Saskatchewan has increased by about two years.

Mr. CLANCY: In other words, you are trying to prove the amount of the machinery bought is the gauge of the farmer's prosperity?

Mr. WENAAS: Yes, and I think that is quite clear.

The CHAIRMAN: We have now spent one hour on section one, and I notice there are seven sections in the brief. Are there any further questions on section one?

Mr. FORBES: I have one on section one.

The CHAIRMAN: If we are going to continue on section one, then Mr. Danforth is next.

Mr. DANFORTH: My questions have a bearing on section one and on a continuation of the brief. Mr. Minister, in looking at this brief I am under the impression that by the compilation of these figures you are attempting to present a picture of what is happening to farm prices and machinery prices. Am I correct in that assumption?

Mr. NOLLET: Yes, and their effect on the farm machinery set-up.

Mr. DANFORTH: I am also under the impression that the D.B.S. and the other sources available to the department have tried to make these comparisons as correct as possible. That is a fair assumption, is it not?

Mr. NOLLET: Yes.

Mr. DANFORTH: And all you have done is to change your values to be consistent with the rise in price of farm costs due to mismanagement, which would have quite a bearing on the picture you represent. What I mean by this is that tremendously large tractors are bought, as is done in Saskatchewan—and I may add I was out there and saw the farmers pay anything from \$6,000 to \$8,000 for a tractor, which is not uncommon today—when perhaps a \$4,000 tractor would be sufficient. That is one kind of mismanagement. When that happens, you are overbuying in the potential of the machinery, and its depreciation costs and investment costs are going to rise in proportion.

I feel it is unfortunate that you included the farm automobile in this machinery investigation because of the fact that automobiles are not always classified as farm machinery, especially where there is a truck as well on a farm. Has anything been done to discount the actual cost where there would

be two cars and a truck on a farm? In other words, how much credence can we put on these total farm costs because of the fact that these are costs which are inherent in the picture as presented?

Mr. NOLLET: I think the best gauge for judging that would be in the section we have on farm management survey, which involved the better farmers, the farmers with better ability.

If you look at the bottom of page 12 I think that pretty well confirms the other figures which were given, and I think it will pretty well answer your question. Of course we must agree there is a certain amount of mismanagement and poor utilization of machinery, as you say.

Mr. DANFORTH: That would increase the cost?

Mr. NOLLET: I do not think this factor is as significant in Saskatchewan as elsewhere, but probably there is a great degree in Saskatchewan because the size of farm units has been going up tremendously. This means that farmers are very conscious of the need for acquiring increased land resources because of their increased capital investment in machinery. That has applied in the past, although there are some who are over capitalized in so far as machinery is concerned.

This farm management and business summary, made by our farm management people, takes in the better class of farmers and the figures seem to confirm pretty much what has been our contention in the brief.

Mr. FORBES: Mr. Chairman, on section one, page 18 of the brief, it is stated:

We have not attempted to go into the question of the factors that enter into the costs of the materials used in manufacturing since this would require an analysis of the whole economy.

Now, the matter of costs is the subject of this whole inquiry, and a lot of the material you are supplying is irrelevant to the facts we want to bring out.

We want to know in dollars and cents how much labour goes into a tractor or whatever you are building, how much, in dollars and cents, applies to material, what is the mark-up of the manufacturer. Our opinion at the beginning was that the manufacturer's mark-up was too great, that there was something in the form of collusion between the various companies arriving at prices. Those are the things we want to know—why did you not carry on your inquiry into the effect of costs.

Mr. NOLLET: We would have liked to, but to get it accurately and in fairness and justice to the companies and all concerned, this information you obtain ought to be very accurate and ought to be obtained by some competent accounting firm, unless you want to have for granted the material that is given to you by the manufacturers themselves. When we had our investigations in Saskatchewan in 1952 we were unable to get that information from the companies, and at that time, I believe, by a resolution of the legislature, we asked the federal government to continue this inquiry, as you are doing now. It is our hope that this committee will get very accurate information. We want to know, all of us, what are the component costs of manufacturing. I do not know; perhaps steel has gone up, perhaps there is justification for this. These are the questions we need answers to and we are hopeful that this committee might find them. We, as a province, cannot require companies to come to us and open their books. We have that power. You can make all these inquiries, and we are hopeful you will do it and find out what the facts really are.

Mr. FORBES: Is it your opinion that the companies actually know what it costs to produce individual machines?

Mr. NOLLET: I think they do.

Mr. HORNER (*Acadia*): I have a supplementary point. Did I understand you right, Mr. Minister, with regard to the statement you made, did the Saskatchewan government after their inquiry request the federal government to make an inquiry into agricultural prices of machinery such as is going on right now?

Mr. NOLLET: We did. You will have a copy of this inquiry of ours in which one of the first recommendations was that the federal government be asked immediately to take appropriate and effective action or alternatively to increase prices of farm products in order to modify the effects of high machinery costs. If I remember correctly, at the same session of the legislature we passed a resolution asking the federal government to continue this inquiry.

Mr. MANDZIUK: What year was that?

Mr. NOLLET: 1952.

Mr. MANDZIUK: Have you made any other requests since 1952 for such an inquiry?

Mr. NOLLET: I could not say offhand. The legislature may have subsequently, but I am pretty sure they did. This report was submitted to the legislature and it was followed up by a resolution to the federal government. You can check that.

Mr. KORCHINSKI: Mr. Nollet suggested here that perhaps the price of steel has gone up. Would you go so far as to say that the increase in labour has contributed towards the increase in the price of machinery?

Mr. NOLLET: You will have labour people presenting a brief to you, and I think they will submit evidence to say that the labour factor of cost has diminished—but I am no authority on this.

Mr. KORCHINSKI: I would like you, sir, to give me your opinion whether labour has contributed towards the cost of machinery, the increase in the cost of labour?

Mr. NOLLET: I do not think labour costs have been as significant as other costs.

Mr. KORCHINSKI: But they have contributed towards the cost?

Mr. FORGIE: What other costs, what else has contributed?

Mr. NOLLET: I would say probably material costs and the cost of re-equipping and retooling of factories in terms of better machines, and automation. I think it is pretty well accepted that in all industries, including agriculture, the cost of labour has gone down. It is the mechanization phase that has added to the cost. These factors may be legitimate, but they are things we accept.

Mr. KORCHINSKI: One more question: would you not say then that in the cost of material, labour is a factor?

Mr. NOLLET: Certainly, it is a factor all down the line.

Mr. FORGIE: Mr. Chairman, I sent out 1,800 letters to the farmers and I got answers—about 162 of them—and the prime factor in increased cost of machinery, according to the farmer, is the cost of labour, and second, the cost of steel.

Mr. NOLLET: It could be. None of us know, but to get an accurate picture, the only thing to do is see the books of the companies.

Mr. FORGIE: Why is it that in this brief it is not shown; why is it not admitted in your brief; why do you not know that?

Mr. NOLLET: We do not know. If the companies had given us access to this information in 1952 we would have known. At that time we did engage an accounting firm to get an accurate picture, and I think this should be avail-

able to the public. We ought to know the facts. I am not interested in fiction. All I have been doing is expressing an opinion in this regard. I think all of us want to know the facts.

Mr. FANE: I do not know which section my question comes under, but I had the impression all through this brief that the recommendation of the Saskatchewan government is that we have nationalization of the farm machinery business. Now, I want to know how much—

The VICE CHAIRMAN (Mr. Smallwood): Your question will come under section 2.

Mr. HORNER (Acadia): We are finished with section 1.

The VICE CHAIRMAN (Mr. Smallwood): Are there further questions on section 1?

Mr. THOMPSON: I have a question on page 24.

Mr. HORNER (Acadia): That is in section 2.

Mr. BOULANGER (Interpretation): Here is the question I would like to put. We have here the reports from machinery companies. International Harvester reports net profits of 3 per cent in 1960; Massey-Ferguson from 1954 to 1960 reports a net profit of 2.3 per cent. Do you find these net profits exaggerated?

Mr. WENAAS: I do not know how those were calculated in the case of International Harvester because I have not seen them, but in the case of Massey-Ferguson, those profits have been calculated in relation to sales. I would suggest that the more appropriate way of calculating the rate of profit is by relating the profit to the amount of capital investment required. You get quite a different picture then.

Mr. BOULANGER (Interpretation): But if you calculate profit on investments, we have here for Cockshutts, from 1947 to 1960, an after tax profit of 6.1 per cent.

Mr. WENAAS: That is referred to on page 25.

Mr. BOULANGER: Do you think it is too much?

Mr. WENAAS: I would not say, in regard to Cockshutt farm equipment specifically, that over the whole period this exceeds an adequate amount. I do, however, refer you to Massey-Ferguson. Over the whole period in spite of the reduced farm machinery sales since 1954 Massey-Ferguson has showed a return of 11.1 per cent on stockholders' investment after taxation.

Mr. BOULANGER: 7.2 per cent after taxation.

Mr. WENAAS: 19.6 per cent before taxation, on page 25, paragraph 2. 11.1 per cent after taxation.

Mr. BOULANGER (Interpretation): How do you think the price of agricultural machinery could be brought down through nationalization of the industry?

Mr. WENAAS: I think Mr. Nollet answered that question this morning. I would not really care to go into that in detail.

Mr. BOULANGER (Interpretation): In point of fact we import 82 per cent of agricultural machinery used in this country. Do you feel that even if nationalization were possible this would have any effect on the bringing down of prices?

Mr. NOLLET: I think I answered that this morning. I think it would have some effect. I think I made this point clear. We are not suggesting nationalization, not because of any perversity of mind, or for any particular reason. We are suggesting to you that after a very careful analysis and studies of the position here, there are some regions you may look to to find a solution—nationalization, cooperative ownership or bringing about some rationalization within the industry without any of those things occurring—if, in your wisdom,

you think this can be done after you have carefully studied the manufacturing costs and distribution costs of farm machinery. These are possibilities, and you may have to turn objectively to the possibility of nationalization. You may have to if, in your opinion, this will bring about the results, when you look at it seriously.

Mr. BOULANGER (*Interpretation*): Some of these arguments appear to me to be somewhat illogical. On page 25 you note that if the sales were higher profits would be still adequate, whereas on page 19 you point to the fact that profits are already excessive. How do you reconcile those two statements?

Mr. WENAAS: The answer to that is that we are suggesting here that the reason for the reduction in the profits of the farm machinery companies since 1954 is that their sales have gone down and their average cost of manufacture has accordingly gone up, and as a result even though they have maintained their prices at a higher level and have increased them, their profits per farm machine have gone down. What we are suggesting on page 25 is that during the early post-war period the companies were able to realize very high profits on the basis of large sales, and they could very well have reduced farm machinery prices in that period. What we are suggesting further is that now, if farm machinery sales were higher, if farm income were such as to maintain farm machinery sales at a higher level, then the farm machinery companies would be realizing the same level of profits that they did in the early post-war period and accordingly a very considerable reduction in farm machinery prices would be justified.

Mr. BOULANGER (*Interpretation*): So that the real crux of the problem would be a reduction in agricultural prices.

Mr. WENAAS: Yes, and it can also be maintained as it was before a number of commissions, both in the United States and Canada, that if farm incomes were at such a level as to sustain a high rate of farm machinery sales, and accordingly a higher rate of farm machinery production, the cost of farm machinery thereby would be reduced because of larger production, and this would enable reductions in farm machinery prices. Therefore, we would suggest there is a relationship between a high level of farm income and the question of producing farm machinery at the most economical price.

Mr. BOULANGER (*Interpretation*): You state on page 19 that the farm implement industry is dominated by a few companies. Do you have any evidence to adduce in this connection?

Mr. HORNER (*Acadia*): What firms are you referring to?

Mr. WENAAS: As far as Canada is concerned we are referring to Massey-Ferguson, International Harvester and John Deere. I think those would be the principal ones. We have the D.B.S. report on the farm implement industry prepared in 1958 in which it is indicated that five establishments—now, two or three of these establishments are owned by the same company—produced 84 per cent by value of factory shipments of farm implements in Canada. When you have those few firms producing that large share of the production, then it is fair to say that the industry is dominated by a few firms.

Mr. BOULANGER (*Interpretation*): Do you feel that if we were to nationalize industry, that is to make your industry subsidized by the state, that this would have any effect on our exports, because as it happens, we export 76 per cent of our production?

Mr. WENAAS: In answer to that, I would just refer you to the fairly recent announcement that Polymer has recently established a plant in France. Polymer is a crown corporation, and we do not see that there would be any necessary difficulties arising in the export trade as a result of a change of ownership of the Canadian farm machinery industry.

Mr. BOULANGER: It is not the same thing at all.

The CHAIRMAN: Polymer is not a farm machinery company.

Mr. NOLLET: We are to look at this from the point of view that you have these large companies, and that it would not necessarily be bad. It is only bad when these companies dominate the industry and extract excessive profits. They probably make substantial savings. That is the trend, largely. And if there is a possibility that these large companies can make substantial savings in production and distribution, then they ought to pass these savings on to the farmer and not take more profit themselves. This is the proposal we make. And if they do not do that, then I suggest you should regulate them and have co-operative ownership; even though you met them in terms of crown corporations. This is the point. It is the benefit of these reduced manufacturing and distribution costs as passed on to the farmer, so that the organization does not take too much. That is the point.

Mr. BOULANGER (*Interpretation*): If there was a deficit in the company's accounts, do you feel that the buyer should have to share in that deficit?

Mr. NOLLET: I think every company ought to carry itself, whether it be a farm machinery company, or whatever it is.

Mr. MUIR (*Lisgar*): When I asked Mr. Nollet this morning in the light of the experience of the Saskatchewan government in manufacturing, and how they could justify the suggestion in their brief that the federal government should enter into the field of manufacturing and distribution of farm machinery, the answer I got was that he gave me as an illustration the Saskatchewan hydro. It is generally an accepted fact throughout Canada that public utilities render a general service to the general public, and they can be operated at a profit, because essentially, of course, they are a government monopoly. That is true. My question, however, was directed more towards the manufacturing and processing phase, since that is the type of thing we are investigating now; and as an illustration I would ask you to give me some examples out of your experience. You had a tannery, and a box factory, and I think there were some others. Have you any manufacturing and processing plants that are actually operating at a profit under the Saskatchewan government?

Mr. NOLLET: Let us not say at a profit in terms of what we are talking about, namely, 14 per cent, and that sort of thing. It is true that the sodium sulphate is operating with good service; and it is much the same with the brick plant. These were industries which never existed in Saskatchewan before. These industries were not there. All of us in that province are very conscious of the need to diversify our industry. That was the reason behind the establishment of some of these enterprises. The tannery is a good example; shoes are in a very highly competitive field. Sodium sulphate, bricks, and timber—these have turned out very well. And the power corporation which is a common thing among public utilities in the province, has proved successful. The point is this, that even with a public utility I do not think it would be justified in taking an excessive profit from the users of that service, or of those goods. It would not be fair to the source of revenue, although you may justify taking a reasonable amount into the public treasury, if it is a natural resource, that you are using. I tried to make the point a moment ago that any organization ought to stand on its own feet and that the price that it charges for its goods and services ought to be sufficient to permit the organization to do that.

Mr. MUIR (*Lisgar*): Would you think that under our free-enterprise system that companies which are competing for business must compete price-wise and quality-wise?

Mr. NOLLET: The driving motive is profit. That is the driving motive. And in a conflict to survive, you must abide by these rules. An illustration of that is where you have large companies in relation to small ones, which are in a position to make excessive profits at the expense of a small segment of the economy. In this particular case, it is agriculture. That is the essential thing. If there is some way we can help the agricultural industry and by making available to it its instruments of production at a reasonable price, I think you ought to take a serious look at such a possibility. I have tried to make the point this morning, that as governments we do a lot of exceptional things for agriculture, recognizing that it is an unprotected industry. These people cannot buy; they do not have the purchasing strength to buy collectively even, and they have little control over the prices of the things they have to sell or the things they have to buy. So for that reason governments have done a lot of things on behalf of agriculture, not only in the field of improved production techniques, but also in many other fields such as your bonuses here and there and all over the place, knowing that it is desirable to help this industry particularly when it has become completely mechanized and the costs are set. Machinery costs are a big part of farm costs. But with mechanization there came a demand for better services, as you all know. So today the farmer has to have money in his pocket to pay for his gas, oil, his electrical bills, and for his education and health, and so on. That is why governments are concerned. I do hope the committee will look objectively on some of these proposals. They are not cockeyed. They are not crank proposals, as you are probably trying to suggest, or socialistic fancy, probably.

Mr. MUIR (*Lisgar*): That is what we are trying to find out.

Mr. NOLLET: We should seriously look at them, and if the companies can exercise some control, even though they are big, they can reduce the cost of manufacture and distribution, and that is fine. But I do not think we can for long go along with other industries riding on the backs of agriculture. It just will not work in modern society.

Mr. HORNER (*Acadia*): Do you include labour unions in that too?

Mr. NOLLET: Surely.

Mr. MUIR (*Lisgar*): At Massey-Ferguson last year, I believe they did more business, I think they said, than they had ever done in their history. I think that is right. Do you not think that the fact that such a big proportion of their machines were sold for export would not help the plant to operate more efficiently, and thereby assist the Canadian consumer?

Mr. NOLLET: I think it would depend.

Mr. MUIR (*Lisgar*): As well as to provide jobs for Canadian people?

Mr. NOLLET: That is right, surely.

Mr. FANE: Throughout this brief nationalization of the farm machinery industry is more or less suggested or advocated. I would like to ask how exhaustive was the inquiry made in regard to how this is working out in other countries? How many other countries have nationalization of their farm machinery, or of any other industries like that? I would just like to find out what kind of inquiry was made into that question. I shall ask the rest of my question after you tell me that.

Mr. NOLLET: I am not aware of any country—any of the western countries—where there is any large scale government enterprise in the manufacture of farm machinery. I do know that where cooperative efforts have been made, small though they are, they have achieved some substantial savings.

Mr. FANE: Then Russia is the only country that has it?

Mr. NOLLET: I do not know anything about their situation, how they operate or anything.

Mr. FANE: I have a membership in cooperative stores. I find that buying groceries in cooperative stores is not one cent cheaper and is usually a little more expensive than buying through privately owned stores.

Mr. NOLLET: That is open to question. The one good thing, however, about the cooperative situation is that if there is any profit made, or any surplus, it is spread among the patrons. This does good in our modern society. Spreading money about is like spreading fertilizer; it should be spread around widely and thinly in order to do the most good.

Mr. FANE: I just want to compare two railways; one is nationally owned and the other is not nationally owned. The C.P.R. that is privately owned runs at a profit. The one that is nationally owned receives an \$80 million subsidy to keep it in the picture. Would that same thing happen to the farm machinery business if it was run as a national organization?

Mr. NOLLET: You might be in trouble if you took it over on the same basis the government took over the Canadian National. It was pretty well defunct. If they had squeezed all the water out of it before they took it over, they would not have had the heavy liability. However, I do not think this makes any difference in the operation, production-wise, of an industry whether it is publicly or privately owned. Both of them endeavour to achieve the greatest efficiency of production. There are expert people available. This depends on management.

Mr. FANE: Theoretically it should be perfect, but in life it does not work out worth a darn.

Mr. NOLLET: In the case of the public utilities in Saskatchewan, I know there is very careful scrutiny by members of the legislature. Private companies do not have that; they can tell us to go to hell and do not make available to us their records. I think they should. We and the public ought to know the facts.

Mr. THOMPSON: If it were possible to cut back prices by all the means mentioned in the brief—by cutting back on profits, by standardization and rationalization, and by cutting back on transport cost, and so on—do you still think you could keep the price of farm machinery from rising?

Mr. NOLLET: No. If inflationary trends continued, quite naturally the prices would go up.

Mr. THOMPSON: What do you mean by inflationary trends?

Mr. NOLLET: If the basic price of steel, for example, goes up it would have an effect on the farm machinery industry.

Mr. THOMPSON: How about labour? Is that a factor as well?

Mr. NOLLET: It could be a factor.

Mr. THOMPSON: And also a factor in the cost of steel as well.

Mr. NOLLET: I like to be objective. Let us not try to put all the blame on labour. All these are cost factors, but we need to look at the whole field.

Mr. THOMPSON: Is not labour a factor in all these things—transportation, steel and everything else? Labour is a factor, and if you cannot keep the cost of labour at a constant figure you cannot keep the prices at a constant figure.

Mr. NOLLET: That is true. We must remember that we all are caught in the cost price squeeze. If costs go up of goods and services you get an adverse reaction from labour. Their membership immediately goes to their leader and says "we want more money because our rent, food, the price of our cars and TV and everything else has gone up." The sad part is we are always in conflict. We will have to find some answer some place.

Mr. THOMPSON: That is the point. What is the answer you would advocate? How do you reconcile the notion of labour and industry so far as farm machinery prices are concerned.

Mr. NOLLET: We are getting into a broad field. In general terms I think a farmer has always been said to be dependent on the general prosperity of the economy. Hundreds, thousands or millions of people eat. If these millions have the money they should be able to buy food at a price that will give the farmer a profit. Similarly, I think the labour people will argue that if we are going to have a market for the product of our labour, agriculture should be prosperous. In the post-war period the reverse has been the case. Agriculture has been in a sort of a depression and far behind, as everyone knows, while the industrial sector, so far as labour people are concerned because of their strong organization and immediate bargaining powers, has been able to get increases in wages and salaries. The farmer did not have that bargaining power and he was caught. I do not think that we as farmers can blame labour altogether for that situation. Let us assume that wages and salaries had not gone up and goods and commodities had; I think probably we would have been in a depression.

What I am objecting to is the way we go about these adjustments. We get into labour dispute, strikes and this sort of thing. I think that all of us will have to acquire a greater sense of responsibility for the different occupational groups. This is the way I like to face problems, whether it be the farm problem or any other. I do not want to see any discrimination against any organization no matter what kind of service it provides or on what basis it provides it, so long as it does not make an excessive profit. My first complaint about agriculture is that the farmers have not had the income to keep their plant in a good state of operation. Every one of you gentlemen sitting here knows—and if you do not Mr. Cadieu could tell you—that if you are a contractor out building roads and do not keep your machinery up to date and in good working order you are soon out of business.

Mr. SLOGAN: I would like to quote from the Massey-Ferguson brief, section E, page 9 where it says:

The price of rolling-mill products has increased by fifty-six per cent since 1949, while the price of iron has increased by forty-six per cent. This compares with the seventy-three per cent increase in average hourly earnings over the same period.

Would you not agree that perhaps labour is one of the main factors in the increase in the price of farm machinery?

Mr. NOLLET: Yes; but I think you could say how many men they employ now as compared to another period. My understanding is that in the last few years there have been less and less men employed in farm machinery and automobile factories. This is your and my problem. These people go on the unemployment lists. If they do not get a job producing something they get a job in the service trades such as running a filling station or something like that.

Mr. SLOGAN: In section B of the Massey-Ferguson brief at page 11 they show where from 1954 to 1960 their net income as a percentage of their sales dollar was 2.3 per cent. This is an outfit that is exporting 85 per cent of its machinery. Do you think a government-owned operation which should not be in the export field, but more or less is trying to supply domestic users alone, could compete when an efficient organization like Massey-Ferguson which is working on such a narrow margin of profit?

My second question is this: Do you think, if the government took over, that it could substantially reduce the price of farm machinery when they are now working on such a narrow margin of profit?

Mr. WENAAS: Again, as indicated in relation to an earlier question, this profit margin is calculated in relation to sales while, if you calculate profit for Massey-Ferguson for the same period in relation to the investment, it comes to 11.1 per cent after taxation. I think that is a point worth bearing in mind.

In relation to your first question, it is quite conceivable that a publicly-owned farm machinery industry could operate in the total North American market. That should not be precluded at all. I think it would be wrong to lay down the condition that such an industry could not operate outside the Canadian market, because, certainly Massey-Ferguson is an integrated operation, and you could not expect to dispose of Massey-Ferguson's subsidiaries in other countries to private interests and expect that you are going to have the same type of operation in Canada. So, I would say, in answer to your question, that you could not separate, really, the one from the other without quite a major readjustment in the structure of the industry.

Mr. SLOGAN: Would you object if the Government of the United States came into Canada and took over one of the American subsidiaries in Canada as a government-owned operation, and competed with privately-owned corporations in Canada.

Mr. WENAAS: I can only answer that question by indicating that apparently France has not objected to a Canadian publicly owned industry being established in France. I am referring to Polymer Corporation, in this case. I can only say, further, that as far as the ownership of an American subsidiary of a Canadian company is concerned, that probably it would not be of any particular concern to the United States government whether this subsidiary was privately owned by one group or publicly owned. It really could not be cooperatively owned, because that would involve a very substantial change in the principle of public ownership.

I think that would be my answer to that question.

Mr. SLOGAN: I would like to ask, also—

The CHAIRMAN: Mr. Slogan, I was giving you just one supplementary to a question previously asked.

Mr. SLOGAN: Well, I think I have been on the list three times.

The CHAIRMAN: And you also have spoken three times. My purpose in doing this is to give each member an opportunity to ask some questions.

Mr. SLOGAN: Will you put me on the list again?

The CHAIRMAN: Yes.

Mr. Horner, you are next.

Mr. HORNER (*Acadia*): Mr. Chairman, my question deals with page 25, in regard to profit.

Mr. Nollet has said that he does not mind profits, but that he thinks excessive profits should be passed on to customers or consumers.

At page 25 you deal with company's profits. Now, in this study we have taken approximately the last ten years—some industries and some manufacturing companies have taken twelve years—in comparing their profit ratios, price ratios, and cost analyses. The thing that bothers me is that we are well aware of what the profits were. During the period 1950 to 1954, Massey-Ferguson pointed this out quite clearly in their own briefs, and it has been pointed out in the briefs of other companies. The thing that alarms me, in looking at a graph at page 52, and a table by D.B.S., is that the prices of farm machinery rose above general wholesale price levels sharply; it started in 1955 and moved up sharply. In fact, in taking the period that you took, from 1947 to 1960, machinery prices doubled during that time. In the last five years they went up 50 per cent. Here is my question: Would it not be proper to assume, to some

extent at least, that in the case of a company which was making large profits, the prices would have a tendency to be higher, but in the case of a company which was making a smaller profit, or reduced its profits sharply, the prices should go down on that particular machine?

Mr. NOLLET: Yes.

Mr. HORNER (*Acadia*): Well, that has not happened. Massey-Ferguson's profits, as well as others, have come down in the last five years. What is the reason for the reverse? If profits is the enemy, then prices should have come down rather than go up. We tend to assume that if profits did go up, then this would be the culprit. However, it does not appear to be, in this analysis.

Mr. WENAAS: Yes. As had been indicated a little earlier, the factor in the reduced profit levels of the industry since 1954, even though prices of farm machinery have gone up, is that they have reduced sales and reduced production.

Mr. HORNER (*Acadia*): I would like to deal with that. I am looking at International's annual report. Their sales in Canada alone have gone up steadily since 1951, in dollar value, although I realize this is not a constant dollar value; however, I would say their production must have remained relatively level. The same is true of Massey-Ferguson; their sales have gone up from \$200 million in 1950 to nearly \$495 million in 1960. So, they have had a continued growth in sales. Perhaps Massey-Ferguson has not in Canada had this growth, but International has, in Canada alone. I have the charts right here to prove it.

Mr. WENAAS: The point is, however, that in Canada the sales of machinery have declined, as you recognize, since 1954, and the lower levels of production than might have been justified under circumstances of higher sales have resulted in higher costs of manufacturing.

Mr. HORNER (*Acadia*): This is the very point. We had information before us from the Federation of Dealers, and they gave us tables and graphs, one of which I have before me now. It indicates that sales of tractors—and they are the main issue; and here is a graph on combines, and they are two of the biggest component purchasers of farm implements—have remained relatively constant since 1954. This is in Canada alone.

Mr. WENAAS: How about before 1954? They declined from 1953 to 1954.

Mr. HORNER (*Acadia*): I will accept that, but why has the price increased 50 per cent from 1955 on? This is not because of a drop in sales or increase in profits.

Mr. WENAAS: My comment would still apply. Previous to 1954 there were higher sales of farm machinery and higher output.

Mr. HORNER (*Acadia*): Not on their total sales.

Mr. WENAAS: In Canada, there was.

Mr. HORNER (*Acadia*): But Massey-Ferguson operates a world-wide operation. Their profits last year were something like 3 per cent, and their profit on capital assets was only 6 per cent. This is the point I am trying to clarify.

Mr. NOLLET: I guess you would have to go to the books of Massey-Ferguson to get your answer.

Mr. HORNER (*Acadia*): Then you are agreeing with me, in other words, that profits do not appear to be the culprit?

Mr. NOLLET: If this is correct, yes.

Mr. HORNER (*Acadia*): I am showing you where profits have come down and prices have gone up.

Mr. NOLLET: Yes.

Mr. HORNER (*Acadia*): And you would have a tendency to think prices should have come down?

NOLLET: Yes.

WENAAS: One of the problems is that Massey-Ferguson has not been on the same basis over the whole period; so, at the beginning of the period we are dealing with Massey-Ferguson's sales in the United States and at the end of the period we are dealing with Massey-Ferguson on a world-wide basis.

Mr. HORNER (*Acadia*): Massey's profits in 1954, when they were not incorporated as Massey-Ferguson, were 17.1 per cent, and according to the same report today their profits are 9.3 per cent on sales. Therefore, I do not agree with the argument you are presenting.

Mr. WENAAS: I have a reference here in our table F-3, on page A-38, and this is based on the annual reports of the company concerned prior to 1954. Prior to 1954 that company's statements were consolidated for United States and Canadian operations, and 1954 consolidation includes U.K. and Ferguson interests in the United States and Canada. The worldwide basis of consolidation came in 1956, or thereafter. Since that time there has been a further expansion of the company, so that unless the company is preparing its statements on a different basis it may be this is part of the explanation for the fact that the total sales of the company have not seemed to increase over the period.

Mr. HORNER (*Acadia*): No.

Mr. SLOGAN: What percentage of that profit would be taken up in inflation? The dollars were invested at a time when the dollar had a pretty constant value.

Mr. WENAAS: I think that would be a very involved calculation, and I would hesitate to answer the question just at the moment.

Mr. HORNER (*Acadia*): You cite total sales from 1956 to 1960. They were \$335 million in 1956 and they were \$426 million in 1960—no, that is the average—but they were \$490 million in 1960, and according to the Massey report they had sales of \$343 million in 1954 and in 1950 they were down around \$200 million. We are looking at the same figures; there is no doubt about that at all, but I am pointing out that while profits have decreased sharply the volume has remained relatively constant on worldwide sales. It is the same with International. Why have prices not come down if profit is the culprit? Apparently profit cannot be the culprit. That is the only conclusion I can draw and, if I am wrong, would you correct me?

Mr. NOLLET: There are a lot of other factors involved.

Mr. HORNER (*Acadia*): I agree, but we are narrowing them down to say profits cannot be the culprit.

Mr. NOLLET: This is why I say a very careful examination by a competent accounting firm is necessary so that the committee can get these answers. I too would like to get these answers.

Mr. MANDZIUK: The minister mentioned that some of these representations are coloured. Now, after listening to briefs presented by various suppliants one cannot help but come to the conclusion that each one tries to colour his own representation and that includes you, sir. In every evidence we get there is always someone else to blame.

This committee is concerned with the contributing factors which cause the prices squeeze and probably you and this committee have the same objective in mind, namely to relieve the farmers from that prices squeeze. We realize it is there but we want to know the contributing factors. We have had dealers here who say they are suffering from the prices squeeze. They claim they have a small margin on which to work and the farmer is such a horse trader that he squeezes out of them every possible cent of their profit, and reduces their profit to practically nil. We have had manufacturers come in here

and say that during the last number of years labour was the biggest profits, because wages have gone up. They have also pointed to the rise in the company contributed to the higher cost of the raw materials and process, the prices which they use. They have shown their annual statements and old saying that figures do not lie—but I shall not complete.

We know perfectly well that when labour representatives come they will try to minimize their share in this whole thing and try to minimize their blame. As I say, this committee has a task to sift through all this evidence and come to certain conclusions. What these conclusions will be it is pretty difficult to say, but I think this brief seems to be more concerned with remedies than with contributing factors.

You suggest nationalization of manufacturing establishments. You say there are nine companies, and you have a good argument there. You ask why not have one distributing agency instead of nine, but there is another side to that coin. If you do that you are going to deprive the farmer of the bargaining power of his horse trading instinct. Sir, I hate monopolies and so does every farmer. We have got to admit that the farmer is an individualist. He does not like to be told: "that is the only place where you can buy your equipment and they can charge you what they like". Whether they be private monopolies or state monopolies, I am against all monopolies and I believe all the farmers of Canada are against them too.

As an alternative, you suggest that if nationalization is not the solution then there should be a dictatorship establishment, a federal farm machinery prices tribunal, presumably meant to set profits at a certain level and no more. How popular is that going to be? It is a very interesting point you raise. We are interested in it because, when we started this inquiry I, for one, was under the impression that the trouble lay in the colossal profits which the farm machinery manufacturing companies were making. I think every farmer in the country thinks that is where the trouble lies, but the figures we get from those manufacturers seem to refute that point. Let us get the picture from all sides. You minimize labour but we know your presentation is coloured. We cannot deny that. There is no use denying it and I suggest we lay our cards on the table.

The CHAIRMAN: Would you like to ask your question now?

Mr. MANDZIUK: I did have a question in my mind.

Mr. NOLLET: About how badly am I coloured?

Mr. MANDZIUK: My question is this: you approve of tariff free entry of farm implements. Would you still be in favour of tariff free entry of farm implements if we nationalized the farm manufacturing business?

Mr. NOLLET: Absolutely.

Mr. MANDZIUK: You still would?

Mr. NOLLET: Let us not labour this blasted nationalization too much. After all, we use the word "could".

Mr. MANDZIUK: You are giving us your remedies but we want the causes so that we can make recommendations to parliament. We owe a duty to the country.

Mr. NOLLET: Will you size it up? I do not know what the question was, but I was going to say something only for the fact that a lady entered.

Mr. MANDZIUK: I am interested in showing you the other side of the coin.

Mr. NOLLET: Everyone will present their case; this is natural, I am trying to present a case to this committee from the point of view of the farmer.

Mr. MANDZIUK: That is the point of view I am trying to present.

Mr. NOLLET: It is up to you fellows to get the facts and to discover what tint or colour we are. I think we are making a very substantial case, as you have said yourselves. You know there is one problem—agriculture is in a depressed state.

Mr. FORBES: The situation is improving though.

Mr. NOLLET: Yes, and I must agree with this.

Mr. MANDZIUK: He is the best farmer.

Mr. NOLLET: His view is also slightly coloured.

Mr. MANDZIUK: You should see his farm—it is as good as any of yours in Saskatchewan.

Mr. NOLLET: Here is the thing I think we need to keep in mind also. I do not maintain that we can solve the farm problem by squeezing out every legitimate profit made by the manufacturer. This is not going to save agriculture, it will take much more. But I do say this, that in terms of nationalization and better servicing of industry we should do something; maybe “tribunals” is an unfortunate word but we need some manner or means or an agency to follow up your work. This agency would see to it that your recommendations are implemented. This has been the failure of the past committees, has it not? We can document the conclusions that were reached in 1937. You will be reaching almost similar conclusions, but in 1937 there was no follow-up to them. We are in the same mess again, only a bit worse. I hope there will be some follow-up so that we can nationalize the agricultural industry which will serve agriculture as it ought to in terms of the cheapest possible machines and in terms of service. We have talked a lot about this production, there are a lot more fields in which we will find common agreement, for instance in the field of distribution and this thing of casting machinery and maybe reducing the rapidity of model changes which are taking place. This is a big field where we can do a great deal of good to help the agricultural industry, but it will not solve the basic problem of agriculture, or at least I am not proposing that this will solve the basic problem.

Mr. KNOWLES: Mr. Chairman, I hesitate to prolong this argument and this discussion concerning nationalization and so on, but it would seem to me that we have oversimplified our close relationship with the United States, as was pointed out in the Massey-Ferguson brief. I know that everyone in this room is anxious to promote industry in Canada, and it is our ultimate aim; but they pointed out that great progress has been made in America in mass production and the ability to sell it to the people. The United States has some 200 million people to sell to—or close to that figure. We in Canada have only 17 million. It is pretty hard for us to cut ourselves off from the U.S. and to sell only to our people.

As a follow-up to Mr. Mandziuk’s question, I was going to ask what is our relationship going to be with the United States when we import from them so many components for our tractors and we get them cheaper from them because of their greater population? They can make them cheaper because of their volume. It seems to me that to cure this problem in any of the methods you have mentioned, whether it is nationalization, cooperation, or whether there is going to be government control, that we have to be able to do something with the United States as well.

You mentioned some industries that sell in Saskatchewan; there would not be more than one of those which would be wholly Canadian. What is our relationship or what is the solution going to be with the Americans? If we are going to do that, it seems we are going to have to get over the border into the United States to carry out your program.

Mr. NOLLET: This is something for the committee to decide—you will have to make up your minds. For example, assuming that you did set up the farm implement business on a publicly-owned basis to serve agriculture, you will have to make up your minds whether you can produce farm implements in Canada cheaper than you can elsewhere. If this happens, you will be dependent on farm implements from the United States unless you expand your domestically-owned industry tremendously. I think that the Americans always have and always will be able to produce cheaper than we can because of their volume—they have a tremendous market. I think they could do that. I believe that if the Canadian manufacturer were able to bring down his prices, the Americans would meet that competition and meet it effectively without injury to themselves. They are doing it in other markets, and I think they could do it here.

Mr. KORCHINSKI: I think, Mr. Nollet, you will agree that if you build a better mouse trap the world will beat a path to your door. Your brief suggests what I referred to, and you have stated on several occasions that through cooperatives and through nationalization and so on you may find the answer. You are quite aware that we have a minister of cooperatives in Saskatchewan; we have cooperatives formed in every community in Saskatchewan; we have the C.C.I.L. Why has not the world beaten a path, why has not everybody purchased C.C.I.L.'s equipment?

Mr. NOLLET: The answer is obvious. For one thing, I believe that if this cooperative had been handing a full line of equipment they would have increased their sales. I think also it is a matter of putting the Cockshutt policy within the cooperative itself. If they were bold and went into expansion campaigns—as I say we have three prairie governments which would be prepared to lend them money to expand. We did it before when they were first organized. Perhaps policy has something to do with it.

The other thing that has been mentioned here is that they are in competition with the sales agencies of other companies, well established companies, from which people have bought machines over the years. It is pretty hard to break that habit. I know I have certain preferences in farm machinery and I would probably take two looks at a cooperative. I know it is just as good as the discer I used from another company; but still I am used to this one. I think that if the C.C.I.L. had gone into manufacture and put a good machine on the market they would have a lot of business. This is my personal opinion.

Mr. KORCHINSKI: My next question is this: since you profess that this is one of the answers to the problem, has the Saskatchewan government purchased all their equipment—and they have a lot of it—through cooperatives?

Mr. NOLLET: We have purchased a great deal of it in our own department where we needed farm machinery and for the development of certain projects.

Mr. KORCHINSKI: Have you also purchased through other machine companies?

Mr. NOLLET: Yes, we have, although we have favoured the cooperative. However, they do not make enough lines. We used some of their lighter tractors which they produced, their seeders and mowers.

Mr. KORCHINSKI: Have you purchased from John Deere for example?

Mr. NOLLET: From John Deere also.

Mr. MANDZIUK: Do you not make your purchases on a competitive tender basis, or do you just favour one group?

Mr. NOLLET: They are on a tender basis. There is a choice as to the particular make.

Mr. MANDZIUK: Then there is the combine.

Mr. DANFORTH: I would like to ask the witness a direct question. I do not believe that it needs a very complicated answer, although it deals with a very important principle. The question is this. With the facilities that you have at your disposal and the completeness with which you have made this investigation, can you tell this committee if in your investigation you ran into any evidence whatsoever that would lead you to assume there was any undertaking or understanding or an attempt on the part of the machine companies to establish a uniform price to the detriment of farmers? In other words, do you believe in any way either directly or indirectly there is a combine in existence?

Mr. NOLLET: I certainly could not make a statement that there is. I do not know.

Mr. DANFORTH: Did you uncover any evidence whatsoever in any form that would lead you to believe there might be one in existence?

Mr. WENAAS: When industry is dominated by a few firms, there is no necessity for a formal combine to be arranged. I think it is highly likely that there is no kind of formal agreement of the kind that you suggest. However, in my mind, that is not the important point. The important point is that in this particular industry, as is true of a lot of industries, there are only a few firms so that they are in a position to control prices by limiting production. That is unlike agriculture where an individual farmer has no effect on price. If he stops producing anything, or if he does not produce anything, it has no effect on price. In an industry of this kind—and it is quite well recognized by some of the commissions which we have cited—it is not necessary for a combine to exist in order to maintain prices because the maintenance of the price is at the production end.

Mr. DANFORTH: I will phrase my question another way. Do you believe then, that for implements of a comparative nature between companies the almost uniformity of price is due to competition or due to price policy between the companies.

Mr. WENAAS: I would say the latter. I think it would be the policy, the price policy of any individual company, not to be very much out of line with the price of a competing implement. However, the point is that all these prices can be maintained by action of the farm machinery companies in cutting back production, limiting it to the market that they expect to have. I am not saying this is an unreasonable sort of thing. This problem arises out of the very nature of the industry, that they can maintain their prices without any necessity for a formal combine.

Mr. DANFORTH: You say, then, that it is an assessment of the market capacity rather than by an agreement between companies, that the prices are maintained?

Mr. WENAAS: In my mind there would not be any necessity for a formal agreement among the companies. It is also quite clear that the companies may have a common assessment of the market. Certainly they are in contact with each other, and they are aware in that sense of what their thinking is. Therefore, I would expect that you could turn over every little stone and you would not find any evidence of a formal contact. This is just a personal opinion. We are not in a position to investigate the companies out in Saskatchewan because such companies as are in Canada are located in Ontario, their offices are here, and we would have no reason to know of a combine even if it did in fact exist.

Mr. DANFORTH: I would like to ask the witness if there is a definite advantage to a farmer to purchase machinery through a co-op; and, secondly, would it be possible to establish cooperatives that would deal not with the manufac-

ture, but simply with the distribution of machinery. Could they be made to work to the advantage of the farmer, by the fact that they would have such an increase in purchasing power and could make competitive bids and pay patronage dividends as Mr. Mandziuk suggested,—and in effect obtain a better price and put the farmer in a better bargaining position. And if such is the case, how would the used machinery part of the business be taken care of?

Mr. NOLLET: I would answer the question categorically, yes. The used part of the business could be taken care of just as it is at the present time by C.C.I.L.

I might make this observation in connection with second-hand machinery. One of the bad things of this whole field is the unrealistic trading values that are allowed. That puts the smaller dealer behind. He loses his commission in this transaction. I do not think that is sound. That is my own personal opinion in the administration of the act in the province. However, I think the farmers like it, but I do not think it is sound business. The C.C.I.L. permit trading allowances, but they are not as generous as some of the dealers have been.

Mr. DANFORTH: I am not too familiar with the operation of your co-ops in this machinery business. Would it be possible for a farmer in the business of purchasing a combine to go to the co-op to say he would give "X" dollars—over and above buying this machine from another authorized dealer in the area?

Mr. KYLE: I was going to make the observation that you might get very specific information in regard to the question by a quick look at the C.C.I.L.'s annual report. They set out very carefully their patronage dividend, their share capital and so on.

Mr. DANFORTH: It is either yes or no; it is to their advantage, or not to their advantage.

Mr. NOLLET: It is to their advantage.

Mr. DANFORTH: Could I save "X" dollars on the purchase of a combine by going to a co-op and joining, or doing whatever is necessary, over and above purchasing it by going to another dealer in the same district?

Mr. KYLE: I think the answer would be yes on the basis that you are saving; but the saving might not necessarily be in cash at the moment, it might be share capital in the co-op, or the patronage dividend at the end of the year's trading, whatever the by-laws provide.

Mr. DANFORTH: In effect I would have to pay "X" dollars, as I would in the case of the other machine; so in effect at the time of purchase there would be no saving?

Mr. KYLE: That is right.

Mr. MANDZIUK: This is a supplementary question. Would you have statistics to show by what percentage the prices of machinery—that is, of C.C.I.L. machinery—are below those of private industry. By what percentage is it lower than that, taking into consideration the patronage dividends or whatever you call them in the final analysis. Would it be 11 per cent? Would you say that, or what would it be?

Mr. WENAAS: We have no such statistics; I think it would be quite an involved calculation. I do not know whether even C.C.I.L. could tell you.

Mr. MANDZIUK: The C.C.I.L. dealers are not free, or have not a free hand to permit this horse trading in relation to the price?

Mr. KYLE: I think it is very much so.

Mr. MANDZIUK: They do?

Mr. KYLE: Yes.

Mr. FORBES: On the same point, you were expounding the advantages of the co-op method. Let me quote from the C.C.I.L. presentation, on what happens in the case of machines in the United States. I will read one paragraph:

The United States machine manufacturing cooperative was allowed to go into bankruptcy in 1952 with a loss to the shareholders of over \$3 million.

I think that is all I need to say. The rest of you know the story. Several co-ops were set up in the United States, purchasing machinery from Cockshutt at a greater discount than C.C.I.L., but they all went broke in the business. That is one of the reasons why C.C.I.L. have not expanded here to the extent some of us hoped. Yet, they have almost all the same kind of machinery as manufactured by others, plus discs and so on manufactured by themselves.

Mr. SLOGAN: Mr. Chairman, I am still on this subject. I think I am in line there somewhere, and I have been for the last half hour. I think there has been a certain amount of buck-passing by the farm organizations and by the provincial government. The C.C.I.L. has only covered 2.7 per cent of the market in western Canada, yet a similar co-operative in the province of Quebec has covered 30 per cent of the market there. You have said that your government is in favour of co-operative enterprise, and the farm union members also stated that they were. I think there is a lot in the policy of the C.C.I.L. which has made them a lot less popular over the last few years I think we can conclude that it is not a successful organization at the present time. But before we start to nationalize the manufacture of farm machinery, do you not think that if the provincial governments and the farm organizations would get hold of the C.C.I.L. and sit down with them they could draw up an incentive policy which would help them to capture the same proportion of their market as has been done by a similar co-operative in the province of Quebec? Do you not think we have been moaning and groaning too much?

Mr. NOLLET: I think you are dead right, and I hope when you get through with the committee here you will favour looking at this carefully with the idea of getting the provinces together with the co-ops to look at the whole picture and see what we can do in this field. I, personally, do not think we are doing enough. It may be that some of our techniques are wrong in Saskatchewan, but I think it should be done.

Mr. SLOGAN: Would you not agree that the basic policy of the C.C.I.L. is fundamentally wrong, because the farmer is going to buy where he can get the lower price? In the province of Quebec they are selling at a lower price, and that provides the main incentive. So I think if we could rub out some of these idealistic concepts, we might have an organization which would make it successful, if we wanted it. I think we should stop passing the buck, and get down to work on it.

Mr. NOLLET: It is a principle of co-operatives never to start a price war, because the big boys can beat them out. Maybe this is a method which should be adopted.

Mr. HORNER (*Jasper-Edson*): Would you agree that a further equalization of freight rates would help the farm machinery industry in western Canada?

Mr. NOLLET: I would think so.

Mr. HORNER (*Jasper-Edson*): Would you feel that the people in Saskatchewan—and I am from Alberta myself—are willing and ready to accept equalization of their materials which they are selling to other parts of Canada? I have in mind such things as fertilizer, oil and gas production, and the by-products therefrom. Are you in western Canada ready to accept equalization of transportation costs on those products?

Mr. NOLLET: I think we ought to be, if we ever want to find a solution to the transportation problem.

Mr. HORNER (*Jasper-Edson*): What is your position in regard to the possibility of machinery companies arranging for agreed charges for the movement of machinery to western Canada on the railway? The machine companies, when they were before us, said they were not able to arrange for agreed charges because there was no competitive method of transportation with the railways. I do not agree with that statement, because I think there is competitive transportation. Maybe this is something which should be looked into further, but I would like to have your opinion.

Mr. NOLLET: I agree with you, that it certainly should be looked into further.

Mr. HORNER (*Jasper-Edson*): What about the position of the province of Saskatchewan with respect to agreed charges generally? Are they going to accept them?

Mr. NOLLET: I would not want to give an opinion on that because I really have not gone into it too much.

Mr. HORNER (*Jasper-Edson*): Thank you.

The CHAIRMAN: Gentlemen, the time has passed 4:30 and I had hoped that the committee might endeavour to finish by six o'clock. I suggest that we incorporate the last five sections and ask our questions on all those sections combined. Would that be agreeable to the committee?

Mr. HORNER (*Acadia*): I do not see how that would speed up their brief.

The CHAIRMAN: Many of the questions that have been asked in the last half hour should have been asked on some of the other items.

Mr. HORNER (*Acadia*): No. I think the transportation question was the first one asked outside of section two. That is my opinion.

The CHAIRMAN: It is up to the committee as to what you wish to do. I would like to have your opinion. Is it your wish that we incorporate the remaining five sections and ask questions on them all at one time?

Mr. HORNER (*Acadia*): It would just spoil your report, and I do not see how it would speed up your work.

The CHAIRMAN: Very well. We shall carry on with number two, then.

Mr. HORNER (*Acadia*): First of all, on page 32, you deal, sir, with the question of nationalization. That has been buffeted around here quite a bit. And you go on to say that you would set up a national agency to manufacture and distribute farm machinery in Canada. You say that such an agency could either establish its own system of distribution or provide for the development and expansion of farmer-owned co-operatives for that purpose and perhaps also employ in some instances the private distribution agencies. This is the part I want to question you on. I am a member of two different farm co-operatives in Alberta, and I always have thought that the co-operative had a special place in a farm locality in particular. But there is a lot of talk these days to the effect that co-operatives cannot make a go of it, unless they have a monopoly. You would not agree with that, would you?

Mr. NOLLET: No.

Mr. HORNER (*Acadia*): Then why do you suggest we set up a sole marketing agency and give it to a farm co-operative?

Mr. NOLLET: In the event that there is a national agency set up, the suggestion would be first that a co-operative distribution organization might complement it, in such an event.

Mr. HORNER (*Acadia*): You also stated that if the C.C.I.L.—and that is the co-operative I am referring to at the moment—wished to buy out Cockshutt,

that the Saskatchewan government would be willing to loan it the money, or to stand behind it.

Mr. NOLLET: We are not advocating it in terms of buying out a company, but in expanding their organization.

Mr. HORNER (*Acadia*): Mr. Mandziuk used Cockshutts and you agreed. You used the phrase that this was a possibility which at one time was considered. But would that not put the C.C.I.L. in a competitive position with the other nine distributing firms that you have in Saskatchewan? It would not need any more than this to survive, would it? I certainly hope not.

Mr. NOLLET: No. This is an agency, and if a national agency is set up to manufacture and distribute farm machinery, this would be one agency, only, and there would be other major companies in the field. It is suggested here that the machinery of distribution could be worked by a co-operative method, and to that extent it certainly would be a monopoly.

Mr. HORNER (*Acadia*): Actually a farm co-operative does not need a monopoly in order to survive.

Mr. NOLLET: No. I think the co-operative movement generally hopes that they will co-operate with the rest of the economy so that it will all be a co-operative some day. But that is probably just a pipe dream.

Mr. HORNER (*Acadia*): Surely rather than nationalize industry, surely if you permit the co-operative idea to lower machinery costs, actually the C.C.I.L. was born in the 1937 report. Many people refer to it as such. Would it not be a form of co-operative in a very competitive position if it was in the manufacturing industry, and your government should lend it enough to buy out a manufacturing industry?

Mr. NOLLET: Yes, I would agree.

Mr. HORNER (*Acadia*): I have other questions on section two, but if somebody else wishes to ask questions, I will defer them.

The CHAIRMAN: Mr. Pascoe, do you have a question on section two?

Mr. PASCOE: No. I must apologize for having to be in the house for a while, when I missed some of the proceedings. Probably some of the questions I would have asked have already been asked. But I shall ask one general question in any event. How was this brief prepared? Was it prepared with the help of a lot of farmers? Does it reflect the views of the farmers, would you say?

Mr. NOLLET: I would think so. It is based pretty much on the information that came out of the previous investigation at which time submissions were made by the farm organizations. This matter has been discussed with the farm organizations. In fact I think we have given some help to some of the farm organizations in the preparation of their briefs. I think it would pretty well reflect it, but not all together. We are presenting this as a government brief.

Mr. KORCHINSKI: On page 23 you state that a special committee on farm implements of the Saskatchewan legislature found that evidence submitted to the committee indicated that the manufacturing companies have made very high profits in the past few years. You will agree, of course, that you cannot carry on without making a profit.

Mr. NOLLET: Yes. It depends on what you call a profit. What we are saying is that they were high in that period of time. This was the opinion of the official select committee of the Saskatchewan legislature in 1952 and it is still our opinion. With sales going down the margin of profit in the past few years has not been so great. The same thing happened in the thirties. There was a good period up to the thirties and then it went down.

Mr. KORCHINSKI: What would you say would be a fair profit?

Mr. NOLLET: The question was asked earlier. Someone asked if five per cent was pretty good and I said I think it is pretty good.

Mr. HORNER (*Acadia*): The question was, is five per cent a minimum, and you said yes.

Mr. KORCHINSKI: If Massey-Ferguson made three per cent it would not be a good profit?

Mr. NOLLET: It would probably keep them in business.

Mr. HORNER (*Acadia*): In the pages leading up to page 32, and before page 31, you suggest that maybe nationalization would cut down machinery costs. I think you perhaps have in mind particularly distribution. Or are you thinking of manufacturing?

Mr. NOLLET: Both.

Mr. HORNER (*Acadia*): Actually in the figures presented to you by the international company—and always keeping in mind the 1937 report and the Massey-Ferguson annual statement—it was evident that the cost of goods was about eighty per cent of the recovery from sales. This was evident in the Massey-Ferguson annual report. They say that the cost of goods was \$390 million and their total sales were \$490 million. It looks like seventy-nine or eighty per cent was the cost of the goods. International Harvester suggests, in the making of a windrower in 1960 the cost of material amounted to sixty per cent and the cost of labour amounted to 41.4 per cent. Then they go on to list factory overhead, fuel, engineering, depreciation and so on at eighty per cent. Do you think that nationalization would cut down particularly on this?

Mr. WENAAS: In regard to that I would say that perhaps we have not explained quite satisfactorily enough what we believe. We are not really thinking of nationalization of the industry just in order to cut out the profits and say that that will mean a great deal of reduction in farm machinery prices. What this is being looked at as is a method of rationalizing production.

Mr. HORNER (*Acadia*): By rationalization do you mean standardization?

Mr. WENAAS: Standardizing.

Mr. HORNER (*Acadia*): In other words you would only make one model. Instead of making nine 5-plow tractors you would make one.

Mr. WENAAS: It might be one or two; but in any event it is this type of rationalization. I notice in the Massey-Ferguson statement before this committee they indicated they could reduce the cost of manufacturing certain items if they had longer runs. I think this substantiates our contention that if you had production more efficiently organized you might not reduce the percentage that anyone of these components might have of the total cost of manufacturing, but you might reduce the total. We are not in a position to say just what this might mean. It seems to us that this type of rationalization of production will reduce the cost of production. However, we have no figures that would indicate whether it is five per cent or ten per cent. As a matter of fact I understand when Massey-Ferguson was before you they did not have any figures with them even as the total cost of manufacturing certain items. So, this is a subject for examination. We believe it is a sound principle that if you rationalize production you are going to reduce the cost of manufacture.

Mr. HORNER (*Acadia*): In a sense you are basing that on the one fact that volume is not high enough and that you would increase the volume of the 5-plow tractor instead of mixing it up with four different tractors.

Mr. WENAAS: Yes.

Mr. HORNER (*Acadia*): With regard to distribution you also said you thought there were two areas in which nationalization would cut down. In distribution you believe there could be substantial savings made. In their

annual report, Massey-Ferguson said their marketing expenses were \$46 million; this is out of total sales of \$490 million, which would be roughly less than ten per cent and really around nine per cent. To me it looks to be nine per cent. Leading from that and saying that distribution or marketing expenses are nine per cent and general administration expenses \$15 million which would be another three per cent, the point I am trying to make is you have a total of maybe twelve per cent. It is evident, by the C.C.I.L. brief that in the period from 1947 to 1954 they were able to return to the purchaser larger cash dividends because of their savings due to distribution mainly, but from 1954 on their returns to the producer were very small indeed; in fact I think it got down to where there were not any at all. In other words, in the last few years they were saving very little on distribution. Am I right?

Mr. NOLLET: I think so.

Mr. HORNER (*Acadia*): How could you save anything on distribution if C.C.I.L. could not without cutting down the service to the farmer, always bearing in mind service must be maintained.

Mr. NOLLET: I think it could be done, because at the present time there is a great deal of duplication. The fact that C.C.I.L. has not been able to make the same savings as formerly is they have had to fit into a pretty expensive system of distribution.

Mr. HORNER (*Acadia*): If it is expensive they should have been able to return larger dividends in the last few years.

Mr. NOLLET: It is expensive in terms of adequate service and the needs of the farmers. I rather question this 12 per cent. But, again, I do not know. This is a statement of the company. I would think that their distribution costs would be much higher.

Mr. HORNER (*Acadia*): I am using their statement to the shareholders, and I imagine that this is a chartered accountant's figure.

Mr. NOLLET: There have been quite a few charges passed on to the dealer which have been absorbed in his commission. As you know, the credit part of it was pretty well taken care of through the farm improvement loan scheme up until recently, and since then there seems to be a tendency to go to other lending agencies. However, these are factors. I do think that much better service than what we are getting now could be given at reduced cost.

Mr. HORNER (*Acadia*): I have one other question, which concerns section 2. I am referring to page 33. You suggest setting up this price tribunal for the purpose of setting the prices on farm machinery. Then, you go on to say:

To determine whether this price is justified by cost of manufacturer and if necessary, to rule that the price must be reduced.

I am wondering whether this would not have had some effect on the quality of the product. In other words, I might put in sealed bearings in the manufacturing of my combine and, as this price tribunal tends to get away from the farmer—perhaps I should not say that, but that it tends to get away from the land—they do not know just exactly what this improvement is worth to the farmer, or what it costs. I think this would have a tendency to limit quality improvements. Do you see any possibility of this happening?

Mr. NOLLET: As you will note, we recommend the establishment of an advisory technical body, possibly attached to the proposed federal farm machinery prices tribunal.

Mr. HORNER (*Acadia*): I am dealing with the first paragraph. First, you recommend the establishment of a federal farm machinery prices tribunal with authority.

Mr. KYLE: If I might interject, this second paragraph provides for an addition of an advisory technical body, in anticipation of the problem you brought forward. This arm would see that that sort of thing was covered.

Mr. HORNER (*Acadia*): In other words, you did envisage that if a mandatory price tribunal was set up, it might have some effect over the years on the improvement of quality?

Mr. KYLE: Yes, and to safeguard that possibility which you mentioned this arm should be here.

Mr. HORNER (*Acadia*): You actually have the two recommendations; are you envisaging the two working together?

Mr. KYLE: Yes.

Mr. HORNER (*Acadia*): Oh, I see. Well, then, this would be enlarging the civil service to quite an extent, in order to guard this.

Mr. NOLLET: All we are doing is imposing price controls on the farm machinery industry.

Mr. ROGERS: To carry that further, this entails standardization of models, does it not?

Mr. NOLLET: No.

Mr. ROGERS: How are you going to do that in our position here? Are you going to do it in Canada alone, or in the United States as well? Are you going to put controls on imports to make sure that they bring out a standardized model?

Mr. NOLLET: I think if you set up a testing agency, that an imported standardized model will sell in competition to anything else.

Mr. HORNER (*Acadia*): Would you just set up this tribunal for Canadian manufactured goods, or would you set it up for American, Great Britain, Germany, and so forth?

Mr. NOLLET: We would not have any control over the costs in relation to people outside of Canada, but we could give them direction in terms of rationalization and so forth. The very fact that you have suggested a board in Canada would have a salutary effect. I think the manufacturer outside of Canada would meet our requirements.

Mr. HORNER (*Acadia*): Not unless we forced him.

Mr. MANDZIUK: He would have to meet our competition.

The CHAIRMAN: Gentlemen, I am informed that there is a possibility of a vote taking place shortly after five o'clock, which would automatically adjourn the committee. It will be impossible to meet again on this brief until—

Mr. MANDZIUK: Are we going to keep these gentlemen over?

Mr. HORNER (*Acadia*): Mr. Chairman, we are only at page 34 and there are 67 pages in the brief.

The CHAIRMAN: As you know, we have asked John Deere to appear on Monday.

Mr. HORNER (*Acadia*): What about tomorrow morning? We could meet at 9.30, before the house sits, and wind it up then.

The CHAIRMAN: It is up to the committee. Does the committee wish to meet tomorrow morning?

Mr. NOLLET: We have our reservations made for tomorrow.

The CHAIRMAN: Have you them made for tomorrow afternoon?

Mr. NOLLET: No, we are scheduled to leave at 6.30 in the morning.

Mr. MANDZIUK: I have a few questions to ask.

The CHAIRMAN: I was just thinking, with the time we have left, if we kept our questions and answers brief, we possibly could make much better progress?

Mr. NOLLET: If I may say so, Mr. Chairman, we have kicked this subject around quite a bit now. Could we move on to A.M.A.—agricultural machinery administration and testing. I think the formation under this subject would be very helpful, and this is a field of activity that we could do something with, here.

The CHAIRMAN: It seems to me that section 4, distribution costs of farm machinery, has been pretty well exhausted. Several questions have been asked in this connection.

Mr. ROGERS: Mr. Chairman, I would like to follow along on the line of questioning I was on because I am interested in standardization, but I do not know how it can be brought about. I know that every time they make a new model, it costs money for tooling. I think we could save a great deal, but I don't know how you are going to put it into effect. That is what I would like to know.

Mr. MANDZIUK: What section are we taking now, Mr. Chairman?

The CHAIRMAN: We are still on section 2.

Mr. NOLLET: Standardization.

Mr. KYLE: The American society of agricultural engineers has probably made a very significant contribution in this area to date, by arriving at some common ground in terms of standardization, and the manufacturers have adopted these standardizations. Probably this is the sort of area that might be continued for other items of standardization and manufacturers would agree, no doubt, after proper consultation. I would suggest that this might be a course of action that could be followed.

Mr. ROGERS: I agree. I think this is the area where we could do a lot of good, but I do not know how it could be put into effect. That is my worry.

Mr. MANDZIUK: There is a good argument in favour of it.

Mr. ROGERS: Certainly.

Mr. MANDZIUK: If nine different firms make nine different models, that is a total of 81. I am not saying that there are that many on the market, but that is what I mean.

Mr. NOLLET: There is one thing that sticks out clearly, and it is this: The fact is that it will never be done by the companies themselves, by virtue of their setup and the competition between them. Some agency will have to step in and give direction to them. If you would like any information in this regard, we will be glad to supply it to you.

Mr. ROGERS: Mr. Chairman, I think we should go one step further. Do not forget that machinery company officials will have read these reports. They will know what has been discussed, and will be alert to them, even if we do not follow it through. However, I hope we do.

Mr. WENAAS: Another point that might be worthy of study is in terms of standardization of equipment with one particular company, which might be more easily met by a manufacturer than between several manufacturers. I am thinking of items like the header board components of swathers and combines, and so on.

Mr. FANE: And mowers.

Mr. NOLLET: Yes, sprockets, and so forth.

The CHAIRMAN: Is it agreeable that we go on to section 5—public testing services for farm machinery?

Mr. HORNER (*Acadia*): I have one question on distribution costs. This is not in connection with the regular brief, but with the briefer brief. I should like to know what you mean by this sentence at the end of the third paragraph on page seven:

We recommend that one of the matters that should be studied is the present dealer appointment policy.
Could you elaborate on that to some extent?

Mr. NOLLET: Mr. Kyle is in charge of that.

Mr. KYLE: In our opinion this is an area which has given rise to considerable difficulty on the part of farm implement dealers, because of the policies of some manufacturers in continuing to appoint dealer outlets in very close proximity to existing dealers, thereby putting them in such a highly competitive position that they are unable, financially, to provide the type of service that farm people are demanding of them.

If it were possible to convince manufacturers that in appointing new dealers some consideration should be given to the possibility of whether or not they are going to be able to make a financial gain, in relation to other competitive dealers selling the same line of goods, probably in the end this might be beneficial to the dealers themselves, and they would be in a position to provide better service to farm people. That is simply all that is involved.

Mr. HORNER (*Acadia*): I have a supplementary question, or maybe two. The first one which comes to my mind is that the Saskatchewan government has some sort of organization which has some jurisdiction over dealers. Am I right?

Mr. NOLLET: Yes.

Mr. HORNER (*Acadia*): And would that organization ask a dealer in any place to close up? Does a dealer have to have certain qualifications before he can open his door to handling machinery?

Mr. NOLLET: The answer to the question would be "yes", but it is dealt with on a company basis. When you say "open his door" I presume you mean a new appointment, and this is the area upon which we are working.

Mr. HORNER (*Acadia*): I am thinking of existing appointments. My constituency runs up 200 miles of the Saskatchewan border and therefore I get stories across the line. I have heard a story that this organization which we are discussing can ask dealers to close up their shops in one town and move to another town.

Mr. NOLLET: No.

Mr. MANDZIUK: But you could do so by refusing them a licence.

Mr. NOLLET: We have pointed out the idea that by licensing dealers and setting standards of service we might be able to solve the problem. Although we are very limited in this regard, as Mr. Kyle has said, we have carried on extensions with dealers, giving them a set of books and inventory methods and that sort of thing. However, the stickler in this program of ours is that the little dealer in a small centre is unable to compete with a larger dealer, with the result that he has tried to compete by forfeiting most of his commission and, when he does that, he is not able to meet all the requirements set out under the act for his dealer establishment.

Mr. HORNER (*Acadia*): Just to follow up on that and to understand that I interpret your remarks rightly, you mean he gives the farmer a good deal in whatever line of machinery he is carrying?

Mr. NOLLET: A better deal than he could afford, with the result that he does not have the money to put into repair parts in order to give the service which is expected of him. I do not want to assume the responsibility under

the act and say: "Chum, close your door". Such a dealer may be giving a retail service and taking orders.

I believe we have placed the onus of responsibility in the wrong place. We should have placed this onus of responsibility on the companies and told them: "Let us rationalize your whole distribution setup." In fact, we had the companies in and we suggested 60 repair depots. Maybe we were too ambitious, trying to get too many, but we do try to set up repair centres so that such a service would be within 50 miles of any farmer wanting it. If that were done we would not be worried about the balance of the dealers. They could be order takers.

All we are interested in is giving the farmers as good a service as possible. This distribution angle will not come under your jurisdiction. It is a provincial matter, but we have suggested that after you have completed your present examination you should call together representatives of all the provinces, representatives of the farm organizations and of the manufacturers and dealers, particularly the dealers because they have a very important stake in this and could make a very valuable contribution. At such a conference we could then see if we could work out a rationalized distribution system that would give the farmers the best possible service at the lowest possible cost.

The reason I suggest this is because if all the provinces went into it together there would be no discrimination against anyone if we could agree on a uniform basis. Our experience in Saskatchewan of putting the onus of responsibility on the dealer has not brought the results we anticipated it would, but I believe the suggestion we make now could be beneficial.

Mr. KORCHINSKI: Have you increased your licence fees during the last few years?

Mr. NOLLET: No, we have reduced them.

Mr. KORCHINSKI: I am talking about licences for dealers.

Mr. NOLLET: We put them up once and we reduced them again.

Mr. KORCHINSKI: I understand they were \$5 and they are now \$25.

Mr. NOLLET: No, they are \$10. However, I should point out that as soon as we started licensing dealers they seemed to look upon this as a franchise. The implement dealers reasoned that they would like to have a franchise almost for an exclusive area but are we, as governments prepared to do that? Are we prepared to give a complete area to one individual? Probably we could justifiably do so if it were the case of an original agency which would be responsible for all repair services in an entire area, and which would be representing a number of companies. This is the boy who could get substantial commissions in order to make it possible for him to fulfil that obligation, and the balance of the smaller agents might be looked upon as small commission people, with no responsibility for repair parts or service. This may be the pattern for the future and it could be a real improvement on the hodge podge we have now.

Mr. HORNER (*Acadia*): The federation of dealers associations appeared before this committee and submitted figures on this question. One of the charts they submitted listed Saskatchewan. I wonder do you agree with it, that the ratio between each dealer there is 24.3 miles. In other words that is the trading area.

Mr. KYLE: We do not agree with this.

Mr. HORNER (*Acadia*): The federation also gave the number of competing dealers, the average number of competing dealers in trading areas, and they listed the provinces of Canada as follows: the Maritimes, 2.5; Quebec 3.9; Ontario 7.6; Manitoba 5.6; Saskatchewan 6.9; Alberta 6.3 and British Columbia 0.1.

In other words you have the largest trading areas in Saskatchewan and the greatest number of different dealers, 6.9, and competition among dealers would be as hot as in any other part of Canada. This would tend to make one think that the Saskatchewan farmers are getting as good a deal under the present distribution system as other farmers in other parts of Canada.

Mr. KYLE: Certainly, on the initial sale.

Mr. NOLLET: The distribution area would be bigger because our rural population is not as dense and our productivity is smaller than in some other prairie provinces. On the other hand, if you cross to the United States, the dealers service a much larger farm area. This process of the little fellow being liquidated over a period of time has accelerated across the border and most of them over there are substantial dealers.

Mr. PASCOE: Mr. Chairman, before we pass on to another matter, on page 29 of section 2 of the main brief you say:

In Saskatchewan today there are nine major manufacturers of farm machinery offering complete lines of equipment although three companies make up by far the largest sales.

It would appear that this brief is arguing for fewer dealerships further removed. How would the manufacturers react to this and what would the effect be on the economy of a small town to have some of the dealerships removed?

Mr. NOLLET: We recognize this trend, that there is a movement to larger trading centres in the province, and we were thinking, for the main servicing and repairs and overhaul that we ought to take it in terms of regions. If an implement dealer had this responsibility he would of necessity need greater commissions or other compensation, then you could have the other smaller dealer who probably would not get the small commission because his work does not involve the same responsibility, he would be more or less on a sales commission. Assuming we had regional repair depots he could take orders, or else the farmers may wish to go direct if he is only 50 miles away from a place from which he can get service. These are trends and we are thinking of making readjustments without hurting people.

Mr. PASCOE: Perhaps this question has been asked before, but are you trying to suggest then that the dealerships handle more than one line?

Mr. NOLLET: Yes, I would think so very definitely.

The CHAIRMAN: Section 5, public testing services for farm machinery. Any questions on that?

Mr. KORCHINSKI: I have a question on that. The Saskatchewan government does testing. Have they made any specific recommendations to machine companies to standardize certain lines of machines and certain parts?

Mr. KYLE: I believe this question came up previously, sir, and the answer is no. No specific and general recommendations have been made to the manufacturers in regard to standardization, but occasionally in the recommendations to the manufacturers in the public test reports there would be a recommendation that would have reference to this area.

Mr. KORCHINSKI: Could you perhaps explain the following: you find that perhaps there is a certain part that is weak and does not stand up to the strain, how do you go about inducing the company to make the changes so that they accept these tests and make the changes themselves after testing them?

Mr. KYLE: This might be a good point to clarify, a point I believe which was made to the committee during the presentation of the Massey-Ferguson report, that the testing program in Saskatchewan was other than a voluntary testing program. I think we should make it clear that it is a voluntary testing program and therefore there is just no way to do exactly what you have said.

The procedure that is followed is to indicate in the public test report a recommendation to the manufacturers to make a particular change, if it appears reasonable to make such a recommendation. That in itself is the only incentive for the manufacturer to do so.

Mr. KORCHINSKI: Is there not a duplication of testing here? For example, Massey-Ferguson told us that they spent all kinds of money on testing their own equipment, and here we are testing the same kind of equipment and perhaps we do not do anything after having found that there was a weakness in the machinery; we merely make a report and nobody looks at it. What good is such testing? I cannot seem to be convinced. There must be some value in it, but I am not wholly convinced from what you say that anything is done about it.

Mr. KYLE: The very fact that this report is published is really quite an incentive for the manufacturer to make adjustments or changes. It might be more specific to say to the manufacturer: you must do this. But at the present time it is a voluntary approach and this is the way it must be done.

I might add one other point. Our very short experience in this area has indicated, and the requests from farm people would also indicate, that there are really quite a number of farm people reading the reports.

Mr. KORCHINSKI: What method of distribution of this report do you have, how much circulation is there?

Mr. KYLE: The total circulation at the moment in Saskatchewan is just over 9,000. Just over 8,000 of those have come about as the result of written requests from farmers to get the reports. They are sent out to them on a mailing basis. In the province of Alberta, which province has supplied and is supplying an operating grant to our province for assistance in this testing program, the distribution is over 500 at the moment, but the Alberta department of agriculture have them available to agricultural representative offices and other places as well. In the province of Manitoba I believe the figure is something around 150, and it is going directly to the farmers.

Mr. KORCHINSKI: I have never seen one of these reports; how do I go about getting one of these reports?

Mr. KYLE: I thought we had sent out a group for each member of the committee, but it is very easy to obtain them.

Mr. KORCHINSKI: I should clarify this. I meant I had not seen them up to this point.

Mr. KYLE: Your question is, how would you obtain one at home if you wanted one? Just simply by writing to our department of agriculture and ask to have your name put on the mailing list. This is how it would be done.

Mr. KORCHINSKI: Would you recommend that this type of service be expanded, and while you are expanding it that some of the machine companies should do this testing also? Would that be your recommendation?

Mr. KYLE: We are recommending that the testing program be expanded. When you add to the question that the machine companies do this also, I think we are really talking about two different things. The point, I believe, which might be significant to make, is that notwithstanding work that the machine companies do in terms of research or field testing, this information is not available to the farm people in a public and unbiased test report. That is the point.

Mr. SOUTHAM: I am very interested in this public testing service. I note that on page 48 you say that 21 countries outside the Soviet bloc are now using testing services and that England has been using them for almost 18 years. You state that the Swedish government agricultural machinery testing institute was first established in 1897 and has grown progressively since that date.

Would you suggest, from the benefit of the experience you have had in Saskatchewan, we should develop federally a testing institute so that every farm machinery organization selling farm machinery in Canada would submit all their machines to us and get a test certificate? My personal view is that that would be the ideal way to do it.

Mr. KYLE: I can answer that by making the observation that the Swedish station or Swedish institute referred to here is also a voluntary organization, and on this basis most, if not all farm machines, as they tell us, are tested. To be specific, and to answer the question specifically, our recommendation is that this is in effect what should be done. We recommend two such units, one for western Canada and another for eastern Canada, jointly financed by the provinces and Canada.

This thought was predicated on the idea that there are many significant differences between machines used in eastern Canada and those used in western Canada. That is the reason for the two units.

Mr. SOUTHAM: I agree with that, and I think there is such a diversity of problems that we would need the two centres. I myself think this would be a logical conclusion and that a recommendation should be brought in by this committee to that effect. It would be something which would do some good.

Mr. KYLE: We would like to have it considered favourably.

Mr. HORNER (*Jasper-Edson*): Do these people use these reports? Do Massey-Ferguson come to you and say: "Could we have 10,000 of those?"

Mr. KYLE: My answer can be quite specific. We anticipated the possibility of this sort of thing happening and the act, when passed through, was made broad enough to cover it. I can leave with the committee the regulation which specifically outlines that the manufacturer could use these test reports in three different ways only. They can publish the test report completely in their advertising literature, just exactly the way it was written, from front to back. Or they can state that such a machine was tested. Or they can use excerpts from it, provided the excerpts is cleared through the department office to make sure it is kept in context. Further, the fourth point here would be that there is also a regulation that makes it a felony to use this report on the basis of approval or recommendation of their machines.

Mr. HORNER (*Jasper-Edson*): Have they used any of them so far?

Mr. KYLE: Yes, they have. At least one of the major manufacturers has purchased some copies of reports from us. We certainly do not provide them free. They have purchased some complete reports from us and distributed them through their dealer organizations, presumably for use in a selling way.

Mr. KORCHINSKI: Are these tests conducted with a view to ascertaining the machine's capacity or capability, or is it with a view to recommending specific changes for our conditions?

Mr. KYLE: The answer is that it applies to both cases. Both functional and structural analyses are made of the machine. Basically the purpose is a similar purpose to the N.I.A.E. organization in England, which has been referred to, and many of these other testing organizations. That purpose is to provide performance information on this machine, as to how well and how adequately it does the job it was made to do, under the kind of conditions we are interested in in western Canada, in Saskatchewan. Along with that sort of evaluation, goes the structural evaluation. As a result, there is knowledge in terms of its structural characteristics, and the obvious conclusion, then, is a recommendation to the manufacturer, if such is considered realistic.

Mr. KORCHINSKI: Do you employ a staff of engineers to do this type of testing?

Mr. KYLE: Yes, we do, but it very limited.

Mr. COOPER: Do you think that this is a fair test? Do you not think that a test on the farm would be better? In a case of new machinery last summer, \$200 worth had to go in for a new job on that machinery, in complete rebuilding.

Mr. KYLE: The technique which A.M.A. uses is field testing. This is really the basis for it. These machines are worked for what is estimated to be about half of their normal lifetime, doing the actual operation right out on the farms throughout Saskatchewan.

Mr. COOPER: Then why are they calling them in for \$200 worth of repairs?

Mr. KYLE: This may not have been the machine that was tested.

Mr. PASCOE: A witness for a machine company at an earlier hearing said that his company bore the cost of testing their machines. This would have to be added to their overhead costs and their selling price. Could one of the witnesses indicate how these testing operations are financed?

Mr. KYLE: Yes, and I am very glad that point came up, as it might be worthy of consideration. The testing organization is financed wholly and completely by the government of Saskatchewan at the moment.

Mr. HORNER (*Acadia*): Did you not say that Alberta contributed also?

Mr. KYLE: Yes, I am sorry; this is the first year. Alberta has contributed this year.

Mr. MANDZIUK: You are in the driver's seat, though?

Mr. KYLE: It is financed by the Saskatchewan government and paid for by the Saskatchewan government with a contribution from Alberta this year. However, it is the company that submits a machine for testing. If the machine is on the market, that is, if farm people can buy it, there is no testing fee. We do not charge the manufacturer a testing fee.

Mr. PASCOE: But the manufacturer supplies the machine?

Mr. KYLE: Yes, the manufacturer supplies the machine. I think they do not supply the fuel, as is the case in Nebraska in the testing of tractors, where the standard type of fee would be in the order of \$1,200 or \$1,300 per tractor. There is no fee in the A.M.A. organization, provided the machine is on the market. They provide the machine; they maintain the machine during the time it is tested. In the case of any failures that occur, they replace the parts, and so on.

As a witness from Massey-Ferguson indicated, they also come up from time to time with their engineering staff and observe the testing and so on. I might add one point in clarifying this. In terms of dollars, it might be worthy of note that the company which made this observation to the committee has, up to and including 1960—not this year—provided something in the order of \$4,000 of retail value of farm equipment to be tested by A.M.A. What the deterioration or depreciation might be on this is open to conjecture.

Mr. HORNER (*Acadia*): In other words, they have not provided too many machines for testing?

Mr. KYLE: Four machines altogether.

Mr. NOLLET: They have not put up many?

Mr. KYLE: They have up to \$2,000 in terms of cost. It might be small, certainly, in terms of the percentage they manufacture.

Mr. FORBES: Do you give this machine to a farmer who carries out the work with it, or do you put a man on it to do the work?

Mr. KYLE: It is a kind of cross between both of these methods. There is a man in the field when this machine is put to work, but for a very high percentage of the hours of work, probably 80 to 90 per cent or even higher—

all the operation is carried out by the farm people and they are actually driving these machines right on their own farms.

Mr. FORBES: The farmer would pay for the fuel for the tractor?

Mr. KYLE: Yes, that is the arrangement we usually make. The farmer would pay for the fuel. He leaves in his own machine and uses this one instead—a swathing machine, or lifting machine, or whatever it is.

Mr. HORNER (*Jasper-Edson*): Would Mr. Kyle be kind enough to leave with our committee a copy of the Saskatchewan act and regulations, so that we might have them combined with the minutes of today's meeting? I think it might be helpful.

Mr. HORNER (*Acadia*): I have a question. According to a remark which you made earlier, am I right in assuming that some companies did not take advantage of this A.M.A. readily, or not to any great extent?

Mr. KYLE: I think that would be a fair statement, yes.

Mr. HORNER (*Acadia*): Did any of these companies? I am referring to the three large companies who were named here earlier, that is, John Deere, the International, and Massey-Ferguson?

Mr. KYLE: I must be entirely fair in answering this question.

Mr. NOLLET: We could not handle them all if they did come, and I think they are aware of it.

Mr. KYLE: There has been some reluctance in at least one of these major companies in submitting machines.

Mr. HORNER (*Acadia*): Could this reluctance stem out of the thought which occurred to me when the national farm union mentioned it, when they said at page 21 of their brief:

—its services are beginning to show promise of value in rendering an important service to farm people by providing them with basic information on various lines of farm equipment and guiding them in the proper choice of machinery for their own farming operations.

This is the thing I am asking about. Could it be—and I do not want to cast any reflections on the A.M.A.—but could it be so? We have seen here that the Saskatchewan government has a tendency or a favouritism towards C.C.I.L. machinery.

Mr. NOLLET: Oh no.

Mr. HORNER (*Acadia*): I thought you stated it, Mr. Kyle. I do not want to put the record wrong. But did you not state that you try to purchase where you have equal tenders, and that you always favour C.C.I.L. machines? Is that not on the record?

Mr. NOLLET: I want to make this very clear concerning the agency and the reason we set it up. It was set up under special legislation to give to the agency the same legislative protection that we have as members, for any statements that are made, and which we want to be objective. I refer to statements that would be made in these reports. We say all along that if a machine is to be reported upon, it must be done objectively, after having gone through the stresses and strains of testing. The report is made on that basis.

Mr. HORNER (*Acadia*): I am not quite clear, but this is the point I have been wondering about: if the Saskatchewan government is given a choice, and if the machines are all equal, you naturally choose one. You stated that this report was absolutely objective and independent. But do you not think that this might be the cause of some reluctance on the part of the machine companies to submit their machines to your testing?

Mr. KYLE: I do not think so.

Mr. HORNER (*Acadia*): My other thought is that cost is the main item.

Mr. KYLE: No, I do not think so, because we think in terms of the total amount of the investment they have made. My personal opinion is that any reluctance that has been shown has been very limited. It was reluctance on the part of the manufacturer to have a published report in the hands of farm people, stemming from some particular problem or area. That may or may not be your opinion, but it is mine.

Mr. HORNER (*Acadia*): I have no opinion about A.M.A. I know very little about it. I see in the case of one report that the A.M.A. tested a baler with 31,000 bales. If you should test any other baler, would you put it through the same number of bales rigidly in order to try to come up with a fair comparison? And in the case of a discer, if you had 100 acres, and you tested that discer on those 100 acres, would you try to test another discer under similar conditions?

Mr. NOLLET: Yes.

Mr. HORNER (*Acadia*): I know that when you had a double disc and a single disc, the double discs were not too good on heavy land, and they pulled up pretty bad in wet land and so on. Would you try to work these in?

Mr. KYLE: Yes. This is all set out specifically. We certainly cannot take any glory for a good deal of this area. These test techniques have pretty well all been worked out in general terms by other testing organizations like the United Kingdom organization. Certainly the general testing procedures seek very very carefully to do just what you suggest, that is to make sure there is nothing unfair about it.

Mr. NOLLET: The A.M.A. have this comparison machine by which they can compare all other machines.

Mr. FORBES: Did I understand you to say that you purchased some of these machines?

Mr. NOLLET: It is an A.M.A. machine. This is a completely independent agency.

Mr. HORNER (*Acadia*): With regard to any one year's operation, could you give us the number of machines A.M.A. would test and the cost to the Saskatchewan and Alberta governments.
